"It will run," he said coldly. "Those two plugs in the crankcase may come out at any time. I've tightened them a little. They'd worked loose from the vibration. But—well.... That Service man was heading for Asunción. He'd been found out. They probably shot him down in mid-air after he'd gotten away. His plane may be crashed anywhere in the jungle within a mile or so. And I've two bearings on the *fazenda* where Ribiera went, now. One from Asunción through here

and one from Rio. I want to go back there to-night and dump burning gasoline on the buildings, to do enough damage to disorganize things a little. Then I'm going to try to make it to a seaport. We can stow away, perhaps."

He shut off the motor.

"We'll start at dusk. There'll be lights there. This report says it's nearly a city—of slaves. We want the darkness for our getaway."

Paula looked at the sky.

"We have three hours," she said quietly. "Let us cook and eat. You must keep up your strength, Charles."

She said it in all seriousness, with the air of one who has entire confidence and is merely solicitous. And Bell, who knew of at least three excellent reasons why neither of them should survive until dawn—Bell looked at her queerly, and then grinned, and then took her in his arms and kissed her. She seemed to like it.

And they lunched quite happily on *piranha* and *pacu*—which is smaller—and drank water, and for dessert had more *piranha*.

The long afternoon wore away slowly. It was hot, and grew blistering. Insects came in swarms and tormented them until Bell built a second and larger smudge fire. But they fastened upon his flesh when he went out of its smoke for more wood.

They talked, as well as they could for smoke, and looked at each other as well as they could for smarting eyes. It was not at all the conventional idea of romantic conversation, but it was probably a good deal more honest than most, because they both knew quite well that their chance of life was small. A plane whose motor was precariously patched, flying over a jungle without hope of a safe landing if that patched-up motor died, was bad enough. But with the three nearest nations subservient to The Master, whose deputy Ribiera was, and all those nations hunting them as soon as they were known to be yet alive....

"Would it not be wise, Charles," asked Paula wistfully,

"just for us to try to escape, ourselves, and not try—"

"Wise, perhaps," admitted Bell, "but I've got to strike a blow while I can." He was staring somberly at the little plane, fast upon a mud bank, with the tall green jungle all about. "The deputies and all their slaves have their lives hanging by a thread—the thread of a constant supply of the antidote to the poison that's administered with the antidote. The deputies—Ribiera, for instance—don't realize that. Else they wouldn't dare do the things they do. But let them realize that the thread can be broken, and what their slaves would do to them before they all went mad.... You see? Let them learn that a blow has been struck at the center of all the ghastly thing, and they'll be frightened. They'll be close to mutiny through sheer panic. And there may be slip-ups."

It was vague, perhaps, but it was true. The subjection of the poisoned men and women was due not only to terror of what would happen if they disobeyed the deputies, but to a belief that that thing would not happen if they did obey. If Bell could do enough damage to the *fazenda* of The Master to shake the

second belief, he would have shaken the whole conspiracy. And a conspiracy that is not a complete success is an utter failure.

It was close to sunset when they heard a droning noise in the distance. Bell went swiftly to the cockpit of the plane and searched the sky.

"Don't see it," he said grimly, "and it probably doesn't see us. We're all right, I suppose."

But he was uneasy. The droning noise grew to a maximum and slowly died away again. It diminished to a distant muttering.

"What say," said Bell suddenly, "we get aloft now? We'll follow that damned thing home. It's going from Asunción to that place we want to find. This is on that route. Whoever's in it won't be looking behind, and it's close to darkness."

Paula stood up.

"I am ready, Charles."

Bell swung out on the floats and tugged at the prop. The motor caught and roared steadily. While it was warming up, he stripped off the rest of his shirt and tore it into wide strips, and tied the rags in the handles of the gasoline tins in the two cockpits.

"For our bombs," he explained, smiling faintly. "You'll want to wear your chute pack, Paula. You know how to work it? And we'll divide the guns and what shells we have, and stick them in the flying suit pockets."

He made her show him a dozen times that she knew how to pull out the ring that would cause the parachute to open. She climbed into the front cockpit and smiled down at him. He throttled down the motor to its lowest speed and shoved off from the mud bank. Clambering up, while the plane moved slowly over the water under the gentle pull of the slow-moving propeller, he bent over and kissed her.

"For luck," he said in her ear.

The next instant he settled down at the controls, glanced a last time at the instruments, and gave the

motor the gun.

The plane lifted soggily but steadily and swept upstream toward the rolling water of the *raudal*, which tumbled furiously about an obstacle half of stones and shallows, and half of caught and rotting tree trunks. It rose steadily until the trees dropped away on either side and the jungle spread out on every hand. It rose to a thousand feet and went roaring through the air to northward, while Bell strained his eyes for the plane on ahead.

It was ten minutes or more before he sighted it, winging its way steadily into the misty distance above the jungle. Bell settled down to follow. The engine roared valorously. For half an hour Bell watched it anxiously, but it remained cool and had always ample power. Paula's head showed above the cockpit combing. Mostly she looked confidently ahead, but once or twice she turned about to smile at him.

The sun seemed high when they rose from the water, but as it neared the horizon its rate of descent seemed to increase. They had been in the air for no

more than three-quarters of an hour when it was twice its own disk above the far distant hills. Almost immediately, it seemed, it had halved that distance. And then the lower limb of the blaring circle was sharply cut off by the hill crests and the sun sank wearily to rest behind the edge of the world.

It seemed as if a swift chill breeze blew over the jungle, in warning of the night. The trees became dark. A shadowy dusk filled the air even up to where the plane flew thunderously on. And then, quite abruptly, stars were shining and it was night.

Bell remembered, suddenly, and switched on the radio as an experiment. The harsh, discordant dashes sounded in his ears through the roaring of the motor. A beam of short waves was being sent out from his destination. While he was on the direct path the monotonous signals could be heard. When they weakened or died he would have left the way.

But they continued, discordant and harsh and monotonous, while the last faint trace of the afterglow died away and night was complete, and a roof of

many stars glittered overhead, and the jungle lay dark and deadly below him.

For nearly half an hour more he kept on. Twice he switched on the instrument board light to glance at the motor temperature. The first time it appeared a little high. The second time it was normal again. But there was little use in watching instruments. If the motor failed there was no landing field to make for.

A sudden faint glow sprang into being, many miles ahead. The pinkish glare of many, many lights turned on suddenly. As the plane thundered on the glow grew brighter. An illuminated field, for the convenience of messengers who carried the poison for The Master to all the nations which were to be subjected.

The glow went out as Bell was just able to distinguish long rows of twinkling bulbs, and he saw the harsher, fiercer glow of floodlights. He reached forward and touched Paula's shoulder. Conversation was impossible over the motor's roar. Her hand reached up and pressed his.

Then he saw other lights. Bright lights, as from houses. Arc lights as from storage warehouses, or something of the sort. A long, long row of lighted windows, which might be dormitories or perhaps sheds in which The Master's enslaved secretaries kept the record of his victims.

The earth flung back the roaring of the little plane's motor. Bell had but little time to act before other planes would dart upward to seek him out. He dived, and the wing tip landing lights went on, sending fierce glares downward. Twin disks of light appeared upon the earth. Sheds, houses, a long row of shacks as if for laborers. A drying field, on which were spread out plants with their leaves turning brown. A wall about it....

"The damned stuff," said Bell grimly.

He swept on. Jungle, only jungle. He banked steeply as lights flicked on and off below and as—once—the wing tip lights showed men running frantically two hundred feet below.

Then a stream of fire shot earthward, and Bell held up his hand and arm into the blast of the slip stream. It blew out the blaze that had licked at his flesh. He stared down. The gas can had left a trailing stream of fluid behind it as it went spinning down to earth. All that stream of inflammable stuff was aflame. The can itself struck earth and seemed to explode, and the trailing mass of fire was borne onward by the wind and lay across a row of thatch-roofed buildings. An incredible sheet of fire spread out. The stuff in the drying yard was burning.

Bell laughed shortly, and flung over another of his flaming bombs, and another, and the fourth....

He climbed for the skies, then, as rectangles of light showed below and planes were thrust out of their lighted hangars. Four huge conflagrations were begun. One was close by a monster rounded tank, and Bell watched with glistening eyes as it crept closer. Suddenly—it seemed suddenly, but it must have been minutes later—flame rushed up the sides of that tank, there was a sudden hollow booming, and fire was flung broadcast in a blazing, pouring flood.

"Their fuel tank!" said Bell, his eyes gleaming in the ruddy light from below. He shut off his landing lights and went upward, steeply. "I've played hell with them now!"

A thousand feet up. Two thousand. Two thousand five hundred.... And suddenly Bell felt cold all over. The instrument board! The motor was hot. Hot! Burning!

He shut it off before it could burst into flames, but he heard the squealing of tortured, unlubricated metal grinding to a stop. He leveled out. It was strangely, terribly silent in the high darkness, despite the roaring of wind about the gliding plane. The absence of the motor roar was the thing that made it horrible.

"Paula," said Bell harshly, "one of those plugs came out, I guess. The motor's ruined. Dead. The ship's going to crash. Ready with your parachute?"

It was dark, up there, save for the glare of fires upon the under surface of the wings. But he saw her hand, encased by that glare, upon the combing of the cockpit. A moment later her face. She turned, light-

dazzled, to smile back at him.

"All right, Charles." Her voice quavered a little, but it was very brave. "I'm ready. You're coming, too?"

"I'm coming," said Bell grimly. Below them was the city of The Master, set blazing by their doing. If their chutes were seen descending.... And if they were not.... "Count ten," said Bell hoarsely, "and pull out the ring. I'll be right after you."

He saw the slim little black-clad figure drop, plummetlike, and prayed in an agony of fear. Then a sudden blooming thing hid it from sight. Thick clouds of smoke lay over the lights and fires below.

Bell stepped over the side and went hurtling down toward the earth in his turn.

Bell was falling head-first when the 'chute opened, and the jerk was terrific, the more so as he had counted not the customary ten, but fifteen before pulling out the ring. But very suddenly he seemed to be floating down with an amazing gentleness, with

the ruddy blossom of a parachute swaying against a background of lustrous stars very far indeed over his head. Below him were masses of smoke and at least one huge dancing mass of flame, where the storage tank for airplane gas had exploded. It was unlikely in the extreme, he saw now, that anyone under that canopy of smoke could look up to see plane or parachute against the sky.

Clumsily enough, dangling as he was, Bell twisted about to look for Paula. Sheer panic came to him before he saw her a little above him but a long distance off. She looked horribly alone with the glare of the fires upon her parachute, and smoke that trailed away into darkness below her. She was farther from the flames than Bell, too. The light upon her was dimmer. And Bell cursed that he had stayed in the plane to make sure it would dive clear of her before he stepped off himself.

The glow on the blossom of silk above her faded out. The sky still glared behind, but a thick and acrid fog enveloped Bell as he descended. Still straining his eyes hopelessly, he crossed his feet and waited.

Branches reached up and lashed at him. Vines scraped against his sides. He was hurled against a tree trunk with stunning force, and rebounded, and swung clear, and then dangled halfway between earth and the jungle roof. It was minutes before his head cleared, and then he felt at once despairing and a fool. Dangling in his parachute harness when Paula needed him.

The light in the sky behind him penetrated even the jungle growth as a faint luminosity. Presently he writhed to a position in which he could strike a match. A thick, matted mass of climbing vines swung from the upper branches not a yard from his fingertips. Bell cursed again, frantically, and clutched at it wildly. Presently his absurd kickings set him to swaying. He redoubled his efforts and increased the arc in which he swung. But it was a long time before his fingers closed upon leaves which came away in his grasp, and longer still before he caught hold of a wrist-thick liana which oozed sticky sap upon his hands.

But he clung desperately, and presently got his whole

weight on it. He unsnapped the parachute and partly let himself down, partly slid, and partly tumbled to the solid earth below.

He had barely reached it when, muffled and many times reechoed among the tree trunks, he heard two shots. He cursed, and sprang toward the sound, plunging headlong into underbrush that strove to tear the flesh from his bones. He fought madly, savagely, fiercely.

He heard two more shots. He fought the jungle in the darkness like a madman, ploughing insanely through masses of creepers that should have been parted by a machete, and which would have been much more easily slipped through by separating them, but which he strove to penetrate by sheer strength.

And then he heard two shots again.

Bell stopped short and swore disgustedly.

"What a fool I am!" he growled. "She's telling me where she is, and I—"

He drew one of the weapons that seemed to bulge in every pocket of his flying suit and fired two shots in the air in reply. A single one answered him.

From that time Bell moved more sanely. The jungle is not designed, apparently, for men to travel in. It is assuredly not intended for them to travel in by night, and especially it is not planned, by whoever planned it, for a man to penetrate without either machete or lights.

As nearly as he could estimate it afterward, it took Bell over an hour to cover one mile in the blackness under the jungle roof. Once he blundered into fire-ants. They were somnolent in the darkness, but one hand stung as if in white-hot metal as he went on. And thorns tore at him. The heavy flying suit protected him somewhat, but after the first hundred yards he blundered on almost blindly, with his arms across his face, stopping now and then to try to orient himself. Three times he fired in the air, and three times an answering shot came instantly, to guide him.

And then a voice called in the blackness, and he

ploughed toward it, and it called again, and again, and at last he struck a match with trembling fingers and saw her, dangling as he had dangled, some fifteen feet from the ground. She smiled waveringly, with a little gasp of relief, and he heard something go slithering away, very furtively.

She clung to him desperately when he had gotten her down to solid earth. But he was savage.

"Those shots—though I'm glad you fired them—may have been a tip-off to the town. We've got to keep moving, Paula."

Her breath was coming quickly.

"They could trail us, Charles. By daylight we might not leave signs, but forcing our way through the night...."

"Right, as usual," admitted Bell. "How about shells? Did you use all you had?"

"Nearly. But I was afraid, Charles."

Bell felt in his pockets. Half a box. Perhaps twenty-five shells. With the town nearby and almost certainly having heard their signals to each other. Black rage invaded Bell. They would be hunted for, of course. Dogs, perhaps, would trail them. And the thing would end when they were at bay, ringed about by The Master's slaves, with twenty-five shells only to expend.

The dim little glow in the sky between the jungle leaves kept up. It was bright, and slowly growing brighter. There was a sudden flickering and even the jungle grew light for an instant. A few seconds later there was a heavy concussion.

"Something else went up then," growled Bell. "It's some satisfaction, anyway, to know I did a lot of damage."

And then, quite abruptly, there was an obscure murmuring sound. It grew stronger, and stronger still. If Bell had been aloft, he would have seen the planes from The Master's hangars being rushed out of their shelters. One of the long row of buildings had caught.

And the plateau of Cuyaba is very, very far from civilization. Tools, and even dynamos and engines, could be brought toilsomely to it, but the task would be terrific. Buildings would be made from materials on the spot, even the shelters for the planes. It would be much more practical to carry the parts for a saw mill and saw out the lumber on the spot than to attempt to freight roofing materials and the like to Cuyaba. So that the structures Bell had seen in the wing lights' glow were of wood, and inflammable. The powerhouse that lighted the landing field was already ablaze. The smaller shacks of the laborers perhaps would not be burnt down, but the elaborate depot for communication by plane and wireless was rapidly being destroyed. The reserve of gasoline had gone up in smoke almost at the beginning, and in spreading out had extended the disaster to nearly all the compact nerve-center of the whole conspiracy.

Presently the droning noise was tumultuous. Every plane in a condition to fly was out on the landing field, now brightly lighted by the burning buildings all about. There was frantic, hectic activity everywhere.

The secretaries of The Master were rescuing what records they could, and growing cold with terror. In the confusion of spreading flames and the noise of roaring conflagrations the stopping of the motor up aloft had passed unnoticed. In the headquarters of The Master there was panic. An attack had been made upon The Master. A person who could not be one of his slaves had found his stronghold and attacked it terribly. And if one man knew that location and dared attack it, then....

The hold of The Master upon all his slaves was based on one fact and its corollary. The fact was, that those who had been given his poison would go murder mad without its antidote. The corollary was that those who obeyed him would be given that antidote and be safe. True, the antidote was but a temporary one, and mixed with it for administration was a further dosage of the poison itself. But the whole power of The Master was based on his slaves' belief that as long as they obeyed him abjectly there would be no failure of the antidote's supply. And Bell had given that belief a sudden and horrible shock.

Orders came from one frightened man, who cursed much more from terror than from rage. Ribiera had advised him. To do him justice, Ribiera felt less fear than most. Nephew to The Master, and destined successor to The Master's power, Ribiera dared not revolt, but at least he had little fear of punishment for incompetence. It was his advice that set the many aircraft motors warming up. It was his direction that assorted out the brainwork staff. And Ribiera himself curtly took control, indifferently abandoned the enslaved workers to the madness that would come upon them, and took wing in the last of a stream of roaring things that swept upward above the smoke and flame and vanished in the sky.

Bell and Paula were huddled in between the buttress roots of a jungle giant, protected on three sides by the monster uprearings of solid wood, and Bell was absorbedly feeding a tiny smudge fire. The smoke was thick and choking, but it did keep off the plague of insects which make jungle travel much less than the romantic adventure it is pictured. Bell heard the heavy, thunderous buzzing from the town change

timbre suddenly. A single note of it grew loud and soared overhead.

He stared up instinctively, but saw nothing but leaves and branches and many climbing things above him, dimly lighted by the smoky little blaze. The roaring overhead went on, and dimmed. A second roaring came from the town and rose to a monstrous growling and diminished. A third did likewise, and a fourth.

At stated, even intervals the planes at headquarters of The Master took off from the landing field, ringed about with blazing buildings, and plunged through the darkness in a straight line. The steadier droning from the town grew lighter as the jungles echoed for many miles with the sounds of aircraft motors overhead.

At last a single plane rose upward and thundered over the jungle roof. It went away, and away.... The town was silent, then, and only a faint and dwindling murmur came from the line of aircraft headed south.

"They've deserted the town, by God!" said Bell, his

eyes gleaming. "Scared off!"

"And—and we—" said Paula, gazing at him.

"You can bet that every man who could crowd into a plane did so," said Bell grimly. "Those that couldn't, if they have any brains, will be trying to make it some other way to where they can subject themselves to one of The Master's deputies and have a little longer time of sanity. The poor devils that are left—well—they'll be *camaradas*, *peons*, laborers, without the intelligence to know what they can do. They'll wait patiently for their masters to come back. And presently their hands will writhe.... And the town will be a hell."

"Then they won't be looking for us?"

Bell considered. And suddenly he laughed.

"If the fire has burned out before dawn," he said coldly, "I'll go looking for them. It's going to be cold-blooded, and it's going to be rather pitiful, I think, but there's nothing else to do. You try to get some rest."

You'll need it."

And for all the rest of the dark hours he crouched in the little angle formed by the roots of the forest giant, and kept a thickly smoking little fire going, and listened to the noises of the jungle all about him.

It was more than a mile back to the town. It was nearer two. But it was vastly less difficult to force a way through the thick growths by daylight, even though then it was not easy. With machetes, of course, Bell and Paula would have had no trouble, but theirs had been left in the plane. Bell made a huge club and battered openings by sheer strength where it was necessary. Sweat streamed down his face before he had covered five hundred yards, but then something occurred to him and he went more easily. If there were any of the intelligent class of The Master's subjects left in the little settlement, he wanted to allow time enough for them to start their flight. He wanted to find the place empty of all but laborers, who would be accustomed to obey any man who spoke arrogantly and in the manner of a deputy of The Master. Yet he did not want to wait too long.

Panic spreads among the *camarada* class as swiftly as among more intelligent folk, and it is even more blind and hysterical.

It was nearly eleven o'clock before they emerged upon a cleared field where brightly blooming plants grew hugely. Bell regarded these grimly.

"These," he observed, "will be The Master's stock."

Paula touched his arm.

"I have heard," she said, and shuddered, "that the men who gather the plants that go to make the poisons of the *Indios* do not—do not dare to sleep near the fresh-picked plants. They say that the odor is dangerous, even the perfume of the blossoms."

"Very probably," said Bell. "I wish I could destroy the damned things. But since we can't, why, we'll go around the edge of the field."

He went upwind, skirting the edge of the planted things. A path showed, winding over half-heartedly

cleared ground. He followed it, with Paula close behind him. Smoke still curled heavily upward from the heaps of ashes which he reached first of all. He looked upon them with an unpleasant satisfaction. He had to pick his way between still smoking heaps of embers to reach the huts about which laborers stood listlessly, not working because not ordered to work, not yet frightened because not yet realizing fully the catastrophe that had come upon them.

He was moving toward them, deliberately adopting an air of suppressed rage, when a voice called whiningly.

"Senhor! Senhor!" And then pleadingly, in Portuguese, "I have news for The Master! I have news for The Master!"

Bell jerked his head about. Bars of thick wood, cemented into heavy timbers at top and bottom. A building that was solid wall on three sides, and the fourth was bars. A white man in it, unshaven, haggard, ragged, filthy. And on the floor of the cage....

There had been another such cage on a *fazenda* back

toward Rio. Bell had looked into it, and had shot the gibbering Thing that had been its occupant, as an act of pure mercy. But this man had been through horrors and yet was sane.

"Don't look," said Bell sharply to Paula. He went close.

The figure pressed against the bars, whining. And suddenly it stopped its fawning.

"The devil!" said the white man in the cage. "What in hell are you doing here, Bell? Has that fiend caught you too?"

"Oh, my God!" gasped Bell. He went white with a cold rage. He'd known this man before. A Secret Service man—one of the seven who had vanished. "How's this place opened? I'll let you out."

[Image description start: A black and white illustration showing Agent Bell recoiling in horror from a row of bars, on the other side of which a man lays on his stomach, reaching through the bars in desperation. Image description end.]

"It may be dangerous," said the white man with a ghastly grin. "I'm one of The Master's little victims. I've been trying to work a little game in hopes of getting within arm's reach of him. How'd you get here? Has he got you too?"

"I burned the damned town last night," snarled Bell, "and crashed up after it. Where's that door?"

He found it, a solid mass of planks with a log bar fitted in such a way that it could not possibly be opened from within. He dragged it wide. The white man came out, holding to his self-control with an obvious effort.

"I want to dance and sing because I'm out of there," he told Bell queerly, "but I know you've done me no good. I've been fed The Master's little medicine. I've been in that cage for weeks."

Bell, quivering with rage, handed him a revolver.

"I'm going to get some supplies and stuff and try to make it to civilization," he said shortly. "If you want to help...."

"Hell, yes," said the white man drearily. "I might as well. Number One-Fourteen was here.... He's The Master's little pet, now. Turned traitor. Report it, if you ever get out."

"No," said Bell briefly. "He didn't turn." He told in a very few words of the finding of the body of a man who had fallen or been thrown from a plane into the jungle.

They were moving toward the rows of still standing shacks, then, and faces were beginning to turn toward them, and there was a little stir of apathetic puzzlement at sight of the white man who had been set free.

That white man looked suddenly at Paula, and then at Bell.

"I've been turned into a beast," he said wryly. "Look here, Bell. There were as many as ten and fifteen of us in that cage at one time—men the deputies sent up for the purpose. We were allowed to go mad, one and two at a time, for the edification of the populace, to keep the *camaradas* scared. And those of us who weren't going mad just then used to have to band together and kill them. That cage has been the most awful hell on earth that any devil ever contrived. They put three women in there once, with their hands

already writhing.... Ugh!..."

Bell's face was cold and hard as if carved from marble.

"I haven't lived through it," said the white man harshly, "by being soft. And I've got less than no time to live—sane, anyhow. I was thinking of shooting you in the back, because the young lady—"

He laughed as Bell's revolver muzzle stirred.

"I'm telling you," said the white man in ghastly merriment, "because I thought—I thought One-Fourteen had set me the example of ditching the Service for his own life. But now it's different."

He pointed.

"There's a launch in that house, with one of these outboard motors. It was used to keep up communication with the boat gangs that sweat the heavy supplies up the river. It'll float in three inches of water, and you can pole it where the water's too shallow to let the propeller turn. This rabble will mob

you if you try to take it, because it'll have taken them just about this long to realize that they're deserted. They'll think you are a deputy, at least, to have dared release me. I'm going to convince them of it, and use this gun to give you a start. I give you two hours. It ought to be enough. And then...."

Bell nodded.

"I'm not Service," he said curtly, "but I'll see it's known."

The white man laughed again.

"Some sigh for the glories of this world, and some for a prophet's paradise to come," he quoted derisively. "I thought I was hard, Bell, but I find I prefer to have my record clean in the Service—where nobody will ever see it—than to take what pleasure I might snatch before I die. Queer, isn't it? Old Omar was wrong. Now watch me bluff, flinging away the cash for credit of doubtful value, and all for the rumble of a distant drum—which will be muted!"

They were surrounded by swarming, fawning, frightened *camaradas* who implored the Senhor to tell them if he were a deputy of The Master, and if he were here to make sure nothing evil befell them. They worked for The Master, and they desired nothing save to labor all their lives for The Master, only—only—The Master would allow no evil to befall them?

The white man waved his arms grandiloquently.

"The Senhor you behold," he proclaimed in the barbarous Portugese of the hinterland of Brazil, "has released me from the cage in which you saw me. He is the deputy of The Master himself, and is enraged because the landing lights on the field were not burning, so that his airplane fell down into the jungle. He bears news of great value from me to The Master, which will make me finally a sub-deputy of The Master. And I have a revolver, as you see, with which I could kill him, but he dares not permit me to die, since I have given him news for The Master. I shall wait here and he will go and send back an airplane with the grace of The Master for me and for all of you."

Bell snarled an assent, in the arrogant fashion of the deputies of The Master. He waited furiously while the Service man argued eloquently and fluently. He fingered his revolver suggestively when a wave of panic swept over the swarming mob for no especial reason. And then he watched grimly while the light little metal-bottomed boat was carried to the water's edge and loaded with food, and fuel, and arms, and ammunition, and even mosquito bars.

The white man grinned queerly at Bell as he extended his hand in a last handshake.

"I, who am about to die, salute you!" he said mockingly. "Isn't this a hell of a world, Bell? I'm sure we could design a better one in some ways."

Bell felt a horrible, a ghastly shock. The hand that gripped his was writhing in his grasp.

"Quite so," said the white man. "It started about five minutes ago. In theory, I've about forty-eight hours. Actually, I don't dare wait that long, if I'm to die like a white man. And a lingering vanity insists on that. I

hope you get out, Bell.... And if you want to do me a favor,"—he grinned again, mirthlessly—"you might see that The Master and as many of his deputies as you can manage join me in hell at the earliest possible moment. I shan't mind so much if I can watch them."

He put his hands quickly in his pockets as the little outboard motor caught and the launch went on downriver. He did not even look after them. The last Bell saw of him he was swaggering back up the little hillside above the river edge, surrounded by scared inhabitants of the workmen's shacks, and scoffing in a superior fashion at their fears.

Chapter 12

It took Bell just eight days to reach the Paraguay, and those eight days were like an age-long nightmare of toil and discomfort and more than a little danger. The launch was headed downstream, of course, and with the current behind it, it made good time. But the distances of Brazil are infinite, and the jungles of Brazil are malevolent, and the route down the Rio Laurenço was designed by the architect of hell.

Raudales lay in wait to destroy the little boat. Insects swarmed about to destroy its voyagers. And the jungle loomed above them, passively malignant, and waited for them to die.

And as if physical sufferings were not enough, Bell saw Paula wilt and grow pale. All the way down the river they passed little clearings at nearly equal distances. And men came trembling out of the little houses upon those *fazendas* and fawned upon the Senhor who was in the launch that had come from up-river and so must be in the service of The Master himself. The clearings and the tiny houses had been placed upon the river for the service of the terribly laboring boat gangs who brought the heavier supplies up the river to The Master's central depot. Men at these clearings had been enslaved and ordered to remain at their posts, serving all those upon the business of The Master. They fawned abjectly upon Bell, because he was of *os gentes* and so presumably was empowered, as The Master had empowered his more intelligent subjects, to exact the most degraded of submission from all beneath him in the horrible

conspiracy. Once, indeed, Bell was humbly implored by a panic stricken man to administer "the grace of The Master" to a moody and irritable child of twelve or so.

"She sees the red spots, Senhor. It is the first sign. And I have served The Master faithfully...."

And Bell could do nothing. He went on savagely. And once he passed a gang of *camaradas* laboring to get heavily loaded dugouts up a fiendish *raudal*. They had ropes out and were hauling at them from the bank, while some of their number were breast-deep in the rushing water, pushing the dugouts against the stream.

"They're headed for the plantation," said Bell grimly, "and they'll need the grace of The Master by the time they get there. And it's abandoned. But if I tell them...."

Men with no hope at all are not to be trusted. Not when they are mixtures of three or more races—white and black and red—and steeped in ignorance and

superstition and, moreover, long subject to such masters as these men had had. Bell had to think of Paula.

He could have landed and haughtily ordered them to float or even carry the light boat to the calmer waters below. They would have obeyed and cringed before him. But he shot the rapids from above, with the little motor roaring past rocks and walls of jungle beside the foaming water, at a speed that chilled his blood.

Paula said nothing. She was white and listless. Bell, himself, was being preyed upon by a bitter blend of horror and a deep-seated rage that consumed him like a fever. He had fever itself, of course. He was taking, and forcing Paula to take, five grains of quinine a day. It had been included among his stores as a matter of course by those who had loaded his boat. And with the fever working in his brain he found himself holding long, imaginary conversations, in which one part of his brain reproached the other part for having destroyed the plantation of The Master. The laborers upon that plantation had been abandoned to the murder madness because of his deed. The caretakers

of the tiny *fazenda* on the river bank were now ignored. Bell felt himself a murderer because he had caused The Master's deputies to cast them off in a callous indifference to their inevitable fate.

He suffered the tortures of the damned, and grew morose and bitter, and could only escape that self torture by coddling his hatred of Ribiera and The Master. He imagined torments to be inflicted upon them which would adequately repay them for their crimes, and racked his feverish brain for memories of the appalling atrocities which can be committed upon the human body without destroying its capacity to suffer.

It was not normal. It was not sane. But it filled Bell's mind and somehow kept him from suicide during the horrible passage of the river. He hardly dared speak to Paula. There was a time when he counted the days since he had been a guest at Ribiera's estate outside of Rio, and frenziedly persuaded himself that he saw red spots before his eyes and soon would have the murder madness come upon him. And then he thought of the supplies in Ribiera's plane, in which

they had escaped from Rio. They had eaten that food.

It was almost unconsciously, then, that he saw the narrow water on which the launch floated valiantly grow wider day by day. When at last it debouched suddenly into a vast stream whereon a clumsy steamer plied beneath a self made cloud of smoke, he stared dully at it for minutes before he realized.

"Paula," he said suddenly, and listened in amazement to his voice. It was hoarse and harsh and croaking. "Paula, we've made it. This must be the Paraguay."

She roused herself and looked about like a person waking from a lethargic sleep. And then her lips quivered, and she tried to speak and could not, and tears fell silently from her eyes, and all at once she was sobbing bitterly.

That sign of the terrific strain she had been under served more than anything else to jolt Bell out of his abnormal state of mind. He moved over to her and clumsily put his arm about her, and comforted her as best he could. And she sat sobbing with her head on

his shoulder, gasping in a form of hysterical relief, until the engine behind them sputtered, and coughed, and died.

When Bell looked, the last drop of gasoline was gone. But the motor had served its purpose. It had run manfully on an almost infinitesimal consumption of gasoline for eight days. It had not missed an explosion save when its wiring was wetted by spray. And now....

Bell hauled the engine inboard and got out the oars from under the seats. He got the little boat out to mid-stream, and they floated down until a village of squalid huts appeared on the eastern bank. He landed, there, and with much bargaining and a haughty demeanor disposed of the boat to the skipper of a *batelao* in exchange for passage down-river as far as Corumba. The rate was outrageously high. But he had little currency with him and dared go no farther on a vessel which carried a boat of The Master's ownership conspicuously towed behind.

At Corumba he purchased clothes less obviously of *os gentes*, both for himself and for Paula, and that same

afternoon was able to arrange for their passage to Asunción as deck passengers on a river steamer going downstream.

It was as two peasants, then, that they rode in sweltering heat amid a swarming and odorous mass of fellow humanity downstream. But it was a curious relief, in some ways. The people about them were gross and unwashed and stupid, but they were human. There was none of that diabolical feeling of terror all about. There were no strained, fear haunted faces upon the deck reserved for deck passengers and other cattle. The talk was ungrammatical and literal and of the earth. The women were stolid-faced and reserved. But when the long rows of hammocks were slung out in the open air, in the casual fashion of sleeping arrangements in the back-country of all South America, it was blessedly peaceful to realize that the folk who snored so lustily were merely human; human animals, it might be, with no thought above their *farinha* and *feijos* on the morrow, but human.

And the second day they passed the old fort at

Coimbra, and went on. The passage into Paraguayan territory was signalized by an elaborate customs inspection, and three days later Asunción itself displayed its red-tiled roofs and adobe walls upon the shore.

Bell had felt some confidence in his ability to pass muster with his Spanish, though his Portuguese was limited, and it was a shock when the captain of the steamer summoned him to his cabin with a gesture, before the steamer docked. Bell left Paula among the other deck passengers and went with the peasant's air of suspicious humility into the captain's quarters. But the captain's pose of grandeur vanished at once when the door closed.

"Señor," said the steamer captain humbly, "I have not spoken to you before. I knew you would not wish it. But tell me, senor! Have you any news of what The Master plans?"

Bell's eyes flickered, at the same time that a cold apprehension filled him.

"Why do you speak to me of The Master?" he demanded sharply.

The steamer captain stammered. The man was plainly frightened at Bell's tone. Bell relaxed, his flash of panic for Paula gone.

"I know," said the captain imploringly, "that the great *fazenda* has been deserted. On my last trip, down, senor, I brought many of the high deputies who had been there. They warned me not to speak, senor, but I saw that you were not what you seemed, and I thought you might be going about to see who obeyed The Master's orders...."

Bell nodded.

"That is my mission," he said curtly. "Do not speak of it further—not even to the deputy in Asunción."

The captain stammered again.

"But I must see the Señor Francia," he said humbly. "I report to him after every trip, and if he thought that I

did not report all that I learn...."

"It is my order," snapped Bell angrily. "If he reproaches you, say that one who has orders from The Master himself gave them to you. And do not speak of the destruction of the *fazenda*. I am searching especially for the man who caused it. And—wait! I will take your name, and you shall give me—say—a thousand pesos. I had need of money to bribe a fool I could not waste time on, up-country. It will be returned to you."

And again the captain stammered, but Bell stared at him haughtily, and he knelt abjectly before the ship's safe.

Asunción, as everybody knows, is a city of sixty thousand people, and the capital of a republic which enjoyed the rule of a family of hereditary dictators for sixty years; which rule ended in a war wherein four-fifths of the population was wiped out. And since that beginning it has averaged eight revolutions to Mexico's three, has had the joy of knowing seven separate presidents in five years—none of them

elected—and now boasts a population approximately two-thirds illegitimate and full of pride in its intellectual and artistic tastes.

Bell and Paula made their way along the cobbled streets away from the river, surrounded by other similarly peasant-seeming folk. Bell told her curtly what had happened with the steamer captain.

"It's the devil," he said coldly, "because this whole republic is under The Master's thumb. Except among the peasants we can count on nearly everybody being on the lookout for us, if they so much as suspect we're alive. And they may because I burned their damned *fazenda*. So...."

Paula smiled at him, rather wanly.

"What are you going to do, Charles?"

"Get a boat," said Bell curtly. "One with three or four men, if I can. If I can buy it with the skipper's money, I will. But I can't take you to go bargaining. It would look suspicious."

They had reached the central plaza of the town. The market swarmed with brown skinned folk and seemed to overflow with fruits. A man was unconcernedly shoveling oranges out of a cart with a shovel, as if they had been so much coal. A market woman as unconcernedly dropped some of the same golden fruit within a small pen where a piglet awaited a purchaser. To the left, there were rows of unshaded stalls where the infinitely delicate handmade Paraguayan lace was exposed for sale.

"I—think," said Paula, "I think I will go in the cathedral. I will be very devout, Charles, and you will find me there when you return. I will be safe there, certainly."

He walked with her across the crowded plaza. He should have known that your peasant does not stride with head up, but regarding the ground. That a man who works heavily droops his shoulders with weariness at the end of a day. And especially he should have realized that Paraguay is not, strictly speaking, a Latin-American nation. It is Latin-Indian, in which the population graduates very definitely

from a sub-stratum of nearly or quite pure Indian race to an aristocracy of nearly or quite pure Spanish descent, and that the color of a man's skin fixes his place in society. Both Bell and Paula were too light of skin for the peasant's clothes they wore. They aroused curiosity at once. If it was not an active curiosity, it was nevertheless curiosity of a sort.

But Bell left her in the shadowy, cool interior of the cathedral which seems so pitifully small to be the center of religion for a nation. He saw her move toward one of the little candle-lit niches in the wall and fall quite simply on her knees there.

And he moved off, to wander aimlessly down to the river shore and stare about and presently begin a desultory conversation with sleepy boatmen.

It was three hours and more before he returned to the Cathedral, and Paula was talking to someone. More, talking to a woman in the most discreet of mantilla'd church-going costumes. Paula saw him in the doorway, and uttered a little cry of relief. She came hurrying to him.

"Charles! I have found a friend! Isabella Ybarra. We were schoolmates in the United States and she has just come back from Paris! So you see, she cannot—"

"I see," said Bell very quietly.

Paula was speaking swiftly and very softly.

"We went to school together, Charles. I trust her. You must trust her also. There is no danger, this time. Isabella has never even heard of The Master. So you see...."

"I see that you need someone you can trust," said Bell grimly. "*I* found that the captain of the steamer had gone to The Master's deputy here. While I was talking to some boatmen a warning was given to look out for a man and woman, together, who may try to buy a boat. We're described, and only the fact that I was alone kept me from being suspected. Police, soldiers—everybody is looking out for us. Paraguay's under The Master's thumb more completely than any other nation on the continent."

The figure to which Paula had been talking was moving slowly toward them. A smiling, brown-eyed face twinkled at them.

"You must be Charles!" said a warm and cluckling voice. "Paula has raved, Señor. Now I am going to take her off in my carriage. She is my maid. And you will follow the carriage on foot and I will have the major-domo let you in the servants' entrance, and the three of us will conspire."

It was incongruous to hear the English of a girl's finishing school from the mantilla'd young woman who beamed mischievously at him. She had the delighted air of one aiding a romance. It was doubly incongruous because of the dark and shadowy Cathedral in which they were, and the raucous noises of the market in the plaza without. Bell had a sense of utter unreality as Isabella's good humored voice went on:

"Do you remember, Paula, the time the French teacher caught us in the pantry? I shall feel just like that time."

"This is dangerous," said Bell, steadily, "and it is very serious indeed."

"Pooh!" said Isabella comfortably. "Paula, you didn't even know I was married! A whole year and a half! And he's a darling, really. I'm the Señora Isabella Ybarra de Zuloaga, if you please! Bow gracefully!" She chuckled. "Jaime came all the way to Rio to meet me last month. I'm wild about him, Paula.... But come on! Follow me humbly, like a nice little *mestizo* girl who wants to be my maid, and I'll let you ride with the *cochero* and Charles shall follow behind us."

She swept out of the Cathedral with the air of a grande dame suppressing a giggle, and Paula went humbly behind her.

And Bell trudged through the dust and the blistering sun while the highly polished carriage jolted over cobble stones and the youthful Señora Isabella Ybarra de Zuloaga beamed blissfully at the universe which did not realize that she was a conspirator, and Paula sat modestly beside the brown skinned *cochero*.

It was not a long ride nor a long walk, though the sun was insufferable. The capital of Paraguay is not large. It is a sleepy, somnolent little town in which the most pretentious building was begun as the Presidential Palace and wound up as the home of a bank. But there are bullet marks on the façade of the *Museo Nacional*, and there is still an empty pedestal here and there throughout the city where the heroes of last year's revolution, in bronze, have been pulled down and the heroes of this year's uprising of the people have not yet been set up. Red tiled roofs give the city color, and the varying shades of its populace give it variety, and the fact that below the whiter class of inhabitants *Guarani* is spoken instead of Spanish adds to the individuality of its effect.

But the house into which the carriage turned could have been built in Rio or Buenos Aires without comment on its architecture. It had the outer bleakness of most private homes of South America, but if it was huge and its windows were barred, the patio into which Bell was ushered by a bewildered and suspicious major-domo made up in color and in

charm for all that the exterior lacked.

A fountain played amid flowers, and macaws and parrots and myriad other caged birds hung in their cages about the colonnade around the court, and Bell found Paula being introduced to a pale young man in the stiff collar and unspeakably formal morning clothes of the South American who is of the upper class.

"Jaime," said Isabella, beaming. "And this is Charles, whom Paula is to marry! It is romantic! It is fascinating! And I depend on you to give him clothes so that all our servants won't stare goggle-eyed at him, and I am going to take Paula off at once and dress her! They are our guests! And, Jaime, you must threaten all the servants terribly so they will keep it very secret—that we have two such terrible people with us."

Paula smiled at Bell, and he saw that she felt utterly safe and wholly at peace. Something was hammering at Bell's brain, warning him, and he could not understand what it was. But he exchanged the

decorous limp handshake which is conventional south of Panama, and followed his unsmiling host to rooms where a servant laid out a bewildering assortment of garments. They were all rather formal, the sort of clothing that is held to be fitting for a man of position where Spanish is the official if not the common tongue.

His host retired, without words, and Bell came out later to find him sipping moodily at a drink, waiting for him. He wiped his forehead.

"Be seated, Señor," he said heavily, "until the ladies join us."

He wiped his forehead again and watched somberly while Bell poured out a drink.

"Isabella...." He seemed to find it difficult to speak.

"She has told me a little, but there has been no time for more than a little: I do not wish to have her tell me too much. She does not understand. She was educated in North America, where customs are different. She demands that I assist you and the

senorita—it is the senorita?"

Bell stiffened. In all Spanish America the conventions are strict. For a man and woman to travel together, even perforce and for a short distance, automatically damns the woman.

"Go on," said Bell grimly.

His host was very pale indeed.

"She demands that I assist you and the senorita to escape the police and the government. Provided that you do not tell me who you are, I will attempt it. But —"

"I wonder," said Bell quietly, "if you have ever seen red spots dancing before your eyes."

His host went utterly livid.

Zuloaga looked down at his hands, as if expecting unguessable things of them. And then he shrugged, and said harshly:

"I have, Señor. So you see that Isabella, who does not know, is asking me to risk, not only my life, but her honor."

Bell said nothing for a moment. He was a little pale.

"And your honor?" he asked quietly.

The pallor on the face of the Señor Jaime Zuloaga was horrible. He tried to speak, and could not. He stood up, and managed to say:

"So much I will risk, because you have been my guest. Until to-morrow morning you are safe, unless the Señor Francia has his spies within my own house. I—I will attempt, even to procure a boat. But—"

Something made Bell turn. The major-domo was moving quickly out of sight. Like a flash Bell was upon him, and like a flash a knife came out.

Bell's host gasped. The fact that his servant had spied was more than obvious, and he had spoke treason against The Master. He leaned against the table, sick

and trembling and mumbling of despair, while there were crashes in the room into which Bell had plunged, while bodies thrashed about on the floor, and while stertorous breathing grew less, and stopped....

Bell came back, breathing hard. The front of his coat was slashed open.

"He's dead," he said harshly. "He'd have reported what you said, so I killed him.... And now we've got to do something with his body."

He helped in the horrible task, while his host grew more and more shaken. No other servants came near. And Bell could almost read the thoughts that went through Zuloaga's brain. One servant had spied, to report his treason. And that meant assassination for himself, as the least of punishments, and for his wife....

But there would be no punishment if he went first to the deputy and said that Bell had killed the major-domo.

Bell left the house before dusk, desperately determined to steal a craft of some sort, return for Paula, and get away from Asunción before dawn.

He returned after an hour. In the morning a man would be found bound and gagged, with five hundred pesos stuffed into his pockets. His boat would have vanished.

But there was a commotion before the house where Paula waited fearfully. A carriage stood there, with a company of mounted soldiers about it. Someone was being put into it. As Bell broke into a run toward the house the carriage started up and the soldiers trotted after it.

Paula was taken.

Chapter 13

That night Bell turned burglar. To attempt a rescue of Paula was simply out of the question. He was entirely aware that he would be expected to do just such a thing, and that it would be adequately guarded

against. Therefore he prepared for a much more desperate enterprise by burglarizing a bookstore in the particularly neat method in which members of The Trade are instructed. The method was invented by a member of The Trade who was an ex-cabinet maker, and who perished disreputably. He killed a certain courier of a certain foreign government, thereby preventing a minor war and irritating two governments excessively, and was hanged.

The method, of course, is simplicity itself. One removes the small nails which hold the molding of a door panel in place. The molding comes out. So does the panel. One enters through the panel, commits one's burglary, and comes out, replacing the molding and the nails with reasonable care. Depending upon the care with which the replacing is done, the means of entrance is more or less undiscoverable. But it is usually used when it is not intended that the burglary ever be discussed.

Bell abstracted two books, wrapping paper and twine. He departed, using great care. He walked three miles out of town and to the banks of the Paraguay. There

he carefully saturated the pages of both books in water, carefully keeping the bindings from being wetted. Then he tore one book to pieces, saving the leaves and inserting them between the leaves of the other book. Then, with a brazil nut candle for illumination, he began to write.

You see, when two thoroughly wetted pieces of paper are placed one above the other with a hard surface such as the cover of another book under them, you can write upon the top one with a stick. The writing will show dark against the gray of the saturated paper. You then remove the top sheet and end the writing reproduced on the bottom sheet. And then you can dry the second sheet and find the marking vanished—until it is wetted again. It is, in fact, a method of water-marking paper. And it is the simplest of all methods of invisible writing.

Bell wrote grimly for hours. The book he had chosen was an old one, an ancient copy of one of Lope de Vega's plays, and the pages were wrinkled and yellow from age alone. When, by dawn, the last page was dried out, there was no sign that anything other than

antiquity had affected the paper. And Bell wrapped it carefully, and addressed it to an elderly senora of literary tastes in San Juan, Porto Rico, and enclosed an affectionate letter to his very dear aunt, and signed it with an entirely improbable name.

It was mailed before sunrise, the necessary stamps having been filched from the burglarized bookstore and the price thereof being carefully inserted in the till. Bell had made a complete and painstaking report of every fact he had himself come upon in the matter of The Master and his slaves and appended to it a copy of the report of the dead Secret Service operative Number One-Fourteen. He destroyed that after copying it. And he concluded that since he had been given dismissal by Jamison in Rio, he considered himself at liberty to take whatever steps he saw fit. And since the Senhorina Paula Canalejas had been kidnapped by agents of The Master, he intended to take steps which might possibly bring about her safety, but would almost certainly cause his death.

The report should at least be of assistance if the Trade set to work to combat The Master. Bell had no

information whatever about that still mysterious and still more horrible person himself. But what he knew about The Master's agents he sent to a lady in Porto Rico who has an astonishingly large number of far ranging nephews. And then Bell got himself adequately shaved, bought a hearty breakfast, and, after one or two heartening drinks, was driven grandly to the residence of the Señor Francia, deputy of The Master for the republic of Paraguay.

The servants who admitted him gazed blankly when he gave his name. A door was hastily closed behind him. He was ushered into an elaborate reception room and, after an agitated pause, no less than six separate frock-coated persons appeared and pointed large revolvers at him while a seventh searched him exhaustively. Bell submitted amusedly.

"And now," he said dryly, "I suppose the Señor Francia will receive me?"

There was more agitation. The six men remained; with their weapons pointed at him. The seventh departed, and Bell re-dressed himself in a leisurely

fashion.

Ten minutes later a slender, dark skinned man with impeccably waxed moustaches entered, regarded Bell with an entirely impersonal interest, took one of the revolvers from one of the six frock-coated gentlemen, and seated himself comfortably. He waved his hand and they filed uneasily from the room. So far, not one word had been spoken.

Bell retrieved his cigarette case and lighted up with every appearance of ease.

"I have come," he said casually, "to request that I be sent to The Master. I believe that he is anxious to meet me."

The dark eyes scrutinized him coldly. Then Francia smiled.

"*Pero si*," he said negligently, "he is very anxious to see you. I suppose you know what fate awaits you?"

His smile was amiable and apparently quite friendly,

but Bell shrugged.

"I suppose," he said dryly, "he wants to converse with me. I have been his most successful opponent to date, I think."

Francia smiled again. It was curious how his smile, which at first seemed so genuine and so friendly, became unspeakably unpleasant on its repetition.

"Yes." Francia seemed to debate some matter of no great importance. "You have been very annoying, Señor Bell. The Senhor Ribiera asked that you be sent to him. It was his intention to execute you, privately. He described a rather amusing method to me. And I must confess that you have annoyed me, likewise. Since the Cuyaba plantation was destroyed my subjects have been much upset. They have been frightened, and even stubborn. Only last week"—he smiled pleasantly, and the effect was horrible—"only last week I desired the society of a lady who is my subject. And her husband considered that, since the *fazenda* was destroyed, The Master would be powerless to extend his grace before long, in any

event. So he shot his wife and himself. It annoyed me enough to make me feel that it would be a pleasure to kill you."

He raised the revolver meditatively.

"Well?" said Bell coldly.

Francia lowered the weapon and laughed.

"Oh, I shall not do it. I think The Master would be displeased. You seem to have the type of courage he most desires in his deputies. And it may yet be that I shall greet you as my fellow deputy or perhaps my fellow viceroy. So I shall send you to him. I would say that you have about an even chance of dying very unpleasantly or of being a deputy. Therefore I offer you such courtesies as I may."

Bell puffed a cloud of smoke toward the ceiling.

"I'm about out of cigarettes," he said mildly.

"They shall be supplied. And—er—if you would desire

feminine society, I will have some of my pretty subjects...."

"No," said Bell bluntly. "I would like to speak to the Senhorina Canalejas, though."

Francia chuckled.

"She left for Buenos Aires last night. The Senhor Ribiera sent a most impatient message for her to be sent on at once. I regretted it, but he had The Master's authority. I thought her charming, myself."

The skin about Bell's knuckles was white. His hands had clenched savagely.

"In that event," he said coldly, "the only other courtesy I would ask is that of following her as soon as possible."

Francia rose languidly. The revolver dangled by his side, but his grip upon it was firm. He smiled at Bell with the same effect of a horrible, ghastly geniality.

"Within the hour, Señor," he said urbanely. "With the guard I shall place over you it is no harm, I am sure, to observe that The Master is at his retreat in Punta Arenas. You will go there to-morrow, as I go to-night."

He moved toward the door, and smiled again, and added pleasantly:

"The Senhorina was delivered to the Senhor Ribiera this morning."

Matters moved swiftly after that. A servant brought cigarettes and a tray of liquors—which Bell did not touch. There was the sound of movement, the scurrying, furtive haste which seems always to imply a desperate sort of fear. Bell waited in a terrible calmness, while rage hammered at his temples.

Then the clattering of horses' hoofs outside. A carriage was being brought. Soldiers came in and a man beckoned curtly. Bell stuffed his pockets with smokes and followed languidly. He was realizing that there was little pretense of secrecy about the power of The Master's deputy here. Police and soldiers....

But Paraguay, of all the nations of the southern continent, has learned a certain calm realism about governmental matters.

The man who has power is obeyed. The man who has not power is not obeyed. Titles are of little importance, though it is the custom for the man with the actual power eventually to assume the official rank of authority. Since the President in Asunción was no more than a figurehead who called anxiously upon the Señor Francia every morning for instructions concerning the management of the nation, Francia indifferently ignored him whenever he chose and gave orders directly. There would be very little surprise and no disorder whatever when The Master proclaimed Paraguay a viceroyalty of his intended empire.

The carriage went smartly through the cobbled streets with a cavalry escort all about it. An officer sat opposite Bell with his hand on his revolver.

"I am receiving at least the honors of royalty," Bell commented coldly to him, in Spanish.

"Señor," said the officer harshly, "this is the state in which the deputies of The Master were escorted."

He watched Bell heavily, but with the desperate intentness of a man who knows no excuses will be received if his prisoner escapes.

Out of the town to a flying field, where a multi-engined plane was warming up. It was one of the ships that had been at The Master's *fazenda* of Cuyaba, one of the ships that had fled from the burning plantation. Bell was ushered into it with a ceremonious suspicion. Almost immediately he was handcuffed to his seat. Two men took their place behind him. The big ship rolled forward, lifted, steadied, and after a single circling set out to the southeast for Buenos Aires.

The whole performance had been run off with the smoothly oiled precision of an iron discipline exercised upon men in the grip of deadly fear.

"One man, at least," reflected Bell grimly, "has some qualities that fit him for his job."

And then, for hour after hour, the big ship went steadily southeast. It flew over Paraguayan territory for two hours, soaring high over the Lago Ypoa and on over the swampy country that extends to the Argentine border. It ignored that border and all customs formalities. It went on, through long hours of flight, while mountains rose before it. It rose over those mountains and passed over the first railroad line—the first real sign of civilization since leaving Asunción—at Mercedes, and reached the Uruguay river where the Mirinjay joins it. It went roaring on down above the valley of the Rio Uruguay for long and tedious hours more. At about noon, lunch was produced. The two men who guarded Bell ate. Then, with drawn revolvers, they unlocked his handcuffs and offered him food.

He ate, of exactly those foods he had seen them eat. He submitted indifferently to the re-application of his fetters. He had reached a state which was curiously emotionless. If Paula had been turned over to Ribiera that morning, Paula was dead. And just as there is a state of grief which stuns the mind past the

realization of its loss, so there is a condition of hatred which leads to an enormous calmness and an unnatural absence of any tremor. Bell had reached that state. The instinct of self-preservation had gone lax. Where a man normally thinks first, if unconsciously, of the protection of his body from injury or pain, Bell had come to think first, and with the same terrible clarity, of the accomplishment of revenge.

He would accept The Master's terms, if The Master offered them. He would become The Master's subject, accepting the poison of madness without a qualm. He would act and speak and think as a subject of The Master, until his opportunity came. And then....

His absolute calmness would have deceived most men. It may have deceived his guards. Time passed. The Rio de la Plata spread out widely below the roaring multi-engined plane and the vast expanse of buildings which is Buenos Aires appeared far ahead in the gathering dusk. Little twinkling lights blinked into being upon the water and the earth far away. Then one of the two guards touched Bell on the shoulder.

"Señor," he said sharply above the motors' muffled roar, "we shall land. A car will draw up beside the plane. There will be no customs inspection. That has been arranged for. You can have no hope of escape. I ask you if you will go quietly into the car?"

"Why not?" asked Bell evenly. "I went to Señor Francia of my own accord."

The guard leaned back. The city of Buenos Aires spread out below them. The tumbled, congested old business quarter glittered in all its offices, and the broad Avenida de Mayo cut its way as a straight slash of glittering light through the section of the city to eastward. By contrast, from above, the far-flung suburbs seemed dark and somber.

The big plane roared above the city, settling slowly; banked steeply and circled upon its farther side, and dipped down toward what seemed an absurdly small area, which sprang into a pinkish glow on their descent. That area spread out as the descent continued, though, and was a wide and level field when the ship flattened out and checked and

lumbered to a stop.

A glistening black car came swiftly, humming into place alongside almost before the clumsy aircraft ceased to roll. Its door opened. Two men got out and waited. The hangars were quite two hundred yards away, and Bell saw the glitter of weapons held inconspicuously but quite ready.

He stepped out of the cabin of the plane with a revolver muzzle pressing into his spine. Other revolver muzzles pressed sharply into his sides as he reached earth.

Smiling faintly, he took four steps, clambered up into the glistening black car, and settled down comfortably into the seat. The two men who had waited by the car followed him. The door closed, and Bell was in a padded silence that was acutely uncomfortable for a moment. A dome light glowed brightly, however, and he lighted nearly the last of the cigarettes from Asunción with every appearance of composure as the car started off with a lurch.

The windows were blank. Thick, upholstered padding covered the spaces where openings should have been, and there was only the muffled vibration of the motor and the occasional curiously distinct noise of a flexing spring.

"Just as a matter of curiosity," said Bell mildly, "what is the excuse given on the flying field for this performance? Or is the entire staff subject to The Master?"

Two revolvers were bearing steadily upon him and the two men watched him with the unwavering attention of men whose lives depend upon their vigilance.

"You, Señor," said one of them without expression or a smile, "are the corpse of a prominent politician who died yesterday at his country home."

And then for half an hour or more the car drove swiftly, and stopped, and drove swiftly forward again as if in traffic. Then there were many turns, and then a slow and cautious traverse of a relatively few feet. It stopped, and then the engine vibration ceased.

"I advise you, Señor," said the same man who had spoken before, and in the same emotionless voice, "not to have hope of escape in the moment of alighting. We are in an enclosed court and there are two gates locked behind us."

Bell shrugged as there was the clatter of a lock operating. The door swung wide.

He stepped down into a courtyard surrounded by nearly bare walls. It had once been the *patio* of a private home of some charm. Now, however, it was bleak and empty. A few discouraged flowers grew weedily in one corner. The glow of light in the sky overhead assured Bell that he was in the very heart of Buenos Aires, but only the most subdued of rumbles spoke of the activity and the traffic of the city going on without.

"This way," said the man with the expressionless voice.

The other man followed. The chauffeur of the car stood aside as if some formality required him neither

to start the motor or return to his seat until Bell was clear of the courtyard.

Through a heavy timber door. Along a passageway with the odor of neglect. Up stairs which once had been impressive and ornamental. Into a room without windows.

"You will have an interview with the Señorita Canalejas in five minutes," said the emotionless voice.

The door closed, while Bell found every separate muscle in his body draw taut. And while his brain at first was dazed with incredulous relief, then it went dark with a new and ghastly terror.

"They know *yagué*," he heard himself saying coldly, "which makes any person obey any command. They may know other and more hellish ones yet."

He fought for self control, which meant the ability to conceal absolutely any form of shock that might await him. That one was in store he was certain. He paced grimly the length of the room and back again....

Something on the carpet caught his eye. A bit of string. He stared at it incredulously. The end was tied into a curious and an individual knot, which looked like it might be the pastime of a sailor, and which looked like it ought to be fairly easy to tie. But it was one of those knots which wandering men sometimes tie absent mindedly in the presence of stirring events. It was the recognition-knot of the Trade, one of those signs by which men may know each other in strange and peculiar situations. And there were many other knots tied along the trailing length of the string. It seemed as if some nervous and distraught prisoner in this room might have toyed abstractedly with a bit of cord.

Only, Bell drew it through his fingers. Double knot, single knot, double knot.... They spelled out letters in the entirely simple Morse code of the telegrapher, if one noticed.

"RBRA GN ON PLA HRE ST TGT J."

Your old-time telegrapher uses many abbreviations. Your short-wave fan uses more. Mostly they are made

by a simple omission of vowels in normal English words. And when the recognition sign at the beginning was considered, the apparently cryptic letters leaped into meaning.

"RiBeRA GoNe ON PauLA HeRe SiT TiGhT Jamison."

When the door opened again and a terribly pale Paula was ushered in, Bell gave no sign of surprise. He simply took her in his arms and kissed her, holding her very, very close.

Chapter 14

Paula remained in the room with Bell for perhaps twenty minutes, and Bell had the feeling of eyes upon them and of ears listening to their every word. In their first embrace, in fact, he murmured a warning in her ear and she gasped a little whispered word of comprehension. But it was at least a relief to be sure that she was alive and yet unharmed. Francia had been in error when he told Bell of Paula's delivery to the Brazilian to be enslaved or killed as Ribiera found most amusing. Or perhaps, of course, Francia had

merely wanted to cause Bell all possible discomfort.

It was clear, however, blessedly clear and evident, that Paula's pallor was due to nothing more than terror—a terror which was now redoubled because Bell was in The Master's toils with her. Forgetting his warning, she whispered to him desperately that he must try to escape, somehow, before The Master's poison was administered to him. Outside, he might do something to release her. Here, a prisoner, he was helpless.

Bell soothed her, not daring either to confess the plan he had formed of a feigned submission in order to wreak revenge, or to offer encouragement because of the message knotted in the piece of string by Jamison. And because of that caution she came to look at him with a queer doubt, and presently with a terrible quiet grief.

"Charles—you—you have been poisoned like the rest?"

The feeling of watching eyes and listening ears was

strong. Bell had a part to play, and the necessity for playing that part was the greater because now he was forced to hope. He hesitated, torn between the need to play his rôle for the invisible eavesdroppers and the desire to spare Paula.

Her hand closed convulsively upon his.

"V-very well, Charles," she said quietly, though her lips quivered. "If—if you are going to serve The Master, I—I will serve him too, if he will let me stay always near you. But if he—will not, then I can always—die...."

Bell groaned. And the door opened silently, and there were men standing without. An emotionless voice said:

"Señorita, the Señor Ortiz will interview the Señor Bell."

"I'm coming," said Paula quietly.

She went, walking steadily. Two men detached

themselves from the group about the door and followed her. The others waited for Bell. And Bell clenched his hands and squared his shoulders and marched grimly with them.

Again long passages, descending to what must have been a good deal below the surface of the earth. And then a massive door was opened, and light shone through, and Bell found himself standing on a rug of the thickest possible pile in a room of quite barbaric luxury, and facing a desk from which a young man was rising to greet him. This young man was no older than Bell himself, and he greeted Bell in a manner in which mockery was entirely absent, but in which defiance was peculiarly strong. A bulky, round shouldered figure wrote laboriously at a smaller desk to one side.

"Señor Bell," said the young man bitterly, "I do not ask you to shake hands with me. I am Julio Ortiz, the son of the man you befriended upon the steamer *Almirante Gomez*. I am also, by the command of The Master, your jailer. Will you be seated?"

Bell's eyes flickered. The older Ortiz had died by his own hand in the first stages of the murder madness The Master's poison produced. He had died gladly and, in Bell's view, very gallantly. And yet his son.... But of course The Master's deputies made a point of enslaving whole families when it was at all possible. It gave a stronger hold upon each member.

"I beg of you," said young Ortiz bitterly, "to accept my invitation. I wish to offer you a much qualified friendship, which I expect you to refuse."

Bell sat down and crossed his knees. He lit a cigarette thoughtfully, thinking swiftly.

"I remember, and admired, your father," he said slowly. "I think that any man who died as bravely as he did is to be envied."

The younger Ortiz had reseated himself as Bell sat down, and now he fingered nervously, wretchedly, the objects on his desk. A penholder broke between his fingers and he flung it irritably into the wastebasket.

"You understand," he said harshly, "the obligations upon me. I am the subject of The Master. You will realize that if you desire to escape, I cannot permit it. But you did my father a very great kindness. Much of it I was able to discover from persons on the boat. More, from the wireless operator who is also the subject of The Master. You were not acting, Señor, as a secret service operative in your attempt to help my father. You bore yourself as a very honorable gentleman. I wish to thank you."

"I imagine," said Bell dryly, "that anyone would have done what I did."

He seemed to be quite at ease, but he was very tense indeed. The bulky, round shouldered figure at the other desk was writing busily with a very scratchy pen. It was an abominable pen. Its sputtering was loud enough to be noticeable under any circumstances, but Bell was unusually alert, just now, and suddenly he added still more drily:

"Helping a man in trouble is quite natural. One always gets it back. It's a sort of dealing with the

future in which there is a profit on every trade."

He put the slightest emphasis on the last word and waited, looking at young Ortiz, but listening with all his soul to the scratching of the pen. And that scratching sound ceased abruptly. The pen seemed to write smoothly all of an instant. Bell drew a deep breath of satisfaction. In the Trade, when in doubt, one should use the word "Trade" in one's first remark to the other man. Then the other man will ask your trade, and you reply impossibility. It is then up to the other man to speak frankly, first. But circumstances alter even recognition-signs.

Ortiz had not noticed any by-play, of course. It would have been rather extraordinary if he had. A pen that scratches so that the sound is Morse code for "Bell, play up. J." is just unlikely enough to avoid all notice.

Ortiz drummed upon the desk. "Now, Señor, what can I do that will serve you? I cannot release you. You know that. I am not the deputy here. There has been a set-back to The Master's plans and all the deputies are called to his retreat to receive instructions and to

discuss. I have merely been ordered to carry out the deputy's routine labors until he returns. However, I will be obeyed in any matter. I can, and will, do anything that will make you more comfortable or will amuse you, from a change in your accommodations to providing you with companions. You observe," he added with exquisite bitterness, "that the limit of my capacity to prove my friendship is to offer my services as a pander."

Bell gazed at the tip of his cigarette, letting his eyes wander about the room for an instant, and permitting them to rest for the fraction of a second upon the round shouldered, writing form by the side wall.

"I am sufficiently amused," he said mildly. "I asked to be sent to The Master. He intends to make me an offer, I understand. Or he did. He may have changed his mind. But I am curious. Your father told me a certain thing that seemed to indicate he did not enjoy the service of The Master. Your tone is quite loyal, but unhappy. Why do you serve him? Aside, of course, from the fact of having been poisoned by his deputy."

Internally, Bell was damning Jamison feverishly. If he was to play up to Ortiz, why didn't Jamison give him some sign of how he was to do it? Some tip....

"Herr Wiedkind," said Ortiz wearily, "perhaps you can explain."

The round shouldered figure swung about and bowed profoundly to Bell.

"Der Señor Ortiz," he said gutturally, and in a sepulchral profundity, "he does not understand himself. I haff nefer said it before. But he serfs Der Master because he despairs, andt he will cease to serf Der Master when he hopes. And I—I serf Der Master because I hope, andt I will cease to serf him when I despair."

Ortiz looked curiously and almost suspiciously at the Germanic figure which regarded him soberly through thick spectacles.

"It is not customary, Herr Wiedkind," he said slowly, "to speak of ceasing to serve The Master."

"Idt is not customary to speak of many necessary things," said the round shouldered figure dryly. "Of our religions, for example. Of der women we lofe. Of our gonsciences. Of various necessary biological functions. But in der presence of der young man who is der enemy of Der Master we can speak freely, you and I who serf him. We know that maybe der deputies serf because they enjoy it. But der subjects? Dey serf because dey fear. Andt fear is intolerable. A man who is afraid is in an unstable gondition. Sooner or later he is going to stop fearing because he gets used to it —when Der Master will haff no more hold on him—or else he is going to stop fearing because he will kill himself."

To an outsider the spectacle of the three men in their talk would have been very odd indeed. Two men who served The Master, and one who had been his only annoying opponent, talking of the service of The Master quite amicably and without marked disagreement.

Ortiz stirred and drummed nervously on the desk. The round shouldered figure put the tips of its fingers

together.

"How did you know," demanded Ortiz suddenly, "that I serve because I despair?"

Bell watched keenly. He began to see where the talk was trending, and waited alertly for the moment for him to speak. This was a battlefield, this too luxurious room in which young Ortiz seemed an alien. Rhetoric was the weapon which now would serve the best.

"Let us talk frankly," said the placid German voice. "You andt I, Señor Ortiz, haff worked together. You are not a defil like most of the deputies, and I do not regret hafing been sent here to help you. And I am not a scoundtrel like most of those who help the deputies, so you haff liked me a little. Let us talk frankly. I was trapped. I am a capable segretary. I speak seferal languages. I haff no particular ambitions or any loyalties. I am useful. So I was trapped. But you, Señor Ortiz, you are different."

Ortiz suddenly smiled bitterly.

"It is a saying in Brazil, if I recall the words, '*A cauda do demonio e de rendas*.' 'The devil's tail is made of lace.' That is the story."

Bell said quietly:

"No."

Ortiz stared at him. He was very pale. And suddenly he laughed without any amusement whatever.

"True," said Ortiz. He smiled in the same bitterness.

"I had forgotten. I am a slave, and the Herr Wiedkind is a slave, and you, Señor Bell, are the enemy of our master. But I had forgotten that we are gentlemen. In the service of The Master one does forget that there are gentlemen."

He laughed again and lighted a cigarette with hands that shook a little.

"I loved a girl," he said in a cynical amusement. "It is peculiar that one should love any woman, *señores*—or do you, Señor Bell, find it natural? I loved this girl. It

pleased my father. She was of a family fully equal to my own: their wealth, their position, their traditions were quite equal, and it was a most suitable match. Most remarkable of all, I loved her as one commonly loves only when no such considerations exist. It is amusing to me now, to think how deeply, and how truly, and how terribly I loved her...."

Young Ortiz's pallor deepened as he smiled at them. His eyes, so dark as to be almost black, looked at them from a smiling mask of whiteness.

"There was no flaw anywhere. A romance of the most romantic, my father very happy, her family most satisfied and pleased, and I—I walked upon air. And then my father suddenly departed for the United States, quite without warning. He left a memorandum for me, saying that it was a matter of government, a secret matter. He would explain upon his return. I did not worry. I haunted the house of my fiancée. The habits of her family are of the most liberal. I saw her daily, almost hourly, and my infatuation grew. And suddenly I grew irritable and saw red spots before my eyes....

"Her father took me to task about my nervousness. He led me kindly to a man of high position, who poured out for me a little potion.... And within an hour all my terrible unease had vanished. And then they told me of The Master, of the poison I had been given in the house of my fiancée herself. They informed me that if I served The Master I would be provided with the antidote which would keep me sane. I raged.... And then the father of my fiancée told me that he and all his family served The Master. That the girl I loved, herself, owed him allegiance. And while I would possibly have defied them and death itself, the thought of that girl not daring to wed me because of the poison in her veins.... I saw, then, that she was in terror. I imagined the two of us comforting each other beneath the shadow of the most horrible of fates...."

Ortiz was silent for what seemed to be a long time, smiling mirthlessly at nothing. When his lips parted, it was to laugh, a horribly discordant laughter.

"I agreed," he said in ghastly amusement. "For the sake of my loved one, I agreed to serve The Master that I might comfort her. And plans for our wedding,

which had been often and inexplicably delayed, were set in train at once. And the deputy of The Master entertained me often. I plied him with drink, striving to learn all that I could, hoping against hope that there would be some way of befooling him and securing the antidote without the poison.... And at last, when very drunken, he laughed at me for my intention of marriage. He advised me tipsily to serve The Master zealously and receive promotion in his service. Then, he told me amusedly, I would not care for marriage. My fiancée would be at my disposal without such formalities. In fact—while I stood rigid with horror—he sent a command for her to attend him immediately. He commanded me to go to an apartment in his dwelling. And soon—within minutes, it seemed—the girl I loved came there to me...."

Bell did not move. This was no moment to interrupt. Ortiz's fixed and cynical smile wavered and vanished. His voice was harsh.

"She was at my disposal, as an act of drunken friendship by the deputy of The Master. She confessed to me, weeping, that she had been at the disposal of

the deputy himself. Of any other person he cared to divert or amuse.... Oh! *Dios!*"

Ortiz stopped short and said, in forced calmness:

"That also was the night that my father died."

Silence fell. Bell sat very still. The Teutonic figure spoke quietly after the clock had ticked for what seemed an interminable period.

"You didnt know, then, that your father's death was arranged?"

Ortiz turned stiffly to look at him.

"Here," said the placid voice, quaintly sympathetic.

"Look at these."

A hand extended a thick envelope. Ortiz took it, staring with wide, distended eyes. The round shouldered figure stood up and seemed to shake itself. The stoop of its shoulders straightened out. One of the seemingly pudgy hands reached up and

removed the thick spectacles. A bushy gray eyebrow peeled off. A straggly beard was removed. The other eyebrow.... Jamison nodded briefly to Bell, and turned to watch Ortiz.

And Ortiz was reading the contents of the envelope. His hands began to shake violently. He rested them on the desk-top so that he could continue to read. When he looked up his eyes were flaming.

"The real Herr Wiedkind," said Jamison dryly, "came up from Punta Arenas with special instructions from The Master. You have talents, Señor Ortiz, which The Master wished to use. Also you have considerable wealth and the prestige of an honorable family. But you were afflicted with ideas of honor and decency, which are disadvantageous in deputies of The Master. The real Herr Wiedkind had remarkable gifts in eradicating those ideas."

Jamison sat down and crossed his knees carefully.

"I looked you up because I knew The Master had killed your father," he added mildly, "and I thought

you'd either be hunting The Master or he'd be hunting you. My name's Jamison. I killed the real Wiedkind and took his identification papers. He was a singularly unpleasant beast. His idea of pleasure made him seem a fatherly sort of person, very much like my make-up. He was constantly petting children, and appeared very benign. I am very, very glad that I killed him."

Ortiz tore at his collar, suddenly. He seemed to be choking.

"This—this says.... It is The Master's handwriting! I know it! And it says—"

"It says," Jamison observed calmly, "that since your father killed the previous deputy in an attempt to save you from The Master's poison, that you are to be prepared for the work your father had been assigned. Herr Wiedkind is given special orders about your—ah—moral education. In passing, I might say that your father was sent to the United States because it was known he'd killed the previous deputy. He told Bell he'd done that killing. And he was allowed to grow

horribly nervous on his return. He was permitted to see the red spots, because he was officially—even as far as you were concerned—to commit suicide.

"It was intended that his nervousness was to be noticed. And a plane tried to deliver a message to him. Your father thought the parcel contained the antidote to the poison that was driving him mad. Actually, it was very conventional prussic acid. Your father would have drunk it and dropped dead, a suicide, after a conspicuous period of nervousness and worry."

Bell felt his cigarette burning his fingers. He had sat rigid until the thing burned short. He crushed out the coal, looking at Ortiz.

And Ortiz seemed to gasp for breath. But with an almost superhuman effort he calmed himself outwardly.

"I—think," he said with some difficulty, "that I should thank you. I do. But I do not think that you told me all of this without some motive. I abandon the service of

The Master. But what is it that you wish me to do? You know, of course, that I can order both of you killed...."

Bell put down the stub of his cigarette very carefully.

"The only thing you can do," he said quietly, "is to die."

"True," said Ortiz with a ghastly smile. "But I would like my death to perform some service. The Master has no enemies save you two, and those of us who die on becoming his enemies. I would like, in dying, to do him some harm."

"I will promise," said Jamison grimly, "to see that The Master dies himself if you will have Bell and myself put in a plane with fuel to Punta Arenas and a reasonable supply of weapons. I include the Señorita Canalejas as a matter of course."

Ortiz looked from one to the other. And suddenly he smiled once more. It was queer, that smile. It was not quite mirthless.

"You were right, just now," he observed calmly, "when as the Herr Wiedkind you said that I would quit the service of The Master when I ceased to despair. I begin to have hopes. You two men have done the impossible. You have fought The Master, you have learned many of his secrets, and you have corrupted a man to treason when treason means suicide. Perhaps, Señores, you will continue to achieve the impossible, and assassinate The Master."

He stood up, and though deathly pale continued to smile.

"I suggest, Señor, that you resume your complexion. And you, Señor Bell, you will be returned to your confinement. I will make the necessarily elaborate arrangements for my death."

Bell rose. He liked this young man. He said quietly:

"You said just now you wouldn't ask me to shake hands. May I ask you?..." He added almost apologetically as Ortiz's fingers closed upon his: "You see, when your father died I thought that I would be

very glad if I felt that I would die as well. But I think"—he smiled wryly—"I think I'll have two examples to think of when my time comes."

In the morning a bulky, round shouldered figure entered the room in which Bell was confined.

"You will follow me," said a harsh voice.

Bell shrugged. He was marched down long passageways and many steps. He came out into the courtyard, where the glistening black car with the blank windows waited. At an imperious gesture, he got in and sat down with every appearance of composure, as of a man resignedly submitting to force he cannot resist. The thick spectacles of the Herr Wiedkind regarded him with a gogglelike effect. There was a long pause. Then the sound of footsteps. Paula appeared, deathly pale. She was ushered into the vehicle—and only Bell's swift gesture of a finger to his lips checked her cry of relief.

Voices outside. The guttural Spanish of the Herr Wiedkind. Other, emotionless voices replying. The

Herr Wiedkind climbed heavily into the car and sat down, producing a huge revolver which bore steadily upon Bell. The door closed, and he made a swift gesture of caution.

"Idt may be," said the Germanic voice harshly, "that you and the young ladty haff much to say to each other. But idt can wait. And I warn you, *mein Herr*, that at the first movement I shall fire."

Bell relaxed. There was the purring of the motor. The car moved off. Obviously there was some microphonic attachment inside the tonneau which carried every word within the locked vehicle to the ears of the two men upon the chauffeur's seat. An excellent idea for protection against treachery. Bell smiled, and moved so that his lips were a bare half-inch from Paula's ears.

"Try to weep, loudly," he said in the faintest of whispers. "This man is a friend."

But Paula could only stare at the bulky figure sitting opposite until he suddenly removed the spectacles,

and smiled dryly, and then reached in his pockets and handed Bell two automatic pistols, and extended a tiny but very wicked weapon to Paula. He motioned to her to conceal it.

Jamison—moving to make the minimum of noise—handed Bell a sheet of stiff cardboard. It passed into Bell's fingers without a rustle. He showed it silently to Paula.

We were overheard last night by someone. We don't know who or how much he heard. Dictaphone in the room we talked in. Can't find out who it was or what action he's taken. We may be riding into a trap now. Ortiz has disappeared. He may be dead. We can only wait and see.

The car was moving as if in city traffic, a swift dash forward and a sudden stop, and then another swift dash. But the walls within were padded so that no sound came from without save the faint vibration of the motor and now and then the distinct flexing of a spring. Then the car turned a corner. It went more rapidly. It turned another corner. And another....

In the light of the bright dome light, Bell saw beads of sweat coming out on Jamison's face. He did not dare to speak, but he formed words with his lips.

"He's turning wrong! This isn't the way to the field!"

Bell's jaws clenched. He took out his two automatics and looked at them carefully. And then, much too short a time from the departure for the flying field to have been reached, the car checked. It went over rough cobblestones, and Bell himself knew well that there had been no cobbled roadway between the flying field and his prison. And then the car went up a sort of ramp, a fairly steep incline which by the feel of the motor was taken in low, and on for a short distance more. Then the car stopped and the motor was cut off.

Keys rattled in the lock outside. The door opened. The blunt barrel of an automatic pistol peered in.

he door of the car swung wide, and Ortiz's pale grim face peered in behind the blue steel barrel of his automatic. He smiled queerly at Jamison, with a grunt

of relief, tapped Bell's wrist in sign to put away his weapon.

Bell has fought through tremendous obstacles to find and kill The Master, whose diabolical poison makes murder-mad snakes of the hands; and, as he faces the monster at last—his own hands start to writhe!

"Ah, very well," said Ortiz, with the same queer smile upon his face. "One moment."

He disappeared. On the instant there was the thunderous crashing of a weapon. Bell started up, but Jamison thrust him back. Then Ortiz appeared again with smoke still trickling from the barrel of his pistol.

"I have just done something that I have long wished to do," he observed coolly. "I have killed the chauffeur and his companion. You may alight, now. I believe we will have half an hour or more. It will do excellently."

He offered his hand to Paula as she stepped out. She seemed to shudder a little as she took it.

"I do not blame you for shuddering, Senorita," he said politely, "but men who are about to die may indulge in petty spites. And the chauffeur was a favorite with the deputy for whom I am substituting. Like all favorites of despots, he had power to abuse, and abused it. I could tell you tales, but refrain."

The car had come to a stop in what seemed to be a huge warehouse, and by the sound of water round about, it was either near or entirely built out over the harbor. A large section near the outer end was walled off. Boxes, bales, parcels and packages of every sort were heaped all about. Bell saw crated air engines lying in a row against one wall. There were a dozen or more of them. Machinery, huge cases of foodstuffs....

"The Buenos Aires depot," said Ortiz almost gaily. "This was the point of receipt for all the manufactured goods which went to the *fazenda* of Cuyaba, Senor Bell. Since you destroyed that place, it has not been so much used. However, it will serve excellently as a tomb. There are cases of hand grenades yonder. I advise you to carry a certain number with you. The machine guns for the air-craft, with their ammunition,

are here...."

He was hurrying them toward the great walled-off space as he talked, his automatic serving as a pointer when he indicated the various objects.

"Now, here," he added as he unlocked the door, "is your vessel. The Master bought only amphibian planes of late. Those for Cuyaba were assembled in this little dock and took off from the water. Your destruction up there, Senor Bell, left one quite complete but undelivered. I think another, crated, is still in the warehouse. I have been very busy, but if you can fuel and load it before we are attacked...."

They were in a roofed and walled but floorless shed, built into the warehouse itself. Water surged about below them, and on it floated a five passenger plane, fully assembled and apparently ready to fly, but brand new and so far unused.

"I'll look it over," said Bell, briefly. He swung down the catwalk painted on the wings. He began a swift and hasty survey. Soot on the exhaust stacks proved that

the motors had been tried, at least. Everything seemed trim and new and glistening in the cabin. The fuel tanks showed the barest trace of fuel. The oil tanks were full to their filling-plugs.

He swung back up.

"Taking a chance, of course," he said curtly. "If the motors were all right when they were tried, they probably are all right now. They may have been tuned up, and may not. I tried the controls, and they seem to work. For a new ship, of course, a man would like to go over it carefully, but if we've got to hurry...."

"I think," said Ortiz, and laughed, "that haste would be desirable. Herr Wiedkind—No! *Amigo mio*, it was that damned Antonio Calles who listened to us last night. I found pencil marks beside the listening instrument. He must have sat there and eavesdropped upon me many weary hours, and scribbled as men do to pass the time. He had a pretty taste in monograms.... I gave all the orders that were needful for you to take off from the flying field. I even went there myself and gave additional orders. And Calles

was there. Also others of The Master's subjects. My treason would provoke a terrible revenge from The Master, so they thought to prove their loyalty by permitting me to disclose my plan and foil it at its beginning.

"I would have made the journey with you to The Master, but as a prisoner with the tale of my treason written out. So I returned and changed the orders to the chauffeur, when all the Master's loyal subjects were waiting at the flying field. But soon it will occur to them what I have done. They will come here. Therefore, hasten!"

"We want food," said Bell evenly, "and arms, but mostly we want fuel. We'll get busy."

He shed his coat and picked up a hand-truck. He rammed it under a drum of gasoline and ran it to the walkway nearest to the floating plane. Coiled against the wall there was a long hose with a funnel at its upper end. In seconds he had the hose end in one of the wing fuel-tanks. In seconds more he had propped the funnel into place and was watching the gasoline

gurgling down the hose.

"Paula," he said curtly, "watch this. When it's empty roll the drum away so I can put another in its place."

She moved quickly beside it, throwing him a little smile. She set absorbedly about her task.

Jamison arrived with another drum of gas before the first was emptied, and Bell was there with a third while the second still gurgled. They heaped the full drums in place, and Jamison suddenly abandoned his truck to swear wrathfully and tear off his spectacles and fling them against the wall. The bushy eyebrows and beard peeled off. His coat went down. He began to rush loads of foodstuffs, arms, and other objects to a point from which they could be loaded on the plane. Ortiz pointed out the things he pantingly demanded.

In minutes, it seemed, he was demanding: "How much can we take? Any more than that?"

"No more," said Bell. "All the weight we can spare goes for fuel. See if you can find another hose and

funnel and get to work on the other tank. I'm going to rustle oil."

He came staggering back with heavy drums of it. A thought struck him.

"How do we get out? What works the harbor door?"

Ortiz pointed, smiling.

"A button, Senor, and a motor does the rest." He looked at his watch. "I had better see if my fellow subjects have come."

He vanished, smiling his same queer smile. Bell worked frantically. He saw Ortiz coming back, pausing to light a cigarette, and taking up a hatchet, with which he attacked a packing case.

"They are outside, Senor," he called. "They have found the signs of the car entering, and now are discussing."

He plucked something carefully from the packing box

and went leisurely back toward the door. Bell began to load the food and stores into the cabin, with sweat streaming down his face.

There was the sound of a terrific explosion, and Bell jumped savagely to solid ground.

"Keep loading! I'll hold them back!" he snapped to Jamison.

But when he went pounding to the back of the warehouse he found Ortiz laughing.

"A hand grenade, Senor," he said in wholly unnatural levity. "Among the subjects of The Master. I believe that I am going mad, to take such pleasure in destruction. But since I am to die so shortly, why not go mad, if it gives me pleasure?"

He peered out a tiny hole and aimed his automatic carefully. It spurted out all the seven shots that were left.

"The man who poisoned me," he said pleasantly. "I

think he is dead. Go back and make ready to leave, Senor Bell, because they will probably try to storm this place soon, and then the police will come, and then.... It is amusing that I am the one man to whom those enslaved among the city authorities would look for The Master's orders."

Bell stared out. He saw a small horde of people, frantically agitated, milling in the cramped and unattractive little street of Buenos Aires' waterfront. Sheer desperation seemed to impel them, desperation and a frantic fear. They surged forward—and Ortiz flung a hand grenade. Its explosion was terrific, but he had perhaps purposely flung it short. Bell suddenly saw police uniforms, fighting a way through to the front of the crowd and the source of all this disturbance.

"Go back," said Ortiz seriously. "I shall die, Senor Bell. There is nothing else for me to do. But I wish to die with Latin melodrama." He managed a smile. "I will give you ten minutes more. I can hold off the police themselves for so long. But you must hasten, because there are police launches."

He held out his hand. Bell took it.

"Good luck," said Ortiz.

"You can come—" began Bell, wrenched by the gaiety on Ortiz's face.

"Absurd," said Ortiz, smiling. "I should be murder mad within three days. This is a preferable death, I assure you. Ten minutes, no more!"

And Bell went racing back and found Jamison rolling away the last of the fuel drums and Paula looking anxiously for him.

"Tanks full," said Jamison curtly. "Everything set. What next?"

"Engines," said Bell.

He swung down and jerked a prop over. Again, and again.... The motor caught. He went plunging to the other. Minutes.... They caught. He throttled them down to the proper warming up roaring, while the air

in the enclosed space grew foul.

Once more to the warehouse. Ortiz shouted and waved his hand. He was filling his pockets with hand grenades. Bell made a gesture of farewell and Ortiz seemed to smile as he went back to hold the entrance for a little longer.

"We're going," said Bell grimly. "Get your guns ready, Jamison, for when the door goes up."

He pressed on the button Ortiz had pointed out. There were more explosions and the rattle of firearms from the front of the warehouse. There was a sudden rumble of machinery and the blank front of the little covered dock rose suddenly. The sunlit waters of Buenos Aires harbor spread out before them. To Bell, who had not looked on sunlight that day, the effect was dazzling. He blinked, and then saw a fast little launch approaching. There were uniformed figures crowded about its bows.

"All set!" he snapped. "I'm going to give her the gun."

"Go to it," said Jamison. "We're—"

The motors bellowed and drowned out the rest. The plane shuddered and began to move. The sound of explosions from the back of the warehouse was loud and continuous, now. Out into the bright sunlight the plane moved, at first heavily, then swiftly....

Bell saw arms waving wildly in the launch with the uniformed men. Sunlight glittered suddenly on rifle barrels. Puffs of vapor shot out. Something spat through the wall beside Bell. But the roaring of the motors kept up, and the pounding of the waves against the curved bow of the boat-body grew more and more violent.... Sweat came out on Bell's face. The ship was not lifting....

But it did lift. Slowly, very slowly, carrying every pound with which it could have risen from the water. It swept past the police launch at ninety miles an hour, but no more than five feet above the waves. A big, clumsy tramp flying the Norwegian flag splashed up river with its propeller half out of water. Bell dared to rise a little so he could bank and dodge it. He could

not rise above it.

He had one glimpse of blonde, astonished beards staring over the stern of the tramp as he swept by it, his wing tips level with its rail and barely twenty feet away. And then he went on and on, out to sea.

He began to spiral for height fully four miles offshore, and looked back at the sprawling city. Down by the waterfront a thick, curling mass of smoke was rising from one spot abutting on the water. It swayed aside and Bell saw the rectangular opening out of which the plane had come.

"Ortiz's in there," he said, sick at heart. "Dying as he planned."

But there was a sudden upheaval of timbers and roof. A colossal burst of smoke. A long time later the concussion of a vast explosion. There was nothing left where the warehouse had been.

Bell looked, and swore softly to himself, and felt a fresh surge of the hatred he bore to The Master and

all his works. And then filmy clouds loomed up but a little above the rising plane, and Bell shot into them and straightened out for the south.

For many long hours the plane floated on to southward, high above a gray ocean which seemed deceptively placid beneath a canopy of thin clouds. The motors roared steadily in the main, though once Bell instructed Jamison briefly in the maintenance of a proper course and height, and swung out into the terrific blast of air that swept past the wings. He clung to struts and handholds and made his way out on the catwalk to make some fine adjustment in one motor, with six thousand feet of empty space below the swaying wing.

"Carburetter wrong," he explained when he had closed the cabin window behind him again and the motors' roar was once more dulled. "It was likely to make a lot of carbon in the cylinders. O.K., now."

Paula's hand touched his shyly. He smiled abstractedly at her and went back to the controls.

And then the plane kept on steadily. Time and space have become purely relative in these days, in startling verification of Mr. Einstein, and the distance between Buenos Aires and Magellan Strait is great or small, a perilous journey or a mere day's travel, according to the mind and the transportation facilities of the voyager. Before four o'clock in the afternoon the coast was low and sandy to the westward, and it continued sterile and bare for long hours while the plane hung high against the sky with a following wind driving it on vastly more swiftly than its own engines could have contrived.

It was little before sunset when the character of the shore changed yet again, and the sun was low behind a bank of angry clouds when the stubby forefinger of rock that Magellan optimistically named the Cape of the Eleven Thousand Virgins reached upward from the seemingly placid water. Bell swept lower, then, much lower, looking for a landing place. He found it eight or nine miles farther on, on a wide sandy beach some three miles from a lighthouse. The little plane splashed down into tumbling sea and, half supported

by the waves and half by the lift remaining to its wings, ran for yards up upon the hard packed sand.

The landing had been made at late twilight, and Bell moved stiffly when he rose from the pilot's seat.

"I'm going over to that lighthouse," he said curtly.

"There won't be enough men there to be dangerous and they probably haven't frequent communication with the town. I'll learn something, anyway. You two stay with the plane."

Jamison lifted his eyebrows and was about to speak, but looked at Bell's expression and stopped.

Leadership is everywhere a matter of emotion and brains together, and though Jamison had his share of brains, he had not Bell's corroding, withering passion of hatred against The Master and all who served him gladly. All the way down the coast Bell had been remembering things he had seen of The Master's doing. His power was solely that of fear, and the deputies of his selection had necessarily been men who would spread that terror with an unholy zest. The nature of his hold upon his subjects was such that no

honorable man would ever serve him willingly, and for deputies he had need of men even of enthusiasm. His deputies, then, were men who found in the assigned authority of The Master full scope for the satisfaction of their own passions. And Bell had seen what those passions brought about, and there was a dull flame of hatred burning in his eyes that would never quite leave them until those men were powerless and The Master dead.

"You'll look after the ship and Paula," said Bell impatiently. "All right?"

Jamison nodded. Paula looked appealingly at Bell, but he had become a man with an obsession. Perhaps the death of Ortiz had cemented it, but certainly he was unable to think of anything, now, but the necessity of smashing the ghastly hold of The Master upon all the folk he had entrapped. Subconsciously, perhaps, Bell saw in the triumph of The Master a blow to all civilization. Less vaguely, he foresaw an attempt at the extension of The Master's rule to his own nation. But when Bell thought of The Master, mainly he remembered certain disconnected incidents. The girl

at Ribiera's luxurious *fazenda* outside of Rio, who had been ordered to persuade him to be her lover, on penalty of a horrible madness for her infant son if she failed. Of a pale and stricken *fazendiero* on the Rio Laurenço who thought him a deputy and humbly implored the grace of The Master for a moody twelve year old girl. Of a young man who kept his father, murder mad, in a barred room in his house and waited despairingly for that madness to be meted out upon himself and on his wife and children. Of a white man who had been kept in a cage in Cuyaba, with other men....

Bell trudged on through the deepening night with his soul a burning flame of hatred. He clambered amid boulders, guided by the tall lighthouse of Cape Possession with the little white dwelling he had seen at its base before nightfall. He fell, and rose, and forced his way on and upward, and at last was knocking heavily at a trim and neatly painted door.

He was so absorbed in his rage that his talk with the lighthouse keeper seemed vague in his memory, afterward. The keeper was a wizened little Welshman

from the Chibut who spoke English with an extraordinary mixture of a Spanish intonation and a Cimbrian accent. Bell listened heavily and spoke more heavily still. At the end he went back to the plane with a spindle-shanked boy with a lantern accompanying him.

"All settled," he said grimly, when Jamison came out into the darkness with a ready revolver to investigate the approaching light. "We get a boat from the lighthouse keeper to go to Punta Arenas in. He's a devout member of some peculiar sect, and he's seen enough of the hell Punta Arenas amounts to, to believe what I told him of its cause. His wife will look after Paula, and this boy will hitch a team to the plane and haul it out of sight early in the morning. With the help of God, we'll kill Ribiera and The Master before sunset to-morrow."

Chapter 16

But they did not kill The Master before nightfall. It was not quite practicable. Bell and Jamison started out well before dawn with a favorable wind and tide,

in the small launch the wizened Welshman placed at their disposal. His air was one of dour piety, but he accepted Bell's offer of money with an obvious relief, and criticized his Paraguayan currency with an acid frankness until Jamison produced Argentine pesos sufficient to pay for the boat three times over.

"I think," said Jamison dryly, "that Pau—that Miss Canalejas is safe enough until we come back. The keeper is a godly man and knows we have money. She'll be in no danger, except of her soul. They may try to save that."

Bell did not answer. He could think of nothing but the mission he had set himself. He tinkered with the engine to make it speed up, and set the sails with infinite care to take every possible advantage of the stiff breeze that blew. During the day, those sails proved almost as much of a nuisance as a help. The fiendish, sullen williwaws that blow furiously and without warning about the Strait required watching, and more than once it was necessary to reef everything and depend on the motor alone.

Bell watched the horizon ahead with smouldering eyes. Jamison watched him almost worriedly.

"Look here, Bell," he said at last, "you'll get nowhere feeling like you do. I know you've done The Master more damage than I have, but you'll just run your head into a trap unless you use your brains. For instance, you didn't ask about communications. There's a direct telegraph wire from Cape Virgins to Buenos Aires, and there's telephonic communication between the Cape and Punta Arenas. Do you imagine that the plane wasn't seen when it came in the Cape? And do you imagine The Master doesn't know we're here?"

Bell turned, then, and frowned blackly.

"I hadn't thought of it," he said grimly, "but I put some hand grenades in the locker, there."

"You damned fool!" said Jamison angrily. "Stop being bloodthirsty and use your head! You haven't even asked what I've done! I've done something, anyhow. That bundle I chucked in the bow has a couple of

sheepmen's outfits in it. Lots of sheep raised around here. We'll put 'em on before we land. And like a good general, I arranged a method of retreat before we left B. A. There'll be a naval vessel here in two or three days. She's carrying a party of Government scientists. She'll anchor in Punta Arenas harbor and announce a case of some infectious disease on board. No shore leave, you see, and nobody from shore permitted on board her. And she has one or two damned good analytical chemists with a damned good laboratory on board her, too. It's a long gamble, but if we can get hold of some of The Master's poison.... Do you see?"

"Yes," said Bell heavily. "I see. But you haven't been through what I've been through. What I've done, fighting that devil, has caused men to be deserted after being enslaved. There's one place, Cuyaba...."

His face twitched. That place was in his dreams, now. That place and others where human beings had watched their bodies go mad, and had been carried about screaming with horror at the crimes those bodies committed....

"I'm going to kill The Master," he rasped. "That's all."

He settled down to his grim watch for the city. All during the cloudy, overcast day he strained his eyes ahead. Jamison could make nothing of him. In the end he had to leave Bell to his moody waiting.

The morning passed, and midday, and a long afternoon. Three times Bell came restlessly back to the engine and tried to coax more speed out of it. But when darkness fell the town was still not in sight. They kept on, then, steering by the stars with the motor putt-putt-putting sturdily away in the stern. The water splashed and washed all about them. The little boat rose, and fell, and rose and fell again.

"That's the town," said Bell grimly.

It was eleven at night, or later. Lights began to appear, very far away, dancing miragelike on the edge of the water. They grew nearer with almost infinite slowness. Two wide bands of many lights, with a darker space in which a few much brighter lights showed clearly. Presently a single red light appeared,

the Punta Arenas harbor light, twenty-five feet up on an iron pole. They passed it.

"Bell," said Jamison curtly, "it's time you showed some sense, now. We're going to find out some things before we get reckless. This town isn't a big one, but it always was a hell on earth. No extradition from here. It's full of wanted men. It's dying, now, from the old days when all ships passed the Straits before the Panama Canal opened up, but it ought to be still a hell on earth. And we're going to put on these sheepmen outfits, and put up at some low caste sailors' and sheepmen's hotel on shore, and find out what is what. In the morning, if you like—"

"In the morning," said Bell coldly, "I'm going to settle with The Master."

They found a small and filthy hotel, in a still filthier street where the houses were alternately black and silent and empty, and filled with the squalid hilarity most seaport towns can somehow manage to support. The street lamps were white and cold. The dirt and squalor showed the more plainly by their light. There

were sailors from the few ships in harbor, and women so haggard and bedraggled that shrill laughter and lavish endearments remained their only allure. And Bell and Jamison plodded to the reeking place in which a half-drunk sheepman pointed, and there Bell sat grimly in the vermin infested room while Jamison, swearing wryly, went out.

He came back later, much later. His breath was strong of bad whiskey and he looked like a man who feels that a bath would be very desirable. He looked like a man who feels unclean.

"Give me a cigarette," he said shortly. "I found out most of what we want to know."

Bell gave him a cigarette and waited.

"Good thing you stayed behind," said Jamison. "I want to vomit. Why people go in hell holes for fun.... But I was very drunk and very amorous. Picked up a woman and fed her liquor. Young, too. Damnation! She got crying drunk and told me everything she knew. I gave her money and left. Punta Arenas is The

Master's, body and soul."

"One could have guessed it," said Bell grimly.

"Nothing like it is," said Jamison. "Every living creature, man, woman, and child, has been fed that devilish poison of his. The keepers of the dives go fawning to the local officials for the antidote. The *jefe politico* is driven in his carriage to be cured when red spots form before his eyes. The damned place is full of suicides, and women, and—oh, my God! It's horrible!"

A humming, buzzing noise set up off in the night somewhere. It kept up for a long time, throttled down. Suddenly it seemed to grow louder, changed in pitch, and dwindled as if into the far, far distance.

"That's one of The Master's planes now, no doubt," said Jamison savagely, "going off on some errand for him. He uses this place practically as an experiment station. The human beings here are his guinea pigs. The deputies get a standardized form of the stuff, but he's got it worked out in different doses so he can

make a man go mad in hours, if he chooses, instead of after a delay. I don't know how. And The Master—"

He checked himself sharply. There were shuffling footsteps in the hall outside. A timid tap on the door. Jamison opened it, while Bell dropped one hand inconspicuously to a weapon inside his shapeless clothing.

The toothless and filthy old man who kept the hotel beamed in at them.

"*Senores*," he cackled. "*Vdes son de Porvenir, no es verdad?*"

Jamison hiccupped, as one who has been out and been drunken ought to do.

"*No, viejo*," he rumbled tipsily, "*somos de la estancia del Señor Rubio. Vaya.*"

The old man seemed to mourn that they did not come from the sheep ranches about Porvenir Bay. But he produced a bottle with a shaking hand, still beaming.

"*Tengo muchos amigos en Porvenir,*" he chirped amiably. "*Y questa botella—*"

"*Démela,*" rumbled Jamison. He reached out his hand.

"*No mas que poquito!*" said the old man, beaming but anxious as Jamison tilted it to his lips. "*Es visky de gentes....*"

He beamed upon Bell, and Bell swallowed a spoonful and seemed to swallow vastly more. He lay back lazily while Jamison in the part of a tipsy shepherd bullied the old man amiably and eventually chased him out.

"You're amused?" asked Jamison sardonically, when there were no more sounds outside. "Because I said you didn't want to meet the young senorita who loved you when she saw you downstairs? Well, Bell, if you used your brain you didn't swallow any of that stuff."

Bell started up. Jamison caught him by the shoulder.

"I'm not sure," he said sharply. "Of course not. But it's

damned funny for a Spanish hotel keeper to give something for nothing, even when he seemed just to want to gossip about his friends. Here. Drink this water. It looks vile enough to take the place of mustard...."

Next morning the hotel keeper beamed upon them both as they went out of the place. A slatternly, dark haired girl who leaned on his shoulder smiled invitingly at Bell. And Bell, in his character of a loutish sheepman from one of the ranches that dot the shores of the Strait, grinned awkwardly back. But he went on with Jamison.

"We separate," said Jamison under his breath. "We want to find where The Master lives, mostly, and then we want to find the laboratory where his stuff is mixed. We don't want to do any killing until that's settled. After all, the Trade has something to say!"

Bell coddled indifferently and began to wander idly about the streets, turning here and there as if moved by nothing more than the vaguest curiosity. But gradually he was working through the sections in

which the larger buildings stood. Concrete structures, astonishingly modern, dotted the business section. But none of them had the air that would surround a place where a man with power of life or death would be. In a town the size of Punta Arenas there would be unmistakable evidences about The Master's residence, even if it were only that those who passed it did so hurriedly and with a twinge of fear.

There were prosperous men in plenty on the streets, mingled with deserting sailors, stockmen and farmers from the villages along the Strait, and even a few grimy men who looked like miners. But there is a lignite mine not far from the city, and a narrow gauge railroad running to it. Of the prosperous-seeming men, however, Bell picked out one here and there toward whom all passersby adopted a manner of cringing respect. Bell lounged against a pole and studied them thoughtfully. Men with an air of amused and careless scorn which only men with unlimited power may adopt. He saw one grossly fat man with hard and cruel eyes. The uniformed policemen drove all traffic abjectly out of the way of his carriage, and

stood with lifted hat until he had passed. The fat man gave no faintest sign of acknowledgment.

"I wonder," said Bell slowly, and very grimly, "if that's The Master?"

And then a passerby dodged quickly past his shoulder, brushing against him, and waited humbly in the street. Bell turned. A party of men were taking up nearly all the sidewalk. There were half a dozen of them in all. And nearly in the middle was the bulky, immaculate, pigmented Ribiera.

Bell stiffened. But to move, beyond clearing the way, would be to attract attention. He backed clumsily off the curbing as if making way....

And Ribiera looked at his face.

Bell's hand drifted near his hidden weapon. But Ribiera looked neither surprised nor alarmed. He halted and chuckled.

"Ah, the Senhor Bell!"

Bell said nothing, looking as stupid as possible, merely because there was nothing else to do.

"Ah, do not deny my acquaintance!" said Ribiera. He laughed. "I advise you to go and look at the view, over the harbor. Good day, Senhor Bell."

Laughing, he went off along the street. And Bell felt a cold horror creeping over him as he realized what Ribiera might mean. Ribiera had entirely too much against him to greet him only, in a town where even the dogs dared not bark without The Master's express command. He had guards with him, men who would have shot Bell down at a nod from Ribiera.

Bell burst into a mad run for the waterfront. When the bay spread out before his eyes he saw what Ribiera meant, and something seemed to snap in his brain.

The plane in which he and Jamison and Paula had escaped in was floating out in the harbor. It was unmistakable. A larger, bulkier seaplane floated beside it. The buzzing in the air the night before....

The arrival of the plane had been telephoned from Cape Virgins. Through a glass, perhaps, even its alighting had been watched. And a big seaplane had gone out to bring it back. Footprints in the sand would lead toward the lighthouse. There would be plenty of men to storm that, if necessary, to take the three fugitives. But they would have found only Paula. It was quite possible that the plane had only been sent for after Bell and Jamison had been seen to land in Punta Arenas. And Paula in The Master's hands would explain Ribiera's amusement perfectly.

Bell found Jamison looking unhurriedly for him. And Jamison glanced at his utterly white face and said softly:

"We want to get where we can't be seen, to talk. There's the devil to pay."

"No use hiding," said Bell. His lips seemed stiff.

"Paula—"

"Hide anyway," snapped Jamison. He fairly thrust Bell into an alleyway between two houses and thrust two

rounded objects beneath his loose fitting coat. "Two grenades. I have two more. The boat we came in is taken—"

"So is the plane," said Bell emotionlessly.

"And there is a sign, in English, posted where we tied it up. The sign says, '*The Senores Bell and Jamison may recover their boat on application to The Master, and may also receive news of a late traveling companion from him.*'"

"We're known," Bell told him—and amazingly found it possible to smile faintly—"Ribiera met me on the street and spoke to me and laughed and went on."

Jamison stared. Bell's manner was almost entirely normal again. Then Jamison shrugged.

"The sense of what you're saying," he observed wryly, "is that we're licked. Let us, then, go to see The Master. I confess I feel some curiosity to know just what he's like."

Bell was smiling. Being in an entirely abnormal state, he had a curious certitude of the proper course to adopt. He went up to a policeman and said politely, in Spanish:

"I am desired to report to The Master, himself. Will you direct me?"

The policeman abased himself instantly and trotted with them as a guide. And Bell walked naturally, now, with his head up and his shoulders back, and smoked leisurely as he went, and the policeman's abasement became abject. All who walked with that air of amused superiority in Punta Arenas were high in the service of The Master. Obviously, the two men in these dejected clothes must also be high in the service of The Master, and had adopted their disguise for purposes into which a mere policeman and a slave of The Master should not dare enquire.

Jamison was rather grim and still. Jamison thought he was walking to his death. But Bell smiled peculiarly and talked almost gaily and—as Jamison thought—almost irrationally.

They came to a house set in a fairly spacious lawn behind a rather high wall. There were greenhouses behind it, and there were flowers growing as well as any flowers can be expected to grow in such high altitudes. It was an extraordinarily cheerful dwelling to be found in Punta Arenas, but the shuddering fear with which the little policeman removed his hat as he entered the gateway was instructive.

They were confronted by four other policemen, on guard inside the gate.

"*Estos Señores*—" began the abject one.

"Take us to The Master," commanded Bell in a species of amused and superior scorn.

"It is required, Senor," said the leader of the four on guard, very respectfully, "it is required that none enter without being searched for weapons."

Bell laughed.

"Does The Master manage things so?" he asked

scornfully. "Now, where I am deputy no man would dare to think of a weapon to be used against me! If it is The Master's rule, though...."

The policeman cringed. Bell scornfully thrust an automatic out.

"Take it," he snapped. "And go and tell The Master that the Senores Bell and Jamison await his pleasure, and that they have given up their weapons."

The policeman scuttled toward the house. Bell smiled at his cigarette.

"Do you know, Bell," said Jamison dryly, in English, "I'd hate to play poker with you."

"I'm not bluffing," said Bell. "Not altogether. I've a four card flush, with the draw to come."

Almost instantly the policeman returned, more abject still. He had stammered out Bell's message, just as it was given him. And the slaves of The Master did not usually disobey orders, especially orders designed to

prevent any danger of a doomed man or woman trying to assassinate The Master before madness was complete. Bell and Jamison were received by liveried servants in utter silence and conducted through a long passageway, too long to have been contained entirely in the house as seen from the front. Indeed, they came out into a great open greenhouse, in which the smell of flowers was heavy. There were flowers everywhere, and a benign, small old man with a snowy beard and hair, sat at a desk as if chatting of amiable trivialities with the frock-coated men who stood about him. The white haired old man lifted a blossom delicately to his nostrils and inhaled its perfume with a sensitive delight. He looked up and smiled benignly upon the two.

It was then that Jamison got a shock surpassing all the rest. Bell's hands were writhing at the ends of his wrists, writhing as if they were utterly beyond his control and as if they were longing to rend and tear....

And Bell suddenly looked down at them, and his expression was that of a man who sees cobras at the ends of his arms.

Chapter 17

There was a long pause. Bell was very calm. He seemed to tear his eyes from the writhing hands that were peculiarly sensate, as if under the control of an intelligence alien to his own.

"I believe," said Bell steadily, "that The Master wishes to speak to me."

With an apparent tremendous effort of will, he thrust his hands into his pockets. Jamison cursed softly. Bell had taken the direction of things entirely out of his hands. It only remained to play up.

"To be sure," said a mild, benevolent voice. The man with the snowy beard regarded Bell exactly in the fashion of an elderly philanthropist. "I am The Master, Senor Bell. You have interested me greatly. I have grown to have a great admiration for you. Will you be seated? Your companion also pleases me. I would like"—and the mild brown eyes beamed at him—"I would like to have your friendship, Senor Bell."

"Pull out a chair for me, Jamison," said Bell in a strained voice. "And—I'd like to have a cigarette."

Jamison, cursing under his breath, put a chair behind Bell and stuck a cigarette between his lips. He held a match, though his hands shook.

"You might sit down, too," said Bell steadily. "From the manner of The Master, I imagine that the conversation will take some time."

He inhaled deeply of his cigarette, and faced the little man again. And The Master looked so benevolent that he seemed absolutely cherubic, and there was absolutely no sign of anything but the utmost saintliness about him. His eyes were clear and mild. His complexion was fresh and translucent. The wrinkles that showed upon his face were those of an amiable and a serene soul filled with benevolence and charity. He looked like one of those irritatingly optimistic old gentlemen who habitually carry small coins and stray bits of candy in their pockets for such small children as they may converse with under the smiling eyes of nurses.

"Ah, Senor Bell," he said gently. "You do cause me to admire you. May I see your hands again?"

Bell held them out. He seemed to have conquered their writhing to some extent. But he could not hold them quite still. Sweat stood out on his forehead. He thrust them abruptly out of sight again.

"Sad," said The Master gently. "Very sad." He sighed faintly and laid down the rose he had been toying with. His fingers caressed the soft petals delicately. "Fortunately," he said benevolently, "it is not yet too late for me to relieve the strain under which you labor, Senor. May I send for a certain medicine which will dispose of those symptoms in a very short time?"

"We'll talk first," said Bell harshly. "I want to hear what you have to say."

The Master nodded, his fingers touching the rose petals as if in a sensitive pleasure in their texture.

"Always courageous," he said benignly. "I admire it while I combat it. But the Senor Jamison...."

Jamison had been looking fascinatedly at his own hands, opening and closing the fingers with a savage abruptness. They obeyed him, though they trembled.

"I didn't drink the damned stuff that hotel keeper brought us last night," he growled. "Bell did. And I—"

"Wait a minute, Jamison," said Bell evenly. "Let's talk to The Master for a while. I swore, sir," he said grimly, "that I'd kill you. I've seen what your devilish poison does, in the hands of the men you've chosen to distribute it. I've seen"—he swallowed and said harshly—"I've seen enough to make me desire nothing so much as to see you roast in hell! But you wanted to talk to me. Go ahead!"

The Master beamed at him, and then glanced about at the frock-coated men who had been attending him. Bell glanced at them. Ribiera was there, chuckling.

"I told you, *tio mio*," he said familiarly, "that he would not be polite. You can do nothing with him. Better have him shot."

Francia, of Paraguay, nodded amusedly to Bell as their eyes met. But The Master shook his really rather beautiful head. An old man can be good to look at, and with a saintly aureole of snow-white hair and the patriarchal white beard, The Master was the picture of benign and beautiful old age.

"Ah, you do not understand," he protested mildly. "The more the Senor Bell shows his courage, *hijo mio*, the more we must persuade him." He turned to Bell. "I realise," he said gently, "that there are hardships connected with the administration of my power, Senor. It is inevitable. But the Latin races of the continent which is now nearly mine require strong handling. They require a strong man to lead them. They are comfortable only under despotism. The task I have chosen for you is different, entirely. *Los Americanos del Norte* will not respond to the treatment which is necessary for those *del Sud*. Their governments, their traditions, are entirely unlike. If you become my deputy and viceroy for all your nation, you shall rule as you will. A benevolent, yet strong, rule is needed for your people. It may even be—I will

permit it—that the democratic institutions of your nation may continue if you so desire. I am offering you, Senor, the position of the absolute ruler of your nation. You may interfere with the present government not at all, if you choose, provided only that my own commands are obeyed when relayed through you. I choose you because you have courage, and resource, and because you have the *Yanqui* cleverness which will understand your nation and cope with it."

Bell inhaled deeply.

"In other words," he said bitterly, "you're saying indirectly that you offer me a chance to be the sort of ruler Americans will submit to without too much fuss, because you think one of Ribiera's stamp would drive them to rebellion."

The fine dark eyes twinkled.

"You have much virtue, Senor. My nephew—though he is to be my successor—has a weakness for a pretty face. Would you prefer that I give him the task of

subduing your nation?"

"You might try it," said Bell. His eyes gleamed. "He'd be dead within a week."

The Master laughed softly.

"I like you, *Senor*. I do like you indeed. I have not been so defied since another *Americano del Norte* defied me in this same room. But he had not your resource. He had been enslaved with much less difficulty than yourself. I do not remember what happened to him...."

"He was taken, Master," said a fat man with hard eyes, obsequiously, "he was taken in Bolivia." It was the man whom Bell had seen earlier that morning in a carriage. "You gave him to me. He had insulted me when I ordered him sent to you. I had him killed, but he was very obstinate."

"Ah, yes," said The Master meditatively. "You told me the details." He seemed to recall small facts in benevolent retrospection. "But you, *Senor Bell*, I have

need of you. In fact, I shall insist upon your friendship. And therefore—"

He beamed upon Bell.

"I give you back the Senorita Canalejas."

He shook his head reproachfully at the utterly grim look in Bell's eyes.

"I shall give you one single portion of the antidote to the medicine which makes your hands behave so badly. You may take it when you please. The Senor Jamison I shall keep and enslave. I do not think he will be as obstinate as you are, but he has excellent qualities. If you prove obdurate, I may yet persuade him to undertake certain tasks for me. But you and the Senorita Canalejas are free. Your boat has been reprovisioned and provided with fuel. You may go from here where you will."

Ribiera snarled.

"*Tio mio*," he protested angrily, "you promised me—"

"Your will in many things," said The Master gently, "but not in all. Remember that you have much to learn, *hijo mio*. I have taught you to prepare my little medicine, it is true. That is so you can take my place if age infirmity shall carry me away." The Master folded his hands with an air of pious resignation. "But you must learn policy. The Senorita Canalejas belongs to the Senor Bell."

Jamison was staring, now, but Bell's eyes had narrowed to mere slits.

"You see," said The Master gently, to him, "I desire your friendship. You may go where you will. You may take the Senorita Canalejas with you. You will have enough of the antidote to my little medicine to keep you sane for perhaps a week. In one week you may go far, with her. You may do many things. But you cannot find a place of safety for her. I still have a little power, Senor. If you take her with you, your hands will writhe again. Your body will become uncontrollable. Your eyes, staring and horror-struck, will observe your own hands rending her. While your brain is yet sane you will see this body of yours which now desires her so

ardently, tearing at and crushing that delicate figure, gouging out her eyes, battering her tender flesh, destroying her.... Have you ever seen what a man who has taken my little medicine does to a human being at his mercy?"

The figures about The Master were peculiarly tense. The fat man with the hard eyes laughed suddenly. It was a horrible laugh. Francia of Paraguay took out his handkerchief and delicately wiped his lips. He was smiling. Ribiera looked at Bell's face and chuckled. His whole gross figure shook with his amusement.

"And of course," said The Master benignly, "if you prefer to commit suicide, if you prefer to leave her here—well, my nephew knows little expedients to reduce her will to compliance. You recall *Yagué*, among others."

Bell's face was a white mask of horror and fury. He tried to speak, and failed. He raised his hand to his throat—and it tore at the flesh, insanely.

"Let—let me see her," croaked Bell, as if strangling.

Jamison stiffened. Bell seemed to be trying to get his hands into his pockets. They were apparently uncontrollable. He thrust them under his coat as there was a stirring at the door.

And Paula was brought in, as if she had been waiting. She was entirely colorless, but she smiled at Bell. She came quickly to his side.

"I heard," she said in a clear and even little voice. "We will go together, Charles. If there is a week in which we can be together, it will be so much of happiness. And when you are—The Master's victim, we will let the little boat sink, and sink with it. I do not wish to live without you, Charles, and you do not wish to live as his slave."

Bell gave utterance to a sudden laugh that was like a bark. His hands came out from under his coat. Dangling from each one was a small, pear-shaped globule of metal. A staff projected upward from each one, and he held those staffs in his writhing hands. About each wrist was a tiny loop of cord that went down to a pin at the base of the staffs.

"Close to me, Paula," he said coldly. She clung to his arm. He moved forward, with half-a-dozen revolver muzzles pointed at his breast.

"If one of you damned fools fires," he said harshly, "I'll let go. When I let go—these are Mills grenades, and they go off in three seconds after they leave the hand. Stand still!"

There was a terrible, frozen silence. Then a movement from behind Bell. Jamison was rising with a grunt.

"Some day, Bell," he observed coolly, "I'll be on to all of your curves. This is the best one yet. But you're likely to let go at any second, aren't you?"

"Like hell!" raged Bell. "I drank some of your poison," he snarled at The Master. "Yes! I was fool enough to do it! But I took what measures any man will take who finds he's swallowed poison. I got it out of my stomach at once. And if you or one of these deputies tries to move...."

Ribiera had blanched to a pasty gray. The Master was frozen. But Bell saw Ribiera's eyes move in swift calculation. There was a solid wall behind The Master. It seemed as if the greenhouse were a sort of passageway between two larger structures. And there was a door almost immediately behind Ribiera. Ribiera glanced right—left—

He flung himself through that door. He knew the secret of The Master's power. He was The Master's appointed successor. If The Master and all his deputies died, Ribiera....

But Bell snapped into action like a bent spring released. His arm shot forward. A grenade went hurtling through the door through which Ribiera had fled. There was an instantaneous, terrific explosion. The solid wall shook and shivered and, with a vast deliberation, collapsed. The greenhouse was full of crushed plaster dust. Panes of glass shivered....

But Bell was upon The Master. He had struck the little man down and stood over him, his remaining automatic replacing the grenade he had thrown.

"Ribiera's dead," he snapped, "and if I'm shot The Master dies too and you all go mad! Stand back!"

The deputies stood frozen.

"I think," said Jamison composedly, "I take a hand now. I'll pick him up, Bell.... Right. I've got him. With a grenade hanging down his back. If he jerks away from me, or I from him, it will blow his spine to bits."

"Hold him so," said Bell coldly.

He went coolly to where he could look over the heap of the collapsed wall. He saw a bundle of torn clothing that had been a man. It was flung against a cracked and tottering chimney.

"Right," he said evenly. "Ribiera's dead, all right."

He turned to the deputies, whose revolvers were still in their hands.

"The Master's carriage, please," he said politely. "To the door. You may accompany us if you please, but in

other carriages. I am working for the release of all the Master's slaves, and you among them if you choose. But you can see very easily that there is no hope of the release of The Master without the meeting of my terms."

The Master spoke, softly and mildly and without fear.

"It is my order that the Senor Bell is to be obeyed. I shall return. You need have no fear of my death. My carriage."

A man went stiffly, half-paralyzed with terror, to where chattering scared servants were grouped in the awful fear that came upon the slaves of The Master at any threat to his rule.

But Bell and Paula and Jamison went slowly and cautiously—though they held the whip hand—to the entrance door of the house, and out to the entrance gate. A carriage was already before the door when they reached it, and others were drawing up in a line behind it.

"Get in," said Bell briefly. "Down to the waterfront."

He turned to the group of frock-coated, stricken men who had followed.

"Some of you men," he said coldly, "had better go on ahead and warn the police and the public generally about the certainty of The Master's death if any attempt is made to rescue him."

Francia, of Paraguay, summoned a swagger and raised his hand to the second carriage. It drew in to the curb.

"I will attend to it, Senor Bell," he said politely. "Ah, when I think that I once raised my revolver to shoot you and refrained!"

He drove off swiftly.

Bell's eyes were glowing. He got into the carriage, and such a procession drove through the streets of Punta Arenas as has rarely moved through the streets of any city in the world. The long line of carriages

moved at a funereal pace amid a surging, terrified mob. The Master beamed placidly as he looked out over white, starkly agonized faces. Some of the people groaned audibly. A few cursed The Master in their despair. More cursed Bell, not daring to strike or fire on him. But he would have been torn to bits if he had stepped from the carriage for an instant.

"Bell," said Jamison dryly, "considering that I'm prepared to be blown apart on three seconds notice, it is peculiar that this mob frightens me."

The Master's eyes twinkled benignly. He seemed totally insensible to fear.

"You need not be afraid," he said gently. "They will not touch you unless I order them."

Jamison stared down at the little man whose collar he held firmly, with a Mills grenade dangling down at the base of his neck.

"I wouldn't order them to attack, if I were you," he said coldly. "I haven't Bell's brains, but I have just as

much dislike for you as he has."

They came to the harbor. Bell spoke again.

"The carriage is to drive out to the end of one of the docks, and no one else is to go out on that dock."

The Master relayed the order in his mild voice, but as the coachman obeyed him he clucked his tongue commiseratingly.

"Senor Bell," he protested gently. "You do not expect to escape! Not after killing me! Why that is absurd!"

Bell said nothing. He alighted from the carriage, his face set grimly, and stared ashore at the long, long row of terrified faces staring out at him. The whole waterfront seemed to be lined with staring faces. Wails came from that mass of enslaved human beings.

"Hold him here, Jamison," he said drearily. "I'm going out to look at that big plane. There's a rowboat tied to the dock, here."

He swung down the side into the dock and rowed off into the harbor, while the horses attached to The Master's carriage pawed impatiently at the wooden flooring of the dock. Bell reached the two planes anchored on the still harbor water. The smaller one had brought them down from Buenos Aires. The larger one had gone after the beached amphibian and brought it and Paula on to the city. Bell, from the shore, was seen to be investigating the larger one. He came rowing back.

His head appeared above the dock edge.

"All right," he said tiredly. "The Master has a rule requiring all his ships ready for instant flight. Very useful. The big plane is fueled and full of oil. We'll go out to it and take off."

Jamison lifted The Master to his feet and with a surge of muscles swept him down to the flooring of the dock.

"Paula first," said Bell, "and then The Master, and then you, Jamison."

"One moment," said The Master reproachfully. "It would be cruel not to let me reassure my subjects. I will give an order."

Bell and Jamison listened suspiciously. But he spoke gently to the coachman.

"You will tell the deputies," said The Master in Spanish, "that a month's supply of medicine for all my subjects will be found in my laboratory. And you may tell them that I shall return before the end of that time."

The coachman's eyes filled with a passionate relief.

"Now," said The Master placidly, "I am ready for our little jaunt."

Paula descended the ladder and seated herself in the bow of the boat. Bell covered The Master grimly with his automatic as he descended, with surprising agility. Jamison came down last, and resumed his former grip on The Master's collar. Bell rowed out to the big plane.

Jamison kept close watch while Bell started the four huge motors and throttled them down to warming up speed, and while he hauled up the anchor with which the huge seaplane was anchored.

The dock was covered with a swarm of panic stricken folk.

[Image description start: A black and white illustration showing a crowd of horrified people looking at something offscreen. Image description

end.]

Everywhere, all the inhabitants of the city who were slaves to The Master had come in awful terror to watch. And all the inhabitants of the city were slaves to The Master. Some of them fell to their knees and held out imploring arms to Bell, begging him for mercy and the return of The Master. Some cursed wildly.

But, with his jaws set grimly, Bell gave the motors the gun.

The big plane moved heavily, then more swiftly through the water. It lifted slowly, and rose, and rose, and dwindled to a speck high in the air.

And all through the streets and ways of Punta Arenas, fear stalked almost as a tangible thing. Panic hovered over the housetops, always ready to descend. Terror was in the air that every man breathed, and every human being looked at every other human being with staring, haunted eyes. Punta Arenas was waiting for its murder madness to begin.

Chapter 18

There were four motors to pull the big plane through the air, and their roaring was a vast thundering noise which the earth re-echoed. But inside the cabin that tumult was reduced to a not intolerable humming sound.

"What'll I do with this devil, Bell?" asked Jamison.

"Now that we're aloft, I confess this grenade makes me nervous. I'm holding it so tightly my fingers are getting cramped."

"Tie him up," said Bell, without looking. "He'll talk presently."

Movements. The plane flew on, swaying slightly in the way of big sea-planes everywhere. A williwaw began in the hills ahead and swept out and set the ship to reeling crazily in its erratic currents. The Strait vanished and there were tumbled hills below them. Minutes passed.

"Got him fixed up," said Jamison coolly, "I'll guarantee

he won't break loose. Got any plans, Bell?"

"No time," said Bell. "I haven't had time to make any. The first thing is to get where his folk will never find us. Then we'll see what we can do with him."

Paula looked at the now bound figure of The Master. And the little old man beamed at her.

"He—he's smiling!" said Paula, in a voice that was full of a peculiar horrified shock.

Bell shrugged. Punta Arenas was all of twenty-five miles behind, and the earth over which they flew began to take on the shape of an island. Water appeared beyond it, and innumerable small islands. Bell began to rack his brain for the infinitesimal scraps of knowledge he had about this section of the world. It was pitifully scanty. Punta Arenas was the southernmost point of the continental mass. All about it was an archipelago and a maze of waterways, thinly inhabited everywhere and largely without any inhabitants at all. The only solid ground between Cape Horn and the Antarctic ice pack was Diego

Ramirez and the South Shetlands....

Nothing to go on. But any sufficiently isolated and desolate spot would do. Almost anywhere along the southern edge of the continental islands should serve.

The plane roared on monotonously, while Bell began to wrestle with another and more serious problem. In three days—two, now—an American naval vessel would turn up, with scientists and chemists on board. It was to be doubted whether anything like an overt act would be risked by that vessel. If all the governments of South America were under The Master's thumb, then cabled orders from his deputies would race three navies to the spot. And the government of the United States does not like to start war, anywhere. Certainly it would not willingly enter into a conflict with the whole southern continent for the solution of a problem that so far affected that continent alone. The Master's kidnapping had solved nothing, so far.

Jamison tapped his shoulder.

"No pursuit, so far," he observed coolly. "I've looked."
Bell nodded.

"They don't dare. Not yet, anyhow. They're depending on The Master. How is he?"

"Smiling peacefully to himself, damn him!" snarled Jamison. "Do you know what we're up against?"

"Ourselves," said Bell coldly. "But I'm nearly licked. He's got to talk!"

Jamison moved away again. The earth below looked as if it had been torn to shreds in some titanic convulsion of ages past. The sea was everywhere, and so was land! There were little threads of silver interlacing and crossing and wavering erratically in every conceivable direction. And there were specks of islands—rocks only yards in extent—and islands of every imaginable size and shape, with their surfaces in every possible state of upheaval and distortion. A broader mass of land appeared ahead and to the left.

"Tierra del Fuego again," muttered Bell. "If we cross

it...."

For fifteen minutes the plane thundered across desolate, rocky hills. Then the maze of islets again. Bell scanned them keenly, and saw a tiny steamer traveling smokily, for no conceivable reason, among the scattered bits of stone. The sea appeared, stretching out toward infinity.

Bell rose, to survey a wider space. He swung to the left, so that he was heading nearly southeast, and went on down toward that desolation of desolations, the stormy cape which faces the eternal ice of the antarctic. He was five thousand feet up, then, and scanning sea and earth and sky....

And suddenly he swung sharply to the right and headed out toward the open sea. He felt a small figure pressing against his shoulder. Presently fingers closed tightly upon his sleeve. He glanced down at Paula and managed to smile.

"There are some rocks out there," he told her quietly. "Islands, I think, and Diego Ramirez, at a guess."

They were specks, no more, but they were vastly more distinct from the plane than from Mount Beaufoy. That is on Henderson Island in New Year Sound, and its seventeen-hundred-foot peak was almost below Bell when he sighted the islands. But the islands have been seen full fifty miles from there.

It took the plane nearly forty minutes to cover the space, but long before that the islands had become distinct. Two tiny groups of scattered rocks, the whole group hardly five miles in length and by far the greater number no more than boulders surrounded by sheets of foam from breakers. Two of them merited the name of islands. The nearer was high and bare and precipitous. No trace of vegetation showed upon it. The farther was smaller, and at its northern corner a little cove showed, nearly land-locked.

Bell descended steeply. The big plane plunged wildly in the air eddies about the taller island at five hundred feet, but steadied and went winging on down lower, and lower.... The waves between the two islands were not high, but the seaplane alighted with a mighty, a tremendous splashing, and Bell navigated

it grimly though clumsily into the mouth of the cove. There a small beach showed. He went very slowly toward it. Presently he swung abruptly about. A wing tip float grounded close to the shore.

The motors cut off and left a thunderous silence. Bell climbed atop the cabin and let go the anchor.

"We're here," he said shortly. "Bring The Master and we'll go ashore."

The catwalk painted on the lower wing guided them. Bell jumped to the rocks first, and stumbled, and then rose to lift Paula down and take The Master's small, frail body from Jamison's arms.

"You looked for a gun?" asked Bell

"He'd nothing to fight with," said Jamison heavily. He had been facing the same problem Bell had worked on desperately, and had found no answer. But he shuddered a little as he looked about the island.

There was nothing in sight but rock. No moss. No

lichens. Not even stringy grass or the tufty scrub bushes that seemed able to grow anywhere.

Bell untied The Master, carefully but without solicitude. The little man sat up, and brushed himself off carefully, and arranged himself in a comfortable position.

"I am an old man," said The Master in mild reproach. "You might at least have given me a cushion to sit upon."

Bell sat down and lighted a cigarette with fingers that did not tremble in the least.

"Suppose," he said hardly, "you talk. First, of what your poison is made. Second, of what the antidote is made. Third, how we may be sure you tell the truth."

The Master looked at him with bright, shrewd, and apparently kindly old eyes.

"*Hijo mio*," he said mildly, "I am an old man. But I am obstinate. I will tell you nothing."

Bell's eyes glowed coldly.

"Does it occur to you," he asked grimly, "that it's too important a matter for us to have any scruples about? That we can—and will—make you talk?"

"You may kill me," said The Master benignly, "but that is all."

"And," said Bell, still more grimly, "we have only to get back in the plane yonder, and go away...."

The Master beamed at him. Presently he began to laugh softly.

"*Hijo mio*," he said gently, "let us stop this little byplay. You will take me back in my airplane, and you will land me at Punta Arenas. And then you will fly away. I concede you freedom, but that is all. You cannot leave me here."

"Paula," said Bell coldly, "get in the plane again. Jamison—"

Paula rose doubtfully. Jamison stood up. The Master continued to chuckle amiably.

"You see," he said cherubically, "you happen to be a gentleman, Senor Bell. Every man has some weakness. That is yours. And you will not leave me here to die, because you have killed my nephew, who was the only other man who knew how to prepare my little medicine. And you know, Senor, that all my subjects will wish to die. Those who do, in fact," he added mildly, "will be fortunate. The effect of my little medicine does not make for happiness without its antidote."

Bell's hands clenched.

"You know," said The Master comfortably, "that there are many thousands of people whose hands will writhe, very soon. The city of Punta Arenas will be turned into a snarling place of maniacs within a very little while—if I do not return. Would you like, Senor, to think in after days of that pleasant city filled with men and women tearing each other like beasts? Of little children, even, crouching, and crushing and

rending the tender flesh of other little children? Of
lissing little ones gone—"

"Stop!" snarled Bell, in a frenzy. "Damn your soul!
You're right! I can't! You win—so far!"

"Always," said The Master benevolently. "I win
always. And you forget, Senor. You have seen the
worst side of my rule. The revolutions, the rebellions
that have made men free, were they pretty things to
watch? Always, *amigo*, the worst comes. But when my
rule is secure, then you shall see."

He waved a soft, beautifully formed hand. From every
possible aspect the situation was a contradiction of all
reason. The bare, black, salt encrusted rocks with no
trace of vegetation showing. The gray water rumbling
and surging among the uneven rocks at the base of
the shore, while gulls screamed hoarsely overhead.
The white haired little man with his benevolent face,
smiling confidently at the two grim men.

"The time will come," said The Master gently, and in
the tone of utter confidence with which one states an

inescapable fact, "the time will come when all the earth will know my rule. The taking of my little medicine will be as commonplace a thing as the smoking of tobacco, which I abhor, Senores. You are mistaken about there being an antidote and a poison. It is one medicine only. One little compound. A vegetable substance, Senor Bell, combined with a product of modern chemistry. It is a synthetic drug. Modern chemistry is a magnificent science, and my little medicine is its triumph. Even my deputies have not heard me speak so, Senores."

Bell snarled wordlessly, but if one had noticed his eyes they would have been seen to be curiously cool and alert and waiting. The Master leaned forward, and for once spoke seriously, almost reverently.

"There shall be a forward step, Senores, in the race of men. Do you know the difference between the brain of a man and that of an anthropoid ape? It consists only of a filmy layer of cortex, a film of gray nerve cells which the ape has not. And that little layer creates the difference between ape and man. And I have discovered more. My little medicine acts upon that

film. Administered in the tiny quantities I have given to my slaves, it has no perceptible effect. It is merely a compound of a vegetable substance and a synthetic organic base. It is not excreted from the body. Like lead, it remains always in solution in the blood. But in or out of the blood it changes, always, to the substance which causes murder madness. Fresh or changed, my little medicine acts upon the brain."

He smiled brightly upon them.

"But though in tiny quantities it has but little effect, in larger quantities—when fresh it makes the functioning of the gray cells of the human brain as far superior to the unmedicated gray cells, as those human gray cells are to the white cells of the ape! That is what I have to offer to the human race! Intelligence for every man, which shall be as the genius of the past!"

He laughed softly.

"Think, Senores! Compare the estate of men with the estate of apes! Compare the civilization which will

arise upon the earth when men's brains are as far above their present level as the present level is above the anthropoid! The upward steps of the human race under my rule will parallel, will surpass the advance from the brutish caveman to intellectual genius. But I have seen, Senores, the one danger in my offering."

There was silence. Jamison shook his head despairingly. The Master could not see him. He formed the word with his lips.

"Crazy!"

But Bell said coldly:

"Go on."

"I must rule," said The Master soberly. "It is essential. If my little secret were known, intelligences would be magnified, but under many flags and with many aims. Scientists, with genius beside which Newton's pales, would seek out deadly weapons for war. The world would destroy itself of its own genius. But under my rule—"

"Men go mad," said Bell coldly.

The Master smiled reproachfully.

"Ah, you are trying to make me angry, so that I will betray something! You are clever, Senor Bell. With my little medicine, in such quantities as I would administer it to you...."

"You describe it," said Bell harshly and dogmatically, "as a brain stimulant. But it drives men mad."

"To be sure," said The Master mildly. "It does. It is not excreted from the body save very, very slowly. But it changes in the blood stream. As—let us say—sugar changes into alcohol in digestion. The end-product of my little medicine is a poison which attacks the brain. But the slightest bit of unchanged medicine is an antidote. It is"—he smiled amiably—"it is as if sugar in the body changed to alcohol, and alcohol was a poison, but sugar—unchanged—was an antidote. That is it exactly. You see that I have taken my little medicine for years, and it has not harmed me."

"Which," said Bell—and somehow his manner made utter silence fall so that each word fell separately into a vast stillness—"which, thank God, is the one thing that wins finally, for me!"

He stood up and laughed. Quite a genuine laugh.

"Paula," he said comfortably, "get on the plane. In the cabin. Jamison and I are going to strip The Master."

Paula stared. The Master looked at him blankly. Jamison frowned bewilderedly, but stood up grimly to obey.

"But Senor," said The Master in gentle dignity, "merely to humiliate me—"

"Not for that," said Bell. He laughed again. "But all the time I've been hearing about the stuff, I've noticed that nobody thought of it as a drug. It was a poison. People were poisoned. They did not become addicts. But you—you are the only addict to your drug."

He turned to Jamison, his eyes gleaming.

"Jamison," he said softly, "did you ever know of a drug addict who could bear to think of ever being without a supply of his drug—*right on his person*?"

Jamison literally jumped.

"By God! No!"

The Master was quick. He was swarming up the plane-wing tip before Jamison reached him, and he kicked frenziedly when Jamison plucked him off. But then it was wholly, entirely, utterly horrible that the little white haired man, whose face and manner had seemed so cherubic and so bland, should shriek in so complete a blind panic as they forced his fingers open and took a fountain pen away from him.

"This is it," said Bell in a deep satisfaction. "This is his point of weakness."

The Master was ghastly to look at, now. Jamison held him gently enough, considering everything, but The Master looked at that fountain pen as one might look at Paradise.

"I—I swear," he gasped. "I—swear I will give you the formula!"

"You might lie," said Jamison grimly.

"I swear it!" panted The Master in agony. "It—If the formula is known it—can be duplicated! It—the excretion can be hastened! It can all be forced from the body! Simply! So simply! If only you know! I will tell you how it is done! The medicine is the cacodylate of—"

Bell was leaning forward, now, like a runner breasting the tape at the end of a long and exhausting race.

"I'll trade," he said softly. "Half the contents of the pen for the formula. The other half we'll need for analysis. Half the stuff in the pen for the formula for freeing your slaves!"

The Master sobbed.

"A—a pencil!" he gasped. "I swear—"

Jamison gave him a pencil and a notebook. He wrote, his hands shaking. Jamison read inscrutably.

"It doesn't mean anything to me," he said soberly, "but you can read it. It's legible."

Bell smiled faintly. With steady finger he took his own fountain pen from his pocket. He emptied it of ink, and put a scrupulous half of a milky liquid from The Master's pen into it. He passed it over.

"Your medicine," said Bell quietly, "may taste somewhat of ink, but it will not be poisonous. Now, what do we do with you? I give you your choice. If we take you with us, you will be held very secretly as a prisoner until the truth of the information you have given us can be proven. And if your slaves have all been freed, then I suppose you will be tried...."

The Master was drawn and haggard. He looked very, very old and beaten.

"I—I would prefer," he said dully, "that you did not tell where I am, and that you go away and leave me here.

I—I may have some subjects who will search for me, and—they may discover me here.... But I am beaten, Senor. You know that you have won."

Bell swung up on the wing of the plane. He explored about in the cabin. He came back.

"There are emergency supplies," he said coldly. "We will leave them with you, with such things as may be useful to allow you to hope as long as possible. I do not think you will ever be found here."

"I—prefer it, Senor," said The Master dully. "I—I will catch fish...."

Jamison helped put the packages ashore. The Master shivered. Bell stripped off his coat and put it on top of the heap of packages. The Master did not stir. Bell laid a revolver on top of his coat. He went out to the plane and started the motors. The Master watched apathetically as the big seaplane pulled clumsily out of the little cove. The rumble of the engines became a mighty roar. It started forward with a rush, skimmed the water for two hundred yards or so, and suddenly

lifted clear to go floating away through the air toward the north.

Paula was the only one who looked back.

"He's crying," she said uncomfortably.

"It isn't fear," said Bell quietly. "It's grief at the loss of his ambition. It may not seem so to you two, but I believe he meant all that stuff he told me. He was probably really aiming, in his own way, for an improved world for men to live in."

The plane roared on. Presently Bell said shortly:

"That stuff he has won't last indefinitely. I'm glad I left him that revolver."

Jamison stirred suddenly. He dug down in his pocket and fished out a cigar.

"Since I feel that I may live long enough to finish smoking this," he observed dryly, "I think I'll light it. I haven't felt that I had twenty minutes of life ahead of

me for a long time, now. A sense of economy made me smoke cigarettes. It wouldn't be so much waste if you left half a cigarette behind you when you were killed."

The tight little cabin began to reek of the tobacco. Paula pressed close to Bell.

"But—Charles," she asked hopefully, "is—is it really all right, now?"

"I think so," said Bell, frowning. "Our job's over, anyhow. We go up the Chilean coast and find that navy boat. We turn our stuff over to them. They'll take over the task of seeing that every doctor, everywhere in South America, knows how to get The Master's poison out of the system of anybody who's affected. Some of them won't be reached, but most of them will. I looked at his formula. Standard drugs, all of them. There won't be any trouble getting the news spread. The Master's slaves will nearly go crazy with joy. And," he added grimly, "I'm going to see to it that the Rio police take back what they said about us. I think we'll have enough pull to demand that much!"

He was silent for a moment or so, thinking.

"I do think, Jamison," he said presently, "we did a pretty good job."

Jamison grunted.

"If—if it's really over," said Paula hopefully, "Charles —"

"What?"

"You—will be able to think about me sometimes," asked Paula wistfully, "instead of about The Master always?"

Bell stared down at her.

"Good Lord!" he groaned. "I have been a brute, Paula! But I've been loving you—" He stopped, and then said with the elaborate politeness and something of the customary idiotic air of a man making such an announcement. "I say, Jamison, did you know Paula and I were to be married?"

Jamison snorted. Then he said placidly:

"No. Of course not. I never dreamed of such a thing. When did this remarkably original idea occur to you?"

He puffed a huge cloud of smoke from his cigar. It was an unusually vile cigar. Bell scowled at him helplessly for a moment and then said wrathfully:

"Oh, go to hell!"

And he bent over and kissed Paula.

#27 The Jovian Jest, By Lilith Lorraine:

There came to our pigmy planet a radiant wanderer with a message—and a jest—from the Vasty universe.

Aproximate word count:

Bigotry:

Warnings:

- - -

Consternation reigned in Elsnore village when the Nameless Thing was discovered in Farmer Burns' corn-patch. When the rumor began to gain credence that it was some sort of meteor from inter-stellar space, reporters, scientists and college professors flocked to the scene, desirous of prying off particles for analysis. But they soon discovered that the Thing was no ordinary meteor, for it glowed at night with a peculiar luminescence. They also observed that it was practically weightless, since it had embedded itself in the soft sand scarcely more than a few inches.

By the time the first group of newspapermen and scientists had reached the farm, another phenomenon was plainly observable. The Thing was growing!

Farmer Burns, with an eye to profit, had already built a picket fence around his starry visitor and was charging admission. He also flatly refused to permit the chipping off of specimens or even the touching of the object. His attitude was severely criticized, but he stubbornly clung to the theory that possession is nine points in law.

It was Professor Ralston of Princewell who, on the third day after the fall of the meteor, remarked upon its growth. His colleagues crowded around him as he pointed out this peculiarity, and soon they discovered another factor—pulsation!

Larger than a small balloon, and gradually, almost imperceptibly expanding, with its viscid transparency shot through with opalescent lights, the Thing lay there in the deepening twilight and palpably shivered. As darkness descended, a sort of hellish radiance began to ooze from it. I say hellish, because there is

no other word to describe that spectral, sulphurous emanation.

As the hangers-on around the pickets shudderingly shrank away from the weird light that was streaming out to them and tinting their faces with a ghastly, greenish pallor, Farmer Burns' small boy, moved by some imp of perversity, did a characteristically childish thing. He picked up a good-sized stone and flung it straight at the nameless mass!

Instead of veering off and falling to the ground as from an impact with metal, the stone sank right through the surface of the Thing as into a pool of protoplasmic slime. When it reached the central core of the object, a more abundant life suddenly leaped and pulsed from center to circumference. Visible waves of sentient color circled round the solid stone. Stabbing swords of light leaped forth from them, piercing the stone, crumbling it, absorbing it. When it was gone, only a red spot, like a bloodshot eye, throbbed eerily where it had been.

Before the now thoroughly mystified crowd had time

to remark upon this inexplicable disintegration, a more horrible manifestation occurred. The Thing, as though thoroughly awakened and vitalized by its unusual fare, was putting forth a tentacle. Right from the top of the shivering globe it pushed, sluggishly weaving and prescient of doom. Wavering, it hung for a moment, turning, twisting, groping. Finally it shot straight outward swift as a rattler's strike!

Before the closely packed crowd could give room for escape, it had circled the neck of the nearest bystander, Bill Jones, a cattleman, and jerked him, writhing and screaming, into the reddish core. Stupefied with soul-chilling terror, with their mass-consciousness practically annihilated before a deed with which their minds could make no association, the crowd could only gasp in sobbing unison and await the outcome.

The absorption of the stone had taught them what to expect, and for a moment it seemed that their worst anticipations were to be realised. The sluggish currents circled through the Thing, swirling the victim's body to the center. The giant tentacle drew

back into the globe and became itself a current. The concentric circles merged—tightened—became one gleaming cord that encircled the helpless prey. From the inner circumference of this cord shot forth, not the swords of light that had powdered the stone to atoms, but myriads of radiant tentacles that gripped and cupped the body in a thousand places.

Suddenly the tentacles withdrew themselves, all save the ones that grasped the head. These seemed to tighten their pressure—to swell and pulse with a grayish substance that was flowing from the cups into the cord and from the cord into the body of the mass. Yes, it was a grayish something, a smokelike Essence that was being drawn from the cranial cavity. Bill Jones was no longer screaming and gibbering, but was stiff with the rigidity of stone. Notwithstanding, there was no visible mark upon his body; his flesh seemed unharmed.

Swiftly came the awful climax. The waving tentacles withdrew themselves, the body of Bill Jones lost its rigidity, a heaving motion from the center of the Thing propelled its cargo to the surface—and Bill Jones

stepped out!

Yes, he stepped out and stood for a moment staring straight ahead, staring at nothing, glassily. Every person in the shivering, paralysed group knew instinctively that something unthinkable had happened to him. Something had transpired, something hitherto possible only in the abysmal spaces of the Other Side of Things. Finally he turned and faced the nameless object, raising his arm stiffly, automatically, as in a military salute. Then he turned and walked jerkily, mindlessly, round and round the globe like a wooden soldier marching. Meanwhile the Thing lay quiescent—gorged!

Professor Ralston was the first to find his voice. In fact, Professor Ralston was always finding his voice in the most unexpected places. But this time it had caught a chill. It was trembling.

"Gentlemen," he began, looking down academically upon the motley crowd as though doubting the aptitude of his salutation. "Fellow-citizens," he corrected, "the phenomenon we have just witnessed

is, to the lay mind, inexplicable. To me—and to my honorable colleagues (added as an afterthought) it is quite clear. Quite clear, indeed. We have before us a specimen, a perfect specimen, I might say, of a—of a —"

He stammered in the presence of the unnamable. His hesitancy caused the rapt attention of the throng that was waiting breathlessly for an explanation, to flicker back to the inexplicable. In the fraction of a second that their gaze had been diverted from the Thing to the professor, the object had shot forth another tentacle, gripping him round the neck and choking off his sentence with a horrid rasp that sounded like a death rattle.

[Image description start: A black and white illustration, showing the glowing sphere reaching out a tentacle to grab the suited professor, while the crowd watches on in horror. Image description end.]

Needless to say, the revolting process that had turned Bill Jones from a human being into a mindless automaton was repeated with Professor Ralston. It happened as before, too rapidly for intervention, too suddenly for the minds of the onlookers to shake off

the paralysis of an unprecedented nightmare. But when the victim was thrown to the surface, when he stepped out, drained of the grayish smokelike essence, a tentacle still gripped his neck and another rested directly on top of his head. This latter tentacle, instead of absorbing *from* him, visibly poured into him what resembled a threadlike stream of violet light.

Facing the cowering audience with eyes staring glassily, still in the grip of the unknowable, Professor Ralston did an unbelievable thing. He resumed his lecture at the exact point of interruption! But he spoke with the tonelessness of a machine, a machine that pulsed to the will of a dictator, inhuman and inexorable!

"What you see before you," the Voice continued—the Voice that no longer echoed the thoughts of the professor—"is what you would call an amoeba, a giant amoeba. It is I—this amoeba, who am addressing you—children of an alien universe. It is I, who through this captured instrument of expression, whose queer language you can understand, am explaining my presence on your planet. I pour my thoughts into this

specialised brain-box which I have previously drained of its meager thought-content." (Here the "honorable colleagues" nudged each other gleefully.) "I have so drained it for the purpose of analysis and that the flow of my own ideas may pass from my mind to yours unimpeded by any distortion that might otherwise be caused by their conflict with the thoughts of this individual.

"First I absorbed the brain-content of this being whom you call Bill Jones, but I found his mental instrument unavailable. It was technically untrained in the use of your words that would best convey my meaning. He possesses more of what you would call 'innate intelligence,' but he has not perfected the mechanical brain through whose operation this innate intelligence can be transmitted to others and, applied for practical advantage.

"Now this creature that I am using is, as you might say, full of sound without meaning. His brain is a lumber-room in which he has hoarded a conglomeration of clever and appropriate word-forms with which to disguise the paucity of his ideas, with

which to express nothing! Yet the very abundance of the material in his storeroom furnishes a discriminating mind with excellent tools for the transportation of its ideas into other minds.

"Know, then, that I am not here by accident. I am a Space Wanderer, an explorer from a super-universe whose evolution has proceeded without variation along the line of your amoeba. Your evolution, as I perceive from an analysis of the brain-content of your professor, *began* its unfoldment in somewhat the same manner as our own. But in your smaller system, less perfectly adjusted than our own to the cosmic mechanism, a series of cataclysms occurred. In fact, your planetary system was itself the result of a catastrophe, or of what might have been a catastrophe, had the two great suns collided whose near approach caused the wrenching off of your planets. From this colossal accident, rare, indeed, in the annals of the stars, an endless chain of accidents was born, a chain of which this specimen, this professor, and the species that he represents, is one of the weakest links.

"Your infinite variety of species is directly due to the variety of adaptations necessitated by this train of accidents. In the super-universe from which I come, such derangements of the celestial machinery simply do not happen. For this reason, our evolution has unfolded harmoniously along one line of development, whereas yours has branched out into diversified and grotesque expressions of the Life-Principle. Your so-called highest manifestation of this principle, namely, your own species, is characterized by a great number of specialized organs. Through this very specialization of functions, however, you have forfeited your individual immortality, and it has come about that only your life-stream is immortal. The primal cell is inherently immortal, but death follows in the wake of specialization.

"We, the beings of this amoeba universe, are individually immortal. We have no highly specialized organs to break down under the stress of environment. When we want an organ, we create it. When it has served its purpose, we withdraw it into ourselves. We reach out our tentacles and draw to

ourselves whatsoever we desire. Should a tentacle be destroyed, we can put forth another.

"Our universe is beautiful beyond the dreams of your most inspired poets. Whereas your landscapes, though lovely, are stationary, unchangeable except through herculean efforts, ours are Protean, eternally changing. With our own substance, we build our minarets of light, piercing the aura of infinity. At the bidding of our wills we create, preserve, destroy—only to build again more gloriously.

"We draw our sustenance from the primates, as do your plants, and we constantly replace the electronic base of these primates with our own emanations, in much the same manner as your nitrogenous plants revitalize your soil.

"While we create and withdraw organs at will, we have nothing to correspond to your five senses. We derive knowledge through one sense only, or, shall I say, a super-sense? We see and hear and touch and taste and smell and feel and know, not through any one organ, but through our whole structure. The

homogeneous force of our omni-substance subjects the plural world to the processing of a powerful unity.

"We can dissolve our bodies at will, retaining only the permanent atom of our being, the seed of life dropped on the soil of our planet by Infinite Intelligence. We can propel this indestructible seed on light rays through the depths of space. We can visit the farthest universe with the velocity of light, since light is our conveyance. In reaching your little world, I have consumed a million years, for my world is a million light-years distant: yet to my race a million years is as one of your days.

"On arrival at any given destination, we can build our bodies from the elements of the foreign planet. We attain our knowledge of conditions on any given planet by absorbing the thought-content of the brains of a few representative members of its dominant race. Every well-balanced mind contains the experience of the race, the essence of the wisdom that the race-soul has gained during its residence in matter. We make this knowledge a part of our own thought-content, and thus the Universe lies like an open book before

us.

"At the end of a given experiment in thought absorption, we return the borrowed mind-stuff to the brain of its possessor. We reward our subject for his momentary discomfiture by pouring into his body our splendid vitality. This lengthens his life expectancy immeasurably, by literally burning from his system the germs of actual or incipient ills that contaminate the blood-stream.

"This, I believe, will conclude my explanation, an explanation to which you, as a race in whom intelligence is beginning to dawn, are entitled. But you have a long road to travel yet. Your thought-channels are pitifully blocked and criss-crossed with nonsensical and inhibitory complexes that stand in the way of true progress. But you will work this out, for the Divine Spark that pulses through us of the Larger Universe, pulses also through you. That spark, once lighted, can never be extinguished, can never be swallowed up again in the primeval slime.

"There is nothing more that I can learn from you—

nothing that I can teach you at this stage of your evolution. I have but one message to give you, one thought to leave with you—forge on! You are on the path, the stars are over you, their light is flashing into your souls the slogan of the Federated Suns beyond the frontiers of your little warring worlds. Forge on!"

The Voice died out like the chiming of a great bell receding into immeasurable distance. The supercilious tones of the professor had yielded to the sweetness and the light of the Greater Mind whose instrument he had momentarily become. It was charged at the last with a golden resonance that seemed to echo down vast spaceless corridors beyond the furthestmost outposts of time.

As the Voice faded out into a sacramental silence, the strangely assorted throng, moved by a common impulse, lowered their heads as though in prayer. The great globe pulsed and shimmered throughout its sentient depths like a sea of liquid jewels. Then the tentacle that grasped the professor drew him back toward the scintillating nucleus. Simultaneously another arm reached out and grasped Bill Jones, who,

during the strange lecture, had ceased his wooden soldier marching and had stood stiffly at attention.

The bodies of both men within the nucleus were encircled once more by the single current. From it again put forth the tentacles, cupping their heads, but the smokelike essence flowed back to them this time, and with it flowed a tiny threadlike stream of violet light. Then came the heaving motion when the shimmering currents caught the two men and tossed them forth unharmed but visibly dowered with the radiance of more abundant life. Their faces were positively glowing and their eyes were illuminated by a light that was surely not of earth.

Then, before the very eyes of the marveling people, the great globe began to dwindle. The jeweled lights intensified, concentrated, merged, until at last remained only a single spot no larger than a pin-head, but whose radiance was, notwithstanding, searing, excruciating. Then the spot leaped up—up into the heavens, whirling, dipping and circling as in a gesture of farewell, and finally soaring into invisibility with the blinding speed of light.

The whole wildly improbable occurrence might have been dismissed as a queer case of mass delusion, for such cases are not unknown to history, had it not been followed by a convincing aftermath.

The culmination of a series of startling coincidences, both ridiculous and tragic, at last brought men face to face with an incontestable fact: namely, that Bill Jones had emerged from his fiery baptism endowed with the thought-expressing facilities of Professor Ralston, while the professor was forced to struggle along with the meager educational appliances of Bill Jones!

In this ironic manner the Space-Wanderer had left unquestionable proof of his visit by rendering a tribute to "innate intelligence" and playing a Jovian Jest upon an educated fool—a neat transposition.

A Columbus from a vaster, kindlier universe had paused for a moment to learn the story of our pigmy system. He had brought us a message from the outermost citadels of life and had flashed out again on his aeonic voyage from everlasting unto everlasting.

#28 The Atom-smasher, By Victor Rousseau Emanuel:

Four destinies rocket through the strange time-space of the fourth dimension in Tode's marvelous atom-smasher.

Aproximate word count: 26,100

Bigotry: Antiblack racism, misogyny

Warnings: Extreme antiblackness, specifically against Aboriginal Australians. Victor Emanuel really fucking hates Black people. It's disgusting.

Chapter 1: The "Vanishing Place"

"Look at that plane! That fellow's crazy! Took off with the wind behind him! He'll nose dive before he clears the clubhouse! He'll crash into those trees along the edge of the golf course!"

The group on the field at Westbury, Long Island, held

their breaths as they watched James Dent take off in the wildest, most erratic flight that they had ever seen. Under lowering storm clouds, with the wind roaring half a hurricane behind him, Dent spiraled upward as if unconscious of the laws of Earthly gravity.

"I told you so! You ought to have stopped him, even if it is his private plane! A feller's got no business trying to break his neck! Look there! He's cleared those trees after all!"

James Dent had cleared them, and the clubhouse too, and was already disappearing across the Hempstead Plains, looking like a leaf whirling up in a winter storm. At a height of five hundred feet he sped eastward.

"Didn't tell you where he was going?"

"Nope, acted like a crazy man. Something on his mind sure. Wherever he's bound for, he'll never get there!"

ut James Dent was already out of sight, and the little

group dispersed. And Dent, winging his way due east, over the oak barrens of central Long Island, was conscious neither of the storm that howled about him nor of the excitement that his rash take-off had occasioned.

The rain lashed him in the open cockpit, the ground fog swirled about him, and, though it was still afternoon, there brooded a somber twilight over the wastes. But in his mind Dent was already anticipating his descent at the "Vanishing Place," as the natives called it near Peconic Bay.

The "Vanishing Place" was so called because of the terrible and inexplicable catastrophe that had occurred there five years previously. In the two-century-old farmhouse, Miles Parrish, the world's greatest authority on physical chemistry, had been conducting investigations into the structure of the atom.

James Dent and Lucius Tode had been associated with old Parrish in this work, which, carried to a successful issue, would revolutionize the social organization of

the world. The energy locked up in the atom is so stupendous that, as Eddington indicated, a thimbleful of coal, disintegrated, would carry the *Mauretania* from England to America and back again. To unlock this energy would be to set man free from bondage, to restore the pristine leisure and happiness of Eden.

And because the three men were playing with deadly forces, of incalculable power, this deserted spot had been selected for the carrying on of the investigations. The old farmhouse had been converted into a laboratory. For days together the three had bent over their tubes and laboratory apparatus, hardly eating or sleeping. And the day had come when success had seemed almost within their grasp.

Dent had received six months' leave of absence from his duties at Columbia University in order to prosecute the experiments. As the weeks went by, and the blind track that the three were following opened into a clear road, a sort of madness settled upon every one of them.

The Planck-Bohr quantum theory that the energy of a

body cannot vary continuously, but only by a certain finite amount, or exact multiples of this amount, had been the key that unlocked the door. But always it had been Lucius Tode who led the way. Tode was a graduate of the University of Virginia, and accounted one of the most brilliant minds of his generation. At thirty, he stood head and shoulders above his contemporaries.

Dark, handsome, fearless, with a will power that nothing seemed able to subdue, he had taken the leadership away from old Miles Parrish, who eagerly and without thought of his own reputation followed in his assistant's footsteps.

There were the three men—and there was the girl, Lucille Parrish, the child of Miles's old age.

Seventeen, when the catastrophe occurred, she had come out to the deserted spot sometimes of a Sunday from her boarding school at Garden City.

And Tode had found time to make love to her when he rushed her back to her school in his high-powered foreign car!

Jim Dent had known nothing of that until after the catastrophe. Lucille had been afraid of him, afraid to open her mouth upon the subject even to her father. And she had been fascinated too, as a young girl may well be, when a fascinating man of thirty uses his arts to win her.

It was only by chance that Jim had failed to be involved in the hideous catastrophe that had stamped the old farmhouse with the name of "Vanishing Place" whenever the natives spoke of it.

"Two Killed in Laboratory Explosion!" was the heading in the next morning's paper which gave Jim his first intimation of the accident. He had been to Columbia overnight to look up a new publication that contained an article on the hydrogen spectrum.

It was only a long paragraph, and the names of Parrish and Tode meant nothing to the man who had written it. But Jim had taken train to Hempstead, taxied to the flying fields, and essayed his first plane ride to Peconic Bay, in the charge of a pilot.

A group of natives, three newspaper men and a Suffolk County policeman were near the spot where the farmhouse had been—near the spot, not on it.

For where the farmhouse had been was a great pool of stagnant water, black as ink, covering an expanse of perhaps three-quarters of an acre.

"No, sir, there was no explosion," said the officer. "At least, none of these fellows heard anything. Just a—you tell the Professor, Mr. Lumm."

"It was about half-past eight last night, Mr. Dent," said Andrew Lumm, who kept the village store a mile away. "Ground seemed to rock. Earthquake, I says to myself, holdin' on to the door. But it wasn't no earthquake. Too gentle for that. Nothin' broke, not even a plate. Then I says to Mrs. Lumm, 'They're gone, poor fellers, and I allus knowed it would be that way. It's lucky young Mr. Dent went out last night on the 7.15.'

"We hurried here, but there wasn't no sign of the place, jest a hole on the ground with a sort of sticky

mud in it. Water's been fillin' in since then, but I guess it's reached its level now. They jest blowed themselves to bits, Mr. Dent."

"Tell him about the vi'let light, Andy," put in one of the bystanders.

"Yeah, like a pillar of vi'let fire that were, Mr. Dent. We seed it through the trees, but by the time we got here it was 'most gone. Gosh, that throwed a scare into some of us!"

"It was Mr. Tode's soul a-burnin'," squeaked Granpop Dawes. "I allus said that feller'd come to no good end."

The group shook their heads and remained silent. It was clear that, if they did not share Granpop Dawes's opinion, at least they considered it not without the bounds of plausibility. Lucius Tode had created a bad impression among the natives.

Jim Dent stooped and picked up something lying imbedded in the mud at the edge of the black pool,

and slipped it into his pocket. He had been present at the inquest and had gone back to Columbia. That had been five years before.

Professor McDowd, the palaeontologist, had identified the object Jim had found as the milk molar of *merychippus insignis*, the miocene representative of the modern horse. And that had made Jim Dent think furiously.

The catastrophe must have been a gigantic one to have flung up that fossil tooth from strata far beneath the level of the earth's surface. More, there were even traces of archaean deposits around the borders of the pool, whose depth, in the center, was ascertained to be 164 feet.

Black, silent, uninhabited, unstirred save by a passing breeze, the pool had remained those five years past. The spot was shunned as haunted or accursed by the superstitious country folks. Dense underbrush had grown up around it.

Periodically, Jim had gone out to visit it. That was how

he had come to invest in a private plane. It was only an hour to the flying-fields, and less than an hour from there to Peconic Bay. What he expected to achieve he did not know. In the back of his mind was the belief that some day he would light upon some clue that would tell something of the unusual catastrophe.

And then that afternoon he had been shaken to the depths when a message came to him in Lucille's voice over the telephone:

"I've heard from dad!"

Winging his way eastward through the storm, Jim Dent was mentally reconstructing all that had led up to the present moment.

Lucille had finished her high school course and gone into business life. Jim had found a position for her as secretary to a small group of physicists, who were conducting private investigations, a position for which her training well fitted her. She had done well. He had kept in touch with her.

Six months before, their relations had altered. They had realized that they were in love with each other. In the months that followed they had discovered all sorts of things about each other that neither had suspected, which might be summed up by saying that they had become all in all to each other.

It was so amazing, this transformation of ordinary friendship into radiant love, that they were still bewildered over it. They were to be married at the end of the year.

It was then that Lucille had first told Jim about Lucius's wooing, and her fear of the man. Apart from that, both had refrained, by tacit agreement, from making reference to the past.

And then, that afternoon, there sounded Lucille's voice over the telephone, "I've heard from dad!"

"From—your father? You're mistaken, dear!"

"No, Jim, I'm not mistaken. He called me on the 'phone two hours ago. I couldn't mistake his voice,

and, besides, he called me "Lucy," like he used to do. He told me to come at once to the Vanishing Place, but not to tell a soul unless I wished to do him a great evil. Then he rang off."

"Where are you now?" asked Jim.

"I'm 'phoning from Amityville. I took the train immediately, but I was so frightened, and—and at last I decide I must tell you. I didn't think dad would have minded my telling you. So I got out. There's another train in a few minutes, and I shall go on to Hampton Bays and walk the two miles to the Vanishing Place. I—I'll meet you there."

"Lucille, wait! Can't you meet me somewhere else, and we'll go on together. I'll get my plane and—"

"Oh, I just can't wait, Jim! I'm in such terror that I won't find dad when I get there. And he told me to tell nobody. I—I'll meet you at the Vanishing Place, Jim."

And so great had been her agitation that with that arrangement Jim had had to rest content. He had

taken a taxi out to the flying fields at once.

In half an hour he would know what had happened. And he was obsessed by the terror that he would not find Lucille or anything except the lonely pool.

That was why he opened the throttle and drove on wildly through the scurrying wraiths of mist, pierced by the tops of trees that at times rose dangerously near the spreading wings.

That gap in the trees was Lake Ronkokoma. Not far now! Jim would know soon. But as he flew, vague fears that had beset his mind since he had received Lucille's message began to crystallize into the single fear of Tode. If Parrish was really alive—why not Tode too?

Beneath the polish and the surface comradeship, Jim had always been conscious of some *diablerie* about the man, of some inner life of which he knew nothing. Something unscrupulous and relentless, something infinitely cruel—as when he had tested the Atom Smasher on a stray cur that had run into the

laboratory, not for experimentation, but in mere ruthless savagery, converting the living beast instantly into a shapeless mass of flesh and bone.

And Tode had known more about the Atom Smasher—as they affectionately called the mechanism for releasing atomic energy—than old Parrish and he together. Suppose Lucille's story were true! Suppose old Parrish were actually alive, suppose Tode were responsible for some designed scheme which would, in the end place Lucille in his power!

Wild thoughts and fears—but Jim would soon know. And with throttle stretched to the limit he went roaring over the scrub oak toward Peconic Bay.

It was beginning to grow dark, almost too dark for landing. But now Jim could feel the tang of the salt wind upon his face. He slowed down. The fog was as thick as ever, but the scrub oak had given place to more open country. In a minute or two he ought to sight some landmark. Yes, he had overshot his mark, for suddenly, through a gap in the mists, he saw the line of breakers forming a white ridge upon the sand.

A mile southward! Jim knew where he was now, for he knew every curve of that shore. He banked and turned. And then he saw something that for an instant chilled his blood.

Not far away, and not far beneath him, a ghostly violet haze was spreading through the fog, and the fog itself was coiling back from it until it formed a dense white wall.

For a moment Jim's hand was paralysed upon the stick. The next, his decision was made. He closed his throttle and went down in a slow descent right toward the heart of that column of lavender smoke that seemed to be springing straight up out of the ground. "A pillar of violet fire!" It could not have been described better.

The plane dived through the dense wall of fog, which for a moment shut out the violet fire completely. Then Jim was through, and almost immediately beneath him lay the black and glassy surface of the pool. Out of the very heart of it rose the fire, burning like some infernal flame that consumed nothing, and between it

and the fog was a space of almost translucent air, extending to the borders of the pool.

Jim began to circle the pool to find a landing-place. But as he looked down, the surface of the pool began to change its aspect.

In place of the unruffled calm, it began to work with some devil's yeast all around the central pillar of flame, until its depths seemed to be churned up in frothy masses and the movement extended almost to the circumference. Then the whole surface of the water began to tilt and sway with a slow, shimmering, undulatory movement, as if it was a giant roulette wheel in rotation.

And something was materializing out of the heart of the violet flame itself.

It was a face—a human face, with bestial features, distorted and enormously magnified through the substance in which it was. Such a face as might look back upon an observer out of one of those distorting mirrors at Coney Island, or some other place of

popular amusement, but twisted and enlarged beyond conception, so that it covered half the area of a city block.

Curiously blurred, too, as if each atom of that face was in isolated motion on its own account. And beneath the face appeared the vague outlines of a hand, apparently manipulating some sort of infernal mechanism.

And that face, enlarged as it was out of all proportion, filled Jim's heart with greater horror than any face he had ever known.

For it was the visage of Lucius Tode, and on those huge and distorted features was something that looked like a diabolical smile.

Everything vanished. Jim was back in the surrounding wall of fog. Instinctively he banked again. He strove to drive the horror from his brain. He must circle, circle incessantly, in the hope of finding Lucille. She must have already arrived. But if she had not fallen into Tode's power, she would hear the roaring of the

plane and manage to signal him.

He circled back into the clear space between the white and the violet, and now he saw that the effect upon the pool was still more pronounced. The waters were rising up in a rim all around, and yet not overflowing. They were standing up like a bowl of clay upon the potter's wheel, and down in the depths Jim could see the head and shoulders of Tode, much less magnified, more natural in appearance, and less blurred. And Tode was looking up at him and pointing that infernal mechanism at him—something that looked like the tube of a telescope.

Suddenly the plane shivered and stood still. The motor died abruptly. The stick went dead. And yet the plane did not fall. As if upheld by the same repulsive force that drove back the white fog, it simply hung suspended three hundred feet above the heart of the violet flame.

Then—there was no longer any plane. The stick had melted in Jim's hand, the wings dissolved like wreaths of mist. The entire body had disintegrated into

nothingness. Jim sat suspended in the void, and felt himself very slowly descending into the violet column.

Down into the vortex of that bubbling pool, which rimmed him on all sides ... down into the central aperture out of which emerged the leering face of Tode! And as he dropped Jim heard, thin, faint, and very far away, the despairing cry of Lucille....

Chapter 2: *Old Friends—and Foes*

Jim must have lapsed into unconsciousness, for when he opened his eyes there was a gap in his consciousness of the passage of time, though none in his memory. He opened his eyes, and instantly he remembered everything.

Only a brief interval could have elapsed, for it was not quite dark. The fog and the violet flame had cleared away. Overhead a few stars twinkled. Jim was lying on his side, half-buried in the black, slimy mud of the dried up pool.

There was nothing but the smooth, shelving mud

basin, with the scrub oak surrounding it. Tode and the machine had vanished.

Jim pulled himself with an effort out of the sucking mud, and, heavily clogged with it, began to make his way toward the margin.

Stumbling, struggling through the viscid ooze, he shouted Lucille's name despairingly. But no answer came, and his cries only made the utter silence all about him seem more fearsome.

Exhausted by his efforts, he gained the edge of the pool at last, and stopped, trying to orientate himself. As he did so, he saw a human face peering at him out of a clump of scrub oak.

It was the face of an aged man, with a long white beard and rags of clothes that were festooned about him. Jim took a step toward it, shouting a challenge. Next moment it had hurled itself out of its shelter toward him, and two skeletonlike arms were twined about his shoulders, while the fingers worked upward toward his throat.

The face was that of a madman, crazed by fear. And Jim recognized it. It was the face of Professor Parrish.

Parrish, the trim, immaculate, clean-shaven, urbane old man, whose lectures, imbued with wit and scholarship, had always been the delight of his classes—Parrish reduced to this gibbering maniac! And yet Parrish himself, returned to the site of their experiments after five years!

So fierce was the old man's onset, so desperate his clutch, that for a half-minute or more Jim was reduced to fighting for his life. The clawing fingers, armed with long nails, furrowed Jim's throat, there was a terrific strength in the body, wasted though it was almost to a skeleton.

But it was only for a half-minute that old Parrish's endurance lasted. Suddenly the old man went limp and tottered forward, dropped upon the ground. Jim bent over him.

"Parrish, you know me! I'm Jim Dent!" he cried. "I came here to save you."

Parrish was muttering something. Jim caught the words "Tode," and "God help Lucille!"

"Parrish, I'm Jim Dent!" Jim cried again, and the old man, shuddering, opened his eyes and recognized him.

"Jim!" he muttered. "Jim Dent! Then where is she? I got away from that devil, found farmhouse empty, got telephone book, found her and 'phoned her. Told her to come. Save—Lucille!"

He fell back, his eyes closed. Jim crouched over the unconscious old man. He was in a state of utter perplexity. He could not quite gather what Parrish had been trying to tell him, and it was with difficulty that he could focus his mind upon the situation, so great had been the shock of finding his former chief in that condition.

What had become of his plane, and where was Lucille? Jim was positive that he had heard her cry for help out of the vortex in the water.

But there was no water, only the circle of black mud extended in the starlight.

Again and again Jim shouted Lucille's name, and his cries went echoing away through the scrub without result.

Jim looked down at the unconscious old man beside him. He must get Parrish away, get him to Andy Lumm's. He bent over him again and raised him in his arms.

Suddenly he heard two familiar sounds behind him, two dull thumps that sounded less like explosions than echoes, long drawn out, and receding into infinity. There was no other sound quite like them that he had ever heard.

They were the snap of the electrical discharge as the Atom Smasher began to operate, and why the snap had sounded like a heavy body falling a long distance away, was not known.

Tode had said one day, with what Jim had taken for

sarcasm, that they represented the wave series of a single sound extended in time to make four-dimensional action, but Jim had never considered the explanation seriously.

That sound, bringing back all Jim's memories of their experiments, brought him to his feet sharply. He swung around. The surface of the pool was a bubbling, seething mass of mud and water. And over its surface that faint violet haze was beginning to spread.

In the center where the light was thickest, something like a gyroscope appeared to be revolving. Out of the gyroscope something was beginning to project—that infernal tube of Lucius Tode. And Jim knew that in the heart of the flame that enormous, distorted face of Lucius Tode would again be visible.

The human nervous system can only endure a certain amount of impact. The sight of that ghastly flame, already condensing into a violet pillar, was more than Jim could stand. He dragged old Parrish to his feet and started off with him into the thickest part of the

undergrowth.

A fearful scream behind him stopped him at the very edge of the scrub. He looked back, still supporting the half-conscious old man in his arms. The violet flame was shooting up in a straight pillar, the whole central portion of the pool was dry, and the waters were heaped up all around it.

From the slightly elevated spot where Jim stood, he could see Tode holding Lucille in his arms in the very heart of the fire, which threw a pale, fluorescent light over their faces. Tode was wearing a spotted skin, like that of a leopard, and Lucille was in the blue frock that she had worn when Jim and she had dinner together two evenings before.

Jim dropped old Parrish, shouted in answer, and dashed back like a madman down the slope into the solid wall of water.

He fought his way desperately through that wall, which seemed of the consistency of soft rubber or treacle, as if some subtle change had taken place in

its molecular isomers. It adhered to him without wetting him, and he plunged through it, hearing Lucille cry out again, and yet again.

And now he was through, and once more struggling over the viscid surface of the pond. Behind him he heard old Parrish blundering, and screeching at the top of his voice, but he paid no attention to him.

He could see Lucille more clearly, and the large, hazy outlines of Tode's features were beginning to assume the proper proportions. There was a diabolical leer upon Tode's face, unchanged during the five years since Jim had seen him last, except that it had become more evil, more powerful. The enormous and distorted face that Jim had seen had been simply due to the presence of some refracting medium.

The pillar of violet light was thinning, spreading out over the pool, but Jim could now see the scene more clearly than before, even as he rushed onward.

The machine was inside what looked like a flat boat, but more circular than a boat, and apparently was

made of some metal resembling aluminum. Either from the metal hull or from the mechanism inside it there was emitted a pungent odor resembling chlorine.

The mechanism itself bore some resemblance to the old Atom Smasher of five years before, but it appeared to be immensely more complicated. Wheels of various sizes were set at every conceivable angle around the central tube, from which the violet light was emanating, and all were rotating and gyrating so fast that they looked like discs of light. The boat itself was trembling, and this movement appeared to be communicated to the boiling mud in the central part of the pool.

As Jim tried to leap down through the sucking mud to snatch Lucille from Tode, the latter stopped, straightened himself, and pointed a short tube at Jim's heart.

Jim felt as if an enormous, invisible force had struck him in the chest. It was apparently the same repulsive force that had driven back the waters. The shock was

not a violent one. It did not throw him off his feet. It merely pushed him slowly and irresistibly backward.

And the whole picture was beginning to fade. Etched sharply in the violet light one moment, it now looked like a drawing that had been covered with tissue paper.

The outlines were dissolving into a haze—or, rather, each line seemed reproduced an infinite number of times, as the edge of a vibrating saw shows an infinitude of edges. The violet fire was becoming still more diffused. It hovered over the waters, a pale, flickering glow. And simultaneously the walls of water began to break and come surging forward.

Jim saw Lucille stretching out her arms toward him, and tried to struggle forward, but in vain. She cried out his name, and he put all his strength into that desperate futile struggle to reach her. But he was being borne backward by the invisible power in the tube. The rushing torrent was surging about his knees; grew waist deep: in another moment Jim was swimming for his life against the furious flood.

Suddenly, however, the tremendous pressure on his chest was relaxed. Tode had turned the tube away from him. He was leaning forward out of the boat and grasped old Parrish, who had been flung violently against it by the dissolving waters.

The same flood carried Jim to the boat's side. Here, however, the flood was only knee deep, owing to the repulsion still being exercised by the violet light, which was glimmering feebly. Jim found his feet and leaped into the craft. He grasped Lucille in his arms.

He turned to confront Tode, who had just dragged old Parrish over the side. The three men confronted one another.

"Turn that tube on me, and I'll jump into your damn machinery and bust it!" Jim shouted.

An ironical expression came on Tode's face. It was clear that he still considered himself master of the situation. "At the immediate moment, Dent, the lives of all of us depend upon your keeping absolutely still," he answered. "Take my advice and sit down!"

Jim saw Lucille's face, ghastly in the faint violet light that played about it. The girl had fainted. She was lying unconscious, her feet against the circular metal plate that protected the machinery, her head upon the rail that ran around the boat's upper edge. Tode, without waiting for Jim's answer, stepped over the plate and took his seat at a sort of instrument board with control levers and thumb screws that apparently controlled the needles on four dials. He touched a button, and instantly the violet light disappeared.

With its vanishing, the waves came surging forward, and lapped violently against the hull, as if about to overwhelm the vessel, which, however, seemed immovable. It simply rose higher in the water.

Jim understood the cause of this. Those gyroscopes would retain the hull in the same position against anything but a mechanical force strong enough to ruin it. He watched Tode as he sat at the instrument board, which was illuminated by two tiny lights of what looked like mercury-vapor. His face, handsome and cruel as ever, was tense as he manipulated the thumb screws. Beside him lay Parrish, faintly

whimpering. The old man had evidently abandoned all hope of effecting his escape, or of rescuing his daughter.

It was unbearable to have to sit there, knowing that the three of them were absolutely at Tode's mercy, and yet there was nothing else to do.

Tode looked up with a saturnine smile. "It's a delicate operation to blur the present without shooting out a hundred years or so in time," he said, "but my micrometer's pretty accurate, Dent. Don't move, I caution you!" He smiled again. "Yes, Dent, time is something like the fourth dimension of space, as we believed in the old days, and I've proved it."

Jim saw Tode touch the screw that controlled the fourth dial, and instantly it was borne in on him that each of the dials controlled one spatial dimension. This fourth, then, was the time dimension!

Could it be true that Tode had solved the practical problem of traveling in time, theoretically implied since the discoveries of Einstein?

He had known in the old days that the Atom Smasher might be adapted to this purpose, but neither Parrish nor he had dreamed of turning aside from their endeavor to utilize it for the purpose of releasing atomic energy.

Thump! Thump! The familiar old sound, rushing back into memory after all those years, the release of the electrical discharge, echoing through infinity! The scrub around the pool blurred and was gone. A vast gray panorama extended itself on either side of them.

They were travelling—in space—and time too. Jim no longer doubted. And, chilled with horror, he sat there, his arm about Lucille's unconscious form.

Chapter 3: *Into the Infinite*

How long he sat there he did not know. Minutes or hours seemed all the same to him. Nothing but that gray monochrome, of neither light nor darkness, that endless panorama of miles and years, blended

together into this chaos!

But suddenly there came a shout from Tode. The blur ceased, the lights flickered. Again there sounded the two thumps of the electrical discharge. The vibrating mechanism grew steady. Above them, out of the grayness, a moon disclosed itself, then the pin-points of stars. All about them was an immense, sandy waste.

"Know where we are, Dent?" came Tode's chuckle.

Jim was not sufficiently master of himself to attempt to answer.

"We are on what will be the Russian steppes some fifty thousand years ahead of us in time," grinned Tode. "This is an interlude between two ice ages. Observe how pleasantly warm the climate is, for Russia. Unfortunately the receding glaciers carried off the top-soil, which accounts for the barrenness of the district, but in another century this country will be overgrown with ferns, and inhabited by the mastodon and wild horse, and a few enterprising

palaeolithic hunters, who will come in to track them down and destroy them with their stone axes."

"I think you're the same sort of damn liar you always were, Tode," answered Jim—but without conviction. There was something terrific about that desolation. Nothing within a thousand miles of Long Island corresponded to it.

"You'll be convinced pretty quickly, when you see my specimen," answered Tode. "I let him off here on the way to the pool. He's not exactly presentable, and when I got the idea of picking up Lucille and taking her back with me, I thought it best not to let her see him. He didn't want to be let off. Was afraid I wouldn't pick him up again, and I'll admit it was a matter of pretty careful reckoning. But this is the place, almost to the yard.

"Yes, I've done some close reckoning, Dent, but the cleverest part of the business was letting old Parrish think he'd got away from me. I knew he'd telephone Lucille. You know, I always had the brains of the outfit, Dent," he continued, with a smirk of self-

satisfaction.

He looked out of the boat. "And here, if I'm not mistaken, comes my specimen," he added.

Something was running across the steppes toward them. It came nearer, took human form. It was human! A man—but such a man as Jim had never seen before outside the covers of a book. And he recognised the race immediately.

It was a Neanderthal man, one of the race that co-existed with the highly developed Cro-Magnons some thirty thousand years ago. Man and not ape, though the face was bestial, and there were huge ridges above the eyebrows.

And if Jim had needed conviction, the sight of this gibbering creature, now climbing into the boat and fawning upon Tode, convinced him. For the Neanderthal man vanished from the scene long before the beginning of recorded history.

For a few moments a deathly faintness overcame

him ... his eyes closed, he felt unconsciousness rushing in upon him like a black cloud.

"It's all right, Dent—don't look so scared!" came Tode's mocking voice.

Jim opened his eyes, shook off that cloud of darkness with an immense effort. The boat was throbbing violently as the wheels gyrated, the violet light had become a pillar as thick as a man, and shot straight up to a height of fifty feet, before it rolled away. Lucille was lying where she had been, her eyes still staring up unseeing at the stars. Old Parrish was whining and whimpering as he crouched in his place.

And at Tode's feet crouched the Neanderthal man, repulsive, bestial, even though hardly formidable, and filling the last vacant spot inside the boat. He was gibbering and mouthing as he fawned upon Tode and pressed his hand to his hairy face. He continued to crouch and looked up at his master with doglike eyes.

Repulsive, and yet man, not ape. Distinctly human, perhaps a little lower than the Australian aborigine,

the Neanderthal showed by his reverence that the human faculty of worship existed in him.

"Meet Cain, one of my Drilgoes," said Tode, with a grin. "A faithful servant. I left him here to wait for me on the return journey. Cain's just my pet name for him because he subsists on the fruits of the earth, don't you, Cain?"

The Drilgo grunted, and pressed Tode's hand to his repulsive lips, which were fringed with a reddish beard. Suddenly Tode began to laugh uproariously. "Feel anything wrong with your head, Dent?" he asked.

Dent put up his hand and pulled away a quantity of charred hair. His forehead began to itch, and, rubbing his finger across it, he realized that his eyebrows were gone. Tode laughed still louder.

"You've kept your teeth by about two seconds' grace, Dent, but I shouldn't be surprised if you needed dental attention shortly," he said. "What a pity dentists won't be invented for another forty or fifty

thousand years."

"You're a devil!" cried Jim.

"You see, the human body is very resistant to the Ray," Tode went on. "It almost seems as if there is an organizing principle within it. Even the animal tissues are resistant, though not to the same extent as the human ones. It takes about twenty seconds for the organized human form to be disintegrated. But hair and beaks and claws, being superficial matter, vanish almost as soon as the Ray is turned on them. Ten seconds more, and you'd have been obliterated, Dent, just as your plane was.

"Yes, rub your head. Your hair will probably grow again—if I decide to let you live. It rather depends upon what impression you make upon Lucille as a bald-headed hero. After all, I didn't invite you to accompany us. It's your own lookout."

Jim could find nothing to say to that. He was discovering more and more that they were all helpless in Tode's hands.

"Sit back!" snarled Tode suddenly. He gave the Drilgo a push that sent him sprawling into the bottom of the boat. "Dent, your life depends upon your absolute acquiescence to my proposals. I didn't like you particularly in the old days, any more than you liked me. I thought you were a fool. On the other hand, I've no active reason to hate you, at present. It may be that I can use you.

"Meanwhile we've got a longish journey before us, ten thousand years more, multiplied by the fourth power of two thousand miles. Seems simple? Well, I had to invent the mathematical process for it. Reckon in the gravitational attraction of the planets, and you'll begin to get an idea of the complexity of it. So, in vulgar parlance, we're not likely to arrive till morning."

He glanced at Lucille, who was still lying unconscious with Jim's arm about her. Then his eyes rose to meet Jim's, and a sneering smile played about his lips. That smile was the acknowledgment of their rivalry for the girl's affections. And it was more—it was a challenge.

Tode welcomed that rivalry because, Jim could see, he meant to keep him alive under conditions of servitude, to demonstrate to Lucille his superiority.

Tode turned his thumbscrews, and the two thuds resounded. The violet column sank down, the boat vibrated, the level stretch of land became a blur again. The moon and stars vanished. Once more the four were off on that terrific journey.

At first they seemed to be traversing space that was shot through by alternate light and darkness, so that at times Jim could see the other occupants of the boat clearly, while at other times there was only Tode visible at the instrument board, with the dark outlines of the Drilgo, Cain, sprawled at his feet. But soon these streaks seemed to come closer and closer together, until the duration of each was only a fraction of a second. And closer, until light and darkness blended into a universal gray. These, Jim knew, were the alternations of night and day.

They were traveling—incredible as it was—in time as well as space, though whether backward or forward

Jim could not know. From the presence of the Neanderthal man, however, Jim was convinced that Tode was taking them back more thousands of years, into the beginnings of humanity.

A fearful journey! A madder journey than Jim could have conceived of, had he not been a participant in it. He was losing all sense of reality. He was hardly convinced that he would not awaken in New York, to discover that the whole episode had been a dream.

Was this Lucille, the girl he loved ... with whom he had dined in New York only a day or two before ... this unconscious form, stretched out on the deck of the weird ship that was rushing through eternity? Or, rather, it was they who were rushing through space and time upon a stationary ship! What was reality, and what was dream, then?

Tode called "Come over here, Dent! I want to talk to you!"

Jim picked his way over the metal floor of the round boat, came up to Tode, and sat down beside him

above the sprawling form of the Drilgo, Cain.

"You were a fool to come here, Dent." Tode turned with a malicious smile from his seat at the instrument board. "You didn't have to come. I take it that you are in love with Lucille, you poor imbecile, and still cherish dreams of winning her. We'll take up that matter in due course.

"Do you think I've been idle during these five years of my exile? I've been too busy even to come back for the woman I was in love with. And do you know what I've been doing during all this hellish period? Charting courses, Dent! Mapping out all the planetary movements back for uncounted ages—roughly, crudely, of course, but the best I was able to. These are difficult seas to navigate, though they may not seem so. You fool," he added savagely, "why didn't you come in with me in the old days? I told you that the Atom Smasher could be used to travel through time, and you mocked at me as a dreamer.

"I chose my hour. When everything was ready, I set forth on the most desperate journey ever attempted

by man. Talk of Columbus!—he had nothing on me. I tell you, Dent, I've been back to the Archaean Age, back to the time when nothing but crawling worms moved on the face of the earth. And I've been forward to the time when an errant planet will disrupt the earth into a shower of lava—and I nearly wrecked the boat. Dent.

"I've won, Dent! I've won! I've solved the problem that gives man immortality! All the epochs that have existed since God first formed the world are mine to play with! I have seen myself as a puling infant, and as a greybeard. I have made myself immortal, because, with this machine, I can set back the clock of time. I have found a land where I am worshipped as a god."

Tode's eyes glittered with maniacal fires. He went on in a voice of indescribable triumph:

"I'm a god there, Dent. Do you want to know where that land is? It is Atlantis, sunk beneath the waves nine thousand years before recorded history opened. It is Atlantis, from which the Cro-Magnons fled in

their ships, to land on the coasts of Spain and France, and become the ancestors of modern man.

"In old Atlantis, still not wholly submerged, I have made myself a god. I have mastered the savage Drilgoes whom the Atlanteans oppressed. All the spoils of their ruined cities are at my disposal. And I came back to get Lucille, whom I had never ceased to love. Together Lucille and I will rule like god and goddess.

"Join me, Dent. I'm a god in Atlantis—a god, I tell you. The lesser races fear me as a supernatural being. Only the city remains uncaptured, but it is mine whenever I choose to take it. A god—a god—a god!"

Jim saw now what he had not realized before, that Tode was insane. It would, indeed, have been a miracle if he had been able to retain his sanity under such circumstances as he had described. His voice rose into a wild scream. Yes, Tode was mad—just such a madman as any of the old Roman emperors, drunk with power, each in his turn the sole ruler of the world.

"The Earth is mine!" Tode screamed. "Before the modern world was dreamed of, before the nations were created, Atlantis was the sole power that held dominion over the scattered tribes of mankind. And she is in my hand whenever I strike.

"Wealth incalculable, treasures such as man has never since seen, marvels of scientific discovery, flying machines that would make ours look foolish, paintings grander than have since been executed—all these things exist in the proud city that will shortly be at my command. And I have my Drilgoes, the inferior race, to serve me. They worship me because they know I am a god. Join me, Dent, and taste the joys of being one of the supreme rulers of the world."

In spite of his undoubted madness, there was such power in Tode's voice that Jim could not help believe what he had said.

"Well," snarled Tode. "You hesitate to give me your answer, Dent?"

"Lucille and I are engaged to be married," answered

Jim, and the words were drawn from his lips almost against his will. "We love each other. I am not going to lie to you and then betray you, Tode."

The expression on Tode's face was demoniacal. He snatched up the deadly tube that contained the violet fire and turned it upon Jim. Again Jim felt that repulsive force pushing him back. He gasped for breath, and tensed his whole body in supreme resistance, while he tried to grapple with Tode in vain.

But suddenly Tode dropped the tube, and a roar of laughter broke from his lips.

"You fool!" he shouted. "I tell you I am a god, the one god, supreme above all. Do you think to match your puny will against my own? I tell you Lucille is mine. And for ever, Dent. Whenever we two have reached old age, all that will be necessary for us to do will be to turn this screw a hair's breadth back into the past, and we are both young again. By holding this vessel steady in four-dimensional space, I can achieve immortality."

"Yes, Tode," answered Jim, "but, you see, that's the one thing that you haven't been able to work out yet."

The words seemed to come automatically from Jim's lips. It was only after he had spoken them that he realized they were true. For a moment Tode glared at him; then suddenly, with a shriek of insane rage, he leaped from the instrument board and swung the ray tube with all his might.

Jim felt the blow descend with stunning force upon his head. He reeled, flung out his arms, and toppled forward, unconscious....

Chapter 4: *Escape*

An intolerably bright light that seemed to sear his eyeballs was the first thing of which Jim was conscious. Then he became aware of his aching head, of a sense of utter lassitude, as if he had been bruised all over in some machine that had caught him up and held him in its grip for endless aeons.

At last, despite the pain in his eyes, he managed to

get his eyelids open. He tried to struggle to his feet, only to discover that he was firmly bound with what appeared to be tough creepers, pliant as ropes.

After the lapse of a few minutes, during which he struggled with the receding waves of unconsciousness, he came to a realization of his surroundings. That light that had so distressed him—though the effects were now beginning to pass off—was a pillar of smoke and flame, shooting out of the crater of a volcano about a mile away, across a valley.

He was lying in the entrance to a cave, pegged out on his back, and bound by the tough creepers to the stakes driven into the ground. Up to the mouth of the cave grew huge tree-ferns, cattails, cycads, and such growths as existed in earlier ages in the warm, moist regions of the world.

Beneath the level of the cave a heavy white fog completely shrouded the valley, extending up to within a short distance of the volcano opposite. But on the upper slopes of the volcano the sunlight played, making its crater a sheen of glassy lava,

intolerably bright.

Beyond the volcano Jim could see what looked like an expanse of ocean.

He groaned, and at the sound a creature came shambling forward, carrying what looked like a huge melon in either hand. Jim recognized the Drilgo, Cain.

Chattering and mumbling, Cain placed one of the fruits to Jim's mouth. It was a sort of bread-fruit, but he was too nauseated to eat, and rejected it with disgust. Cain offered him the second fruit.

It was a hollow gourd, the interior filled with a clear fluid. Jim drank greedily as the Drilgo put it to his lips. The contents were like water, but slightly acid. Jim felt refreshed. He looked about him.

The Drilgo uttered a chattering call, and immediately a host of the savages swarmed into the cave. Men—undoubtedly men, in spite of the brow ridges and the receding foreheads, carrying long spears, consisting of chipped and pointed heads of stone, with holes

bored in them, through which long bands of creepers passed, fastening them firmly to the shaft.

Chattering and gesticulating, the Drilgoes surrounded Jim as he lay helpless on the ground. Their savage faces, their rolling eyes, the threatening gestures that they made with their spears, convinced Jim that his end was a foregone conclusion.

But suddenly a distant rumbling sound was heard, increasing rapidly in volume. The floor of the cave vibrated; masses of rock dropped from the walls. The light of the volcano across the valley was suddenly obscured in an immense cloud of black smoke. The twilight within the cave was succeeded by almost impenetrable darkness.

Shrieking in terror, the Drilgoes bolted, while Jim lay straining at his ropes, expecting each moment to be crushed by the masses of rock that were falling all about him.

Suddenly a soft whisper came to Jim through the darkness: "Jim! Are you safe! Where are you? I can't

see you! Speak to me!"

It was Lucille's voice, and Jim called back, husky and tremulous in the sheer joy that had succeeded his anticipation of instant death.

Then he felt the girl kneeling at his side, and heard her hacking at his bonds. A whole minute passed before the stone knife was able to sever the last of the stout withes, however.

Then Jim was swaying on his feet, and Lucille's arms were about him, and for a few moments their fears were forgotten in the renewal of their love.

"I heard what that devil said to you last night," the girl said. "He means to kill you with awful tortures. He is away now, on some task or other, but he'll be back at any moment. We must get away at once—we three. Dad's in another cave not far away, and his guards bolted after the earthquake."

The earth was still rumbling, and the cavern still vibrating, but it was clear that there was no time to

lose. As soon as the quake subsided the Drilgoes would return. Guided by Lucille, Jim groped his way through the cavern. The girl called softly at intervals, and presently Jim heard old Parrish's answering call. Then the old man's form appeared in silhouette against the dark.

"I've got Jim," Lucille whispered. "Are you ready, dad?"

"Yes, yes, I'm ready," chattered the old man. "Now's our chance. I know a place where we can hide in the thick forests, where the Ray of the Atlanteans cannot penetrate the mists. Let's go! Let's go!"

Gripping hands, the three started back toward the point where a faint patch of darkness showed out the entrance to the cavern. They were nearing it when another and more violent shock flung them upon their faces.

Huge masses of rock came hurtling down from the roof and sides of the cavern, and again the three seemed to escape by a miracle.

Suddenly a huge shaft of fire shot from the crater opposite, evolving into an inverted cone that made the whole land dazzlingly bright. It pierced the mists in the valley underneath, and by that light Jim could see a great wave of lava streaming down the mountain sides, like soup spilled out of a bowl.

A gush of black smoke followed, and the light went out.

"Now!" gasped Parrish, and, clinging to one another, the three darted out of the cavern's entrance. Another terrific shock sent them stumbling and reeling and sprawling down the side of the mountain. Jim heard old Parrish wailing, and, as the shock subsided, groped his way to his side.

"You hurt?" he shouted.

"Lucille, Lucille," moaned the old man. "She's dead! A big rock crushed her. I wish I was dead too."

Jim called Lucille's name frantically, and to his immense relief heard her crying faintly out of the

darkness. He rushed to her side and held her in his arms.

"Where are you hit, darling?"

"I'm—all right," she panted. "I was stunned for a moment. I—can—go on now."

But she went limp in Jim's arms, and Jim picked her up and stood irresolute, until he heard Parrish shambling toward him over the heaving ground.

"She's not hurt, I think, only fainted," said Jim. "Which way, Parrish? You lead us."

"Down the slope," panted Parrish. "We'll be in the ferns in a minute. We can hide there for a while, till she's able to walk. God help us all! And I was once Professor of Physical Chemistry at Columbia!"

The outcry might have seemed comical under other circumstances; as it was, Jim heartily re-echoed old Parrish's sentiments in his heart.

The last shock was subsiding in faint earth tremors. The two men plunged down into the heavy fog, which quickly covered them, Jim carrying Lucille in his arms. He felt the ferny undergrowth all about him, the thick boles of tree-ferns emerged out of the mist.

"We can stop here for a while," panted Parrish.

"Crouch down! They'll never find us in this fog, and in a few minutes, when Lucille's better, we can go on."

You must tell me where we are and what our chances are," said Jim, after again ascertaining that Lucille was unharmed.

"I'll tell you, Dent, as quick as I can. It's the place where I've spent five years of hell as the slave of that devil, Tode. I never dreamed, when we were working on the old Atom Smasher, that he had adapted it to travel in the fourth dimension. He's taken us back twelve thousand years or so to the island of Atlantis. History hasn't begun yet. Atlantis is the only civilization in the world. The rest are Drilgoes, Neanderthal men, wandering in the forests, and still in their stone age.

"It's true, Dent, what old Plato learned from the Egyptian priests. Atlantis has been slowly sinking for thousands of years, and all that's left now is the one great island that we're on. Nearly all the Atlanteans, the Cro-Magnon men, have perished, except for a few who have crossed in ships to the coasts of France and Spain. They'll be the founders of modern Europe—Basques and Iberians, and Bretons and Welshmen. Our ancestors! It makes my brain reel to think of it!"

"Go on! Go on!" said Jim.

"There's a great city on the island, known as Atlantis too. As big as London or New York. With flying-machines and temples and art galleries and big ships that they're building to carry them away when the next subsidence comes. They know they're doomed, for every few days there's an eruption now.

"Tode means to make himself master of Atlantis, and transport it into another epoch by means of the Atom Smasher. But he's never managed to enter. He's made himself a god in the eyes of the Drilgoes, the savages who inhabit these forests. He's planning to lead them

against the city, and he's got an army of thousands from all parts of the interior, who worship him as divine.

"The Atlanteans are unwarlike. They've forgotten how to fight in their thousands of years of peace. But they've got a Ray ten times as strong as Tode's, that brings instant death to everything it touches. It shrivels it up. It's a different principle. I don't understand it, but it's this Ray that keeps the Drilgoes from capturing the city.

"Tode's got a laboratory inside the cave, fitted up with apparatus that he brought from Chicago, the world capital of the year 3000 A. D., after disintegrating the atoms and recombining them. But he hasn't succeeded altogether. He hasn't learned everything. The future isn't quite clear, like the past. There's a dark cloud moves across the spectral lines and blurs them. I think it's the element of free will—or God!"

"I know," Jim answered. "He can't hold that boat steady in four-dimensional space, as he pretends he can. If he could, it would mean that man was wholly

master of his destiny. He can't and he never will.

"There's an unknown quantity comes in, Parrish. It is God, and that's what's going to beat him in the end."

"I've not been as idle as Tode thinks," said Parrish, with a senile leer. "I know more about the Atom Smasher than he dreams of. He thinks me just an old fool, the remnants of whose brains are useful to him in his laboratory. That's why he's kept me alive so far. He'll find out his mistake," he chuckled. "I have something Tode doesn't dream of."

Suddenly Parrish's air of intense seriousness vanished. He chuckled and fumbled in his rags. Jim felt a small object like a lever pressed into his hand and then withdrawn.

"It's death, Dent," chuckled old Parrish. "The concentrated essence of the destructive principle. It's a lever I fitted into a concealed groove in the Atom Smasher unknown to Tode. This lever has a universal joint and connects with a hidden chamber, and when pulled will catapult the annihilated components of a

small quantity of uranium in any direction we desire. The release of the slumbering energy of this uranium will produce an explosion of proportions beyond the wildest dreams of engineers—perhaps, one great enough to throw the Earth out of its orbit!"

"Uranium!... Breaking up its components!" gasped Jim. "You mean you can actually do that?"

"Yes!" chuckled Parrish. "I'm keeping it for the day when Tode becomes a god. When he's steadied the boat in time-space and halted the march of the past, and when he's got Lucille—then, Dent, I shall so pull the lever that it will release the energy straight at Tode—and destroy the Atom-Smasher, ourselves, and even, perhaps, the whole Earth!"

And he burst into a peal of such wild laughter that Jim realized the old man's wits were gone.

Was it true, that amazing story? It was difficult to know, and yet anything seemed possible in this amazing world into which Jim had suddenly been thrown.

The vast pall of smoke cast out by the volcano was beginning to subside. Slowly a spectral light began to filter through the valley. Through the fog Jim could see glimpses of the ferny undergrowth, the giant tree-ferns and cycads that towered aloft. It was like a picture of the earth when the mastodons, the grass-eaters and the meat-eaters disputed for its supremacy.

Jim bent over Lucille. He saw her stir, he heard her murmur his name. Suddenly she sat up, fixed her eyes on his, and shuddered.

"I'm all right, Jim. Let's go," she said. "I can walk now."

She staggered to her feet. Jim put out his hand to support her, but she shook her head. Jim touched old Parrish on the arm. He started and uttered a wild screech; then seemed to come to himself and rose.

But that screech of his was re-echoed from the mountainside above. Other voices took up the echoes. Lucille clutched at Jim in a frenzy of fear.

"The Drilgoes!" she whispered. "They're on our trail!"

Seizing old Parrish by the arm, Jim started to drag him into the recesses of the fern forest. Suddenly the bestial face of a Drilgo appeared.

A yell broke from the man's throat. The hairy arm shot back. Jim saw the stone tip of the long spear poised overhead. He leaped forward, delivering a blow in the man's midriff with all the strength of his right arm.

The Drilgo grunted and doubled forward, the spear falling from his hand. The heavy head of stone embedded itself in the soft ground, so that the spear remained upright. As the man collapsed he yelled at the top of his voice.

"This way! This way!" gibbered old Parrish, suddenly alert.

But now the undergrowth all about them was alive with Drilgoes. The three dodged and doubled like hunted hares. High overhead something began to

clack with a sound like that made by a woodpecker drilling a tree, but infinitely louder.

And out of the void above came Tode's voice, shouting commands to the Drilgoes in their own language.

Suddenly a column of fire shot up from the volcano, infusing the white mists with a reddish glare.

Overhead the three could see Tode. He was flying with a pair of mechanical wings strapped to his shoulders, not more than two hundred feet above them. With a shout of triumph he swooped down. In his hand was a small cylinder, about the mouth of which a phosphorescent violet light was beginning to play.

"I've got you, Dent," he screamed in triumph, hovering above the three, while the wings drummed and vibrated till they seemed the mere play of light and shadow about Tode's shoulders. "Halt, or I'll blast your body and soul to hell! Halt, or I'll kill *her*!"

The deadly tube was pointing steadily at Lucille's body as Tode hovered ten feet overhead, perfectly still

save for the whirring wings. The three stopped dead, and Tode, with a shout of triumph, began calling the Drilgoes, who swarmed forward out of the undergrowth.

Huge brown bodies, nude save for their skins of jungle-cat or serpent, they emerged, quickly forming a ring about the three prisoners. Tode fluttered to the ground.

"Fools, did you think you could escape that way?" he asked. "As for you, Dent. I'm going to convince you of the reality of four-dimensional space as you would not be convinced in the old days. Do you know what I'm going to do with you? I'm going to strip the skin from you with the ray, and take you into the anatomical room at Columbia University and leave you there as an exhibit, Dent!"

Tode grinned like a madman. But Jim was looking past him, at something that had suddenly appeared upon the far horizon.

It was a round disc of bluish white, a disc like the

moon, but slightly smaller, a disc that flickered as if it had an eyelid that was being winked repeatedly. Simultaneously screams broke from the throats of all the Drilgoes. They stampeded.

Tode whirled about and saw. With a curse he leaped into the air and whirred away.

Out of that disc a slender, blue-white beam shot suddenly, driving a pathway through the fog, and disclosing the dark depths of the valley.

"The Eye! The Eye!" screeched Parrish. "Down on the ground! Down! Down!"

He dropped, and Jim caught Lucille and flung himself headlong with her. To and fro overhead, but only a few feet above them, moved the searchlight. Shrieks broke from the Drilgoes' throats as they scattered through the jungle.

Everywhere that ray moved, trees and undergrowth simply disappeared. A bunch of Drilgoes, caught by it, were obliterated in an instant. Great gaps were left

through the undergrowth as the ray passed.

It faded as quickly as it had come, and instantly old Parrish was on his feet, dragging at his daughter.

"Now! Now!" he babbled, heading along one of the burned tracks through the undergrowth.

Jim seized Lucille and the two raced in the wake of old Parrish. Behind them they could hear the Drilgoes shouting, but a dense, impenetrable darkness was already beginning to settle down over the valley. They lost the track and went crashing through the ferns, on and on until all was silence about them.

Suddenly Parrish went down like a log. He lay breathing heavily, completely exhausted. When Jim spoke to him a feeble muttering was the only answer. Jim and Lucille dropped to the ground exhausted beside him.

Chapter 5: *The Eye of Atlantis*

For perhaps half an hour the three lay there, hearing

nothing. It seemed to be night, for the darkness was impenetrable, save for the lurid flashes of fire from the volcano. Parrish, who was slowly recovering his strength, was mumbling incessantly. It was with difficulty that Jim recalled him to a realization of his surroundings.

"Where is the city of Atlantis?" he asked him.

"Over there," mumbled Parrish. "Behind the volcano. Why do you ask me?"

"I'm thinking of going there."

"Eh? Going there? You're mad. The Eye will see you, the Eye that can see for a hundred miles. They'll turn the Ray on you. Nothing is too small for the Eye. And they watch night and day."

"The Eye is off now."

"It's never off. The Eye is dark. It grows white only when they are about to use the Ray. Perhaps the Eye is watching us now."

"Nevertheless," said Jim, "I think we would do well to try to enter the city. We can't live here in the jungle at the mercy of these Drilgoes."

"It is impossible to enter. All strangers are killed by the Atlanteans."

"Dad," interposed Lucille, "I think we'd better do what Jim suggests. One of us must decide."

"My idea is that you take us to some place where we can get a view of the city," said Jim. "Then we can make up our minds what to do. We've got to get somewhere out of this jungle."

Parrish rose to his feet, mumbling. "If we go round the base of the volcano we can see Atlantis," he said. "It's always light there. In the daytime they drive away the fogs by some means they've got, and at night they have an artificial sun. But we'll be killed, we'll all be killed."

Mumbling and muttering, he began groping his way through the undergrowth in the direction of the

volcano, whose flashes were again becoming more frequent, affording a means of directing their route. Obscure rumblings were again beginning to shake the earth. For an hour the three picked their way steadily upward through the ferns, until the ground became more open.

They were approaching the base of the volcano, whose side now towered above them, the upper part glassy with vitreous lava.

Suddenly Parrish, who was still leading, stopped and began to tremble with fear. Stepping to his side, Jim heard the low muttering of voices not far away.

Very cautiously he moved forward through the thin fern scrub, until the glow of burning embers caught his sight. He stopped, hearing the voices more distinctly, and again moved forward.

Three Drilgoes, huge, bestial men, and evidently an outpost, were squatting around the ashes, devouring something with noisy gusto.

Softly as Jim had moved, their acute ears had caught the sound of his footsteps. They rose, still holding what they were eating in their hands, and, grasping their stone spears, moved in three separate ways toward the edge of the clearing.

The man nearest Jim uttered a guttural exclamation and, after sniffing a moment, began to lope in his direction. Suddenly he stopped short, petrified with astonishment and fear at the sight of a man who, instinct told him, was neither Atlantean nor of his own kind.

Jim leaped, tackling him about the knees, and brought him heavily to the ground. As the Drilgo fell, the spear clattered from his hand, but from his snakeskin girdle he pulled a long, curved knife of chipped obsidian, sharp as a razor.

Jim grasped the Drilgo's wrist, but in a moment he saw that he was no match for the creature in strength. He drew back his right arm and delivered a punch to the solar plexus with all his strength.

As the Drilgo's hand grew limp he snatched away the knife. There was no helping what he did for the two others were close upon him.

A thrust, a slashing blow, and the Drilgo was weltering in his life-blood. A backward leap, and Jim evaded the flung spear by a hair's breadth.

Knife in hand he leaped forward, and, dodging in beneath the long shaft of the weapon, got in a slash that almost cut the Drilgo's body in two.

The third Drilgo, seeing his two companions in their death-throes, flung away his spear and fled with loud howls into the jungle.

Jim stepped back. Lucille and her father were already almost at his heels. "It's all right," he called. "Come this way!" He led them through the ferny growth in such a manner that they should not see the two dead bodies. Nevertheless, he felt that Lucille knew.

"Let's see what they were cooking," he said.

But again he turned quickly. He could not know for sure what flesh that was, roasting and scorching on the embers, and he had no desire to know. It might have been monkey, but ... he turned away, and as he did so, Parrish picked up several round objects that were lying a little distance away.

"These are good to eat," he said. "A sort of bread-fruit. I've lived on it for five years," he added with a sort of grotesque pathos.

They munched the fruit as they proceeded up the mountain, and found it satisfying. Parrish seemed more himself again, though he still muttered at intervals. Lucille clung closely to Jim as they proceeded.

They were treading on lava now, vitreous, and smooth as glass. It was impossible to proceed further in that direction. They turned their steps around the base in the direction of the sea.

After another hour, during which their way was lit by almost continuous lurid flashes from the crater, a

patch of illumination, apparently out at sea, began to become visible. A half hour more, and they were rounding the volcano's base, and suddenly it burst upon them, a stupendous spectacle that drew an exclamation of amazement from Jim's lips.

That low, flat background was the sea, the sound of whose breakers was faintly audible. Between sea and land ran a narrow, slender causeway, perhaps a mile in length. And beyond that, set on a small island, was the most splendid city that Jim could have imagined.

Like New York—very like New York, with its mighty towers, but more symmetrical, sloping upward from the sea toward a towering rampart at the heart of it, crowned with huge domes and minarets and serpentine ramps and mighty blocks of stone that must have sheltered as many occupants as New York's highest skyscrapers.

The whole was snow-white, and gleamed softly in an artificial light dispensed from an enormous artificial planet that seemed to hover above the ramparts.

"God!" whispered Jim in awe as he gazed at the great city.

"You cannot cross that causeway," whimpered old Parrish. "It's death to try. One sweep of the Ray will blot out every living thing."

"Hush! Listen!" came from Lucille's lips. "Something's moving down there!"

The distant murmur of voices, the indescribable "feel" of the proximity of other human beings told Jim that they were in imminent danger. He glanced about him. A little overhead was an outcrop of enormous boulders, standing up like a little fortress above the smooth lava.

"Get behind there!" Jim whispered.

They turned and ran, slipping and stumbling up the smooth slope. Reaching the boulders, they ensconced themselves hastily behind them. Jim peered out through a crevice between two of the largest stones. The sound of moving things became more audible.

Then, as a flash of flame shot from the crater overhead, Jim saw a black human horde creeping like an array of ants around the base of the mountain not far beneath.

Just like an army of warrior ants it seemed to flow onward, in perfect order. And in the midst of it a faint violet light began to be visible.

Parrish seized Jim's arm, shaking with terror. "You know what that is, Dent?" he whimpered.

"It's Tode's Drilgoes, moving for a night attack upon Atlantis," answered Jim. "And that thing in the middle is the Atom Smasher."

It seemed hours before the last of the serried ranks of Drilgoes had passed. By the light of a lurid flash from the volcano Jim could see the column winding toward the causeway. Then all was shrouded in impenetrable darkness, save for the snow-soft city upon the island.

"What are we going to do?" chattered old Parrish. "I wish I was back in Tode's cave. He gave me food and

let me help with his work sometimes. I'll die here.
We'll never get away. We'll never get anywhere."

"We're safer here than anywhere else," answered Jim.
"We'll have to stay till morning, or—God, look at that!"

Out of the ramparts of the city the round, blue-white disc of the Eye had suddenly disclosed itself. And simultaneously a violet flare shot up above the moving hosts of the Drilgoes in the middle of the causeway.

Out of the center of the Eye that blinding searchlight streamed. And the pillar of violet fire rose up to counter it, clove it in two, as a man cuts off the tentacle of a cuttlefish, and left it groping helplessly above the heads of the Drilgoes.

[Image description start: A black and white illustration showing the city of Atlantis in the distance, bright against the dark night sky, with the wide beam of the Eye of Atlantis shooting out over a bridge of land, hitting the ray of light shooting up out of the Atom-Smasher, while a crowd of people surrounds it. Image description end.]

To and fro wavered the blue-white beam, and like a protective wall the violet column spread and extended, till the air was interlaced with the play of the two colors. Streaks of white shot through streaks of purple and black neutral clouds twirled, swirling in ghostlike forms. It was a scene inconceivably beautiful, and it was impossible to realize what must be happening out there.

Men must be dying, withering like stubble in the blue-white flames, whenever they caught them. And yet, under that play of colors, Jim could see the vast host crawling forward to the assault.

He held his breath. It was sublime and terrible, and on the result of that conflict depended—what? What difference, when all this was forgotten history, antedating the written records of the human race?

[Image description start: A black and white illustration showing Dent, Lucille, and her father standing behind rocks, watching a bright light. Image description end.]

Then of a sudden the blue-white rays were seen to win. They were beating down the violet light. Like living fingers they pierced that protective wall, flinging it back, until only the tall central pillar remained. And then for the first time the sound of combat became audible.

A groan of despair, of defeat, of hopelessness. The black stream was recoiling, turning upon itself. In the vivid glare of the white light it could be seen dissolving, breaking into a thousand pieces, streaming back toward the land. And, as it broke, the blue-white light pursued, eating its way and blasting all it met. Atlantis had triumphed.

Another sound was audible. From the city it came, a whirring as of innumerable grasshoppers, increasing till it sounded once more like the tapping of innumerable woodpeckers. Suddenly the night broke into whirling balls of fire.

Lucille cried out. Jim leaped to his feet to see more clearly.

"It's men with wings," he cried. "Scores of them. They're hurling something at the Drilgoes!"

The clacking of the wing mechanism filled the air. Now the fugitives from the Drilgo host were streaming along the base of the mountain underneath, seeking the safety of the jungles, and

over them, riding them, harrying them, flew the Atlantean birdmen, hurling their fiery balls. And where the balls fell, conflagrations of cold fire seemed to start and run like mercury, and shrivel up everything they touched.

But the birdmen were not without casualties of their own. Here and there one could be seen to drop, and then the massed Drilgoes would turn savagely upon him with their stone-pointed spears. The fight was coming very close now. The savage cries of the Drilgoes filled the night.

A ball of fire broke hardly fifty yards away from where the three were crouching. A birdman fluttered down like a wounded hawk and lay a-sprawl just underneath the rampart of boulders. Jim surmounted them, ran down the slope of the mountainside, and bent over the dying man. He was hideously wounded by the thrust of a Drilgo spear—whether because the mechanism had failed, or because he had swooped too low, Jim could not determine. As Jim bent over him he looked up at him.

A youth in his teens, with the face and build of a Greek warrior, a worthy ancestor of European man. Jim looked at him and shuddered. "My grandfather four hundred generations removed," he thought.

Seeing that this was no Drilgo, with eyes widened by the anticipation of death, the Atlantean smiled, and died.

Jim detached the straps that held the wings to his shoulders and examined them. They were multi-hinged, built of innumerable layers of laminated wood, which seemed to have been subjected to some special treatment. In the base of each, just where it fitted to the curve of the shoulder-blade, a tiny light was burning.

Jim looped the straps about his arms and walked back to the rampart. Old Parrish saw him and screamed. Lucille cried out.

"I'm going to try to get the Atom Smasher," said Jim, pointing to the thin spire of violet flame that was still visible in the center of the causeway. "It's our only

chance. You must stay here. If I live, I'll return. If I don't return—"

But he knew that he must return. Nothing could kill him, because Lucille would be waiting for him behind that rampart of stones upon the bare, vitreous mountainside.

"I'm going to get the Atom Smasher," Jim repeated. "In these wings I'll be taken for Atlantean. I'll—bring it back." He spoke with faltering conviction. And yet there was nothing else to do. Everything depended upon his being able to bring back the Atom Smasher and take Lucille and her father away.

"I think you're right, Jim," answered Lucille. "We'll—wait here till you—come—back."

Her voice died away in a sob. Jim bent and kissed her. Then he began examining the mechanism of the wings. It did not appear difficult. A leather strap fastened around the body. Through this strap ran cords operated by levers upon the breast, and there was a knob in a groove that looked as if it controlled

the starting of the mechanism.

"I'll be back," said Jim.

And suddenly the Eye appeared again, and with it there sounded once more the whir of wings.

"Down!" shouted Jim.

He was too late. A score of birdmen shot out of the dark and hovered over them. Next moment they had descended to the ground. Lucille and Parrish were seized, and Jim, struggling furiously, quickly found himself equally helpless in their grasp.

The accents of the Atlanteans as they spoke to one another were soft and liquid, their faces were refined and gentle, but their strength was that of athletes. Jim saw Lucille and Parrish lifted into the air; next moment he himself was raised in the arms of one of the birdmen, who shot upward like an arrow and headed a course back toward the city, carrying Jim as if he had been as light as a child.

Chapter 6: *Human Sacrifice*

In a great open space, flanked by temples and colonnades, the flight had come to rest. There, under the soft artificial light that made the whole city as bright as day, Jim, Lucille, and her father were set down before a sort of rostrum, on which were gathered the dignitaries of the city.

Jim's hopes were rising fast, for between the Atlanteans and the savage Drilgoes there was as much difference as between a modern American and a blackfellow from the Australian bush. These men were civilized to a degree that even modern America has not attained.

Nowhere was there a speck of dirt to be seen. Vehicles moved soundlessly along the wide streets on either side of this central meeting-place, and the whole city was roofed with glass, through which could be seen the brilliant moon and stars—invisible from the mist-filled valley without.

Soft garments of white wool clothed men and women

alike, fashioned something like togas, but cut short at the knee, leaving the lower part of the leg bare and disclosing the sandaled feet. The hair was long and flowed about the shoulders. But what struck Jim most forcibly was the look of utter gentleness and benignity upon these faces.

"I guess we've fallen into pretty good hands after all," he whispered to Parrish.

But one of the dignitaries upon the platform, an elderly man with a face reminiscent of William Jennings Bryan in his inspired moments, was leaning forward out of his curved chair and addressing the old man, and, to Jim's astonishment, Parrish was answering.

But these were not the liquid accents of the Atlanteans. The words resembled the barking of a dog, and across Jim's brain there suddenly flashed the explanation. The dignitary was speaking in the tongue of the Drilgoes, which Parrish, of course, would have learned in his five years of captivity.

Suddenly Parrish turned to Jim. "He wants to know where we come from," he said. "I've told him from a far country. He thinks we're ambassadors from some of the parts of Europe that the Atlanteans who sailed away some years ago landed at. It's no use trying to explain—they don't seem to have succeeded in inventing an Atom Smasher for themselves."

Jim nodded, and the colloquy went on and on, while the Atlanteans listened with languid interest, their kind and smiling faces seeming to exude benignity. At length the session seemed to have ended.

Parrish wore a wide grin. "Everything's coming right, dear," he told Lucille. "The old chap says we are to be the guests of the city either for a night or for a week. It's something to do with the moon, and there seems to be a full moon to-night. Some quaint superstition or other. And then I guess we'll have a chance to get away in the Atom Smasher. I've learned something of the mechanism, and it won't be hard to operate it. We've fallen into good hands."

A squad of four soldiers or policemen, with shorter

robes and what looked like truncheons in their hands, made signs to the three to accompany them. Amid mutual bows, the city's guests filled into a small court-way, closed at the further end, on which a number of Atlanteans were standing.

While Jim was wondering what the next move was to be, to his astonishment the whole courtyard began to rise slowly up the walls of the tall buildings on either side.

"An elevator!" gasped Lucille. "Now I do feel that everything is coming out all right, Jim, dear."

Jim did not question the psychology of this. He pressed her hand tenderly. Already Tode and the past were becoming a bad dream.

"Did you say anything about the Atom Smasher, Parrish?" he asked.

"No, I thought it better not to," replied the old scientist. "You see, they know it only as a force that neutralizes the blue-white ray. Best not to let them

know we're sailing for home in it."

"I think that was wise," answered Jim, and just then the rising court-way came to a stop level with the top story of the great building at one side.

Smiling courteously, the guards invited the three to precede them inside an enormous hall, supported on pillars of gleaming stone resembling alabaster. In the center was a small, low table, triangular in shape, with three of the low, curved chairs. The guards invited the three to be seated.

Almost immediately smiling servitors brought in fruits on platters of porcelain, dishes of cooked vegetables, somewhat like the modern ones, but seasoned and flavored with delicious herbs. The staple dish was something like an oval banana, but infinitely more succulent. The three fell to and made a hearty meal, which was washed down with fine wines.

"We've certainly fallen into good hands," said Jim. "All we've got to do is to lie low, and look pleasant, and it won't be long before we get an opportunity to get

hold of the Atom Smasher."

The guards, seeing that they had finished their meal, smilingly invited them to accompany them through a huge bronze door at one end of the hall. It swung back, disclosing complete darkness.

Jim felt Lucille's hand upon his arm. The girl was hesitating, and for a moment Jim hesitated too, half afraid of a fall into emptiness. Then he heard the footsteps of the guards ahead, and went on.

It was eery, moving there with the sound of feet in front of them, and, apart from that, utter silence. Then Lucille uttered a little cry.

"Jim, do you feel something pushing you?" she asked.

"There is something—" Jim swung around, but some invisible force continued to propel him forward. He moved sidewise, and the force gently corrected him. The sound of footsteps had ceased.

"What is it, Jim?" cried the girl. "Help me!"

Something's got hold of me!"

Old Parrish was struggling close beside them. Jim panted as he wrestled with the force, but his efforts were absolutely futile. Slowly, as if slid on wires, he was propelled forward, until a cushion of air seemed to block his further progress.

Dark as it was, and silent, Jim had the consciousness of other human beings about him, of a vast, unseen multitude that was watching him.

Suddenly the droning of a chant began to fill the place, as if a priest were intoning hymns. As that chant rose and fell, voices all about took up the echoing refrain. Jim tried to reach Lucille, but he could move his arm only a few inches against that resilient force pressing in on all sides of him.

Then, in an instant, a blinding, stabbing light shot through his eyeballs. He heard Lucille scream, old Parrish yelp, and, with eyelids screwed tight against the intolerable glare, fought once more desperately and ineffectively to reach Lucille's side.

Slowly Jim managed to unscrew his eyes. He began to realize that he was standing in what appeared to be an enormous amphitheatre. But high up, upon a narrow tongue of flooring that ran like a bridge from one end to the other, with Lucille on his right and Parrish on his left. Nothing visible seemed to be restraining them, and yet they were as securely held as if fastened with tight chains.

Jim's brain reeled as he looked down. Imagine a bridge about half-way up an amphitheatre of a hundred stories, the ground beneath packed with human beings no larger than ants, the whole of the vast interior lined with them, tier above tier, faces and forms increasing from pismire size below to the dimensions of the human form upon a level, and, again, fading almost to pin-points at the summit of the vast building, where the soft glow of the artificial light filtered through the glass of the roof.

He clutched at the air, felt the soft pressure of the force that was restraining him, looked at Lucille, and saw her half-unconscious with fear, leaning against it, leaning against that soft, resilient, cushionlike,

invisible substance; looked at Parrish, whom the shock had thrown into a sort of semi-catalepsy—Parrish, mouthing and staring!

He looked forward to where the tongue of flooring ended. Here, upon a stage, flanked with huge carved figures, a group was gathered. At first he was unable to discern what was being enacted there, so brilliant was the light that glared overhead.

It was the Eye, a round disc perhaps ten feet in diameter, that all-seeing Eye of Atlantis that guarded the great city, but how it worked Jim was totally unable to discover. He saw, however, that it was blinking rapidly, the alternations being so swift that it was only just possible to be conscious of them. Perhaps the Eye was opening and closing ten times a second.

Jim strained his eyes to see what was taking place on the stage at the end of the tongue on which he stood. What was it? What were they doing there? And was that the captured Atom Smasher standing between what looked like grinning idols? A group of captured

Drilgoes near it?

A shrill scream from Lucille echoed through the vast amphitheatre. Her eye had seen what Jim's had not yet seen—something that had shocked her into complete unconsciousness.

A marble figure, she stood leaning against the invisible force that kept her on her feet, and in those open, staring eyes was a look of ineffable horror.

Jim could see clearly now, for the light from the Eye was slowly diminishing in brilliancy, or else his own eyes were growing more accustomed to it. Those carved figures, forming a semi-circle upon the platform were figures of gods, squat, huge forms seeming to emerge out of the blocks of rock from which they had been fashioned.

Hideous, gruesome carvings they were, resembling some futuristic sculpture of to-day, for the artist who had fashioned them had given hardly more than a hint of the finished representation. It was rather as if the masses of rock that had been transported there had

become vitalized, foreshadowing the dim yet awful beings that were some day to emerge from them.

Only the arms were clearly sculptured, and each of the half-dozen figures squatting upon its haunches in that semi-circle had four of them. Arms that protruded so as to form an interlacing network, and the fingers were long claws fashioned of some metal. Over the arms the shapeless heads beat down with a leering look, and from each mouth protruded a curved tongue.

A masterpiece of horror, that group, like the great stone figures of the Aztecs, or some of the hideous Indian gods. Seen under the glare of the Eye, they formed a background of horrible omen. In a flash it dawned upon Jim that these hideous figures might be gods of bloody sacrifice.

"That's why these people seem so gentle," he heard himself saying. "It's the—the contrast."

He pulled himself together. Again he tried to move towards Lucille, and again that invisible force

restrained him.

Yes, it was the captured Atom Smasher upon the platform, and those forms grouped in front of the dignitaries were captured Drilgoes, a dozen or so of them. And the concealed priest was droning a chant again. Every other sound was hushed, but from each square foot of the great amphitheatre a pair of eyes was watching.

A myriad of eyes turned upon the platform! What was going to happen next?

Suddenly the priest's voice died away, and simultaneously the three dignitaries, who seemed to be officiating priests, from their solemn gestures, stepped backward, passing beneath the protruding arms of the idols. There sounded the deep whir of some mechanism somewhere, and the same invisible force that had Jim and his two companions in its control suddenly began to agitate the captive Drilgoes.

It was shuffling them! It was forcing them into line,

pushing here and pulling there, in spite of the Drilgoes' terrified struggles. They writhed and twisted, groaning and clicking in abject terror as they wrestled with that unseen power, and all in vain. Slowly the foremost of the Drilgoes was propelled forward, inch by inch, until he stood immediately beneath the interlacing arms.

And what happened next filled Jim with sick horror and loathing. For of a sudden the arms began to move, the iron claws cut through the air—a shriek of terror and anguish broke from the Drilgo's mouth ... and he was no longer a man, but a clawed and pulped mass of human flesh!

"Aiah! Aiah! Aiah!" broke from the throats of the assembled multitude.

The weaving arms had stopped. From behind them an attendant was gathering up what had been the Drilgo in a basket. Then the mechanism had begun again, and again that shrill cry of the spectators was ringing in Jim's ears.

Louder still rose the shriek of old Parrish as he understood. Jim put forth all his strength in a mad effort to break free. A child would have had more chance in the grip of a giant. And each time the arms of the gods revolved, the unseen force pushed Jim, Lucille, and Parrish nearer the platform.

Now Jim understood. This horrible sacrifice was a part of the religion of the Atlanteans, and he, Lucille, and Parrish, were being reserved for the final spectacle.

And at the sight of Lucille beside him, stonily unconscious, and yet standing, and moving like a mechanical doll, in little forward jerks—at the sight of the girl, hardly six feet distant, and yet utterly beyond the touch of his finger-tips, Jim went mad. He would not shout; he closed his lips in pride of race, pride of that civilization that he had left twelve thousand years ahead of him. Not like the shrieking Drilgoes on the platform, howling as each of them in turn was forced into that maze of revolving knives. But he fought as a madman fights. He hammered at the resilient air, while the sweat ran down his face, he braced his feet

upon the wooden tongue, and sought to stay his forward progress. And all the while that infernal force moved him steadily onward.

He was on the platform now. He was traveling the same route that the Drilgoes had taken. The unseen force was shuffling him, Lucille, and Parrish, pushing and pulling them. And, despite Jim's efforts, it was Lucille who was first of the three ... and Jim second ... and old Parrish third....

Jim heard Parrish's hoarse whisper behind him, "Death! Death! The uranium!" He was fumbling at his breast, but the significance of the words and gestures escaped him. He was staring ahead. Only three living Drilgoes of the whole number of prisoners remained alive, and suddenly it was borne in upon Jim that he knew the last of the three.

It was the Drilgo, Cain, who had been their companion in the Atom Smasher—there, not a dozen feet distant. Cain, his bestial face, with the ridged eyebrows and great jaws convulsed with terror and dripping sweat. Cain, immediately in front of Lucille.

"God, let her not wake! Let her never know!" Jim breathed. The agony would be but momentary. And there was nothing a man could not endure if he must. He could even endure to see Lucille become—what the Drilgoes had become. It would soon be over now.

The Eye was blinking overhead. The hideous stone faces of the Atlantean gods looked down in leering mockery. Another of the Drilgoes had gone the same route as the others. Cain was the second now, Lucille the third victim, and he, Jim, would be the fourth.

Gritting his teeth, Jim saw the next Drilgo propelled forward into the whirling knives. He saw the man fling up his arms, as if to shield his head—and then he was a man no longer, and the horrible knives revolved, and "Aiah! Aiah! Aiah!" cried the multitude.

Once more the mechanism whirred.... Once more the arms revolved. A howl of terror broke from Cain's lips as he was propelled onward....

Then suddenly the whirring stopped. The arms of the stone gods, with their hooked, razorlike claws, to

which clung particles of flesh, were arrested in mid-air. Cain, unharmed, was leaning backward, his features set in a mask of awful fear.

Simultaneously Jim knew that the force which had held him in thrall was gone. He flung his arms out. He was free. He grasped Lucille, held her tightly against his breast, stood there drawing great, labored breaths, waiting—for what?

A film was creeping over his eyes, but he was aware that the Eye had suddenly gone out. And out of the dark the priest was chanting.

Then came a deep-drawn sigh from the spectators, followed by a ringing shout. In place of the Eye the full moon appeared, sailing overhead. And, holding off that deathly weakness, Jim understood. The sacrifice had ended; a new month had begun....

Chapter 7: *Back to Long Island*

Jim, seated beside Lucille, was listening to Cain's gruntings and chucklings as he expounded the

situation to old Parrish.

It was the day following the scene in the amphitheatre. The four had been escorted back along the tongue of flooring into a hall with walls of fretted stone and sumptuous colorings. The floor was strewn with rich rugs woven of some vegetable fibre. There were divans and low chairs. At brief intervals, servitors, always smiling, passed carrying trays with wines and foods. And in the corridors were always glimpses of the guards.

"It was the rising of the full moon saved our lives, Dent," Parrish explained. "It appears they have this sacrifice at each of the moon's phases. The victims, captives or criminals, are eaten by the priests. We've got a week's respite, Dent, and then—God help us."

Jim's arm tightened about Lucille, but the girl turned and smiled into his face. There was no longer any fear there. And Jim swore to himself that he would yet find some way of outwitting their devilish captors.

"What the devil are we supposed to be, criminals or

what?" he asked her father. "Why do they smile at us all the time in that confounded way?"

Parrish questioned the Drilgo, but apparently he was unable to explain himself to him. "Maybe they think it an honor for us, Dent," he answered, "or maybe it's their idea of etiquette. Anyway, we four are to head the list when the moon's at the three-quarters. God, if only we could reach the Atom Smasher, I'm certain I could find out how it works!"

Jim had tried more than once to reach it. Through the colonnades at the end of the hall he could see the mechanism standing on the platform, always being inspected by half a dozen or so of the dignitaries of Atlantis. But all his attempts to cross that tongue of flooring had been vetoed by the guards.

They had presented their hands to him, palms outward, and on the palms were fine steel points, about two inches long, set into leather gauntlets. It had been impossible to try conclusions with them.

Two days went by. Once a group of dignitaries had

entered the hall and, with smiles and profuse bows, inspected the prisoners. Then they had departed. And Jim had paced the floor, to and fro, thinking desperately.

There was no sort of weapon with which to hazard an attack. Jim knew that they were under the closest observation. He could only wait and hope. And if all else failed, he meant to hurl himself, with Lucille in his arms, off the tongue of floor into the depths below when their time came.

On the third morning, after a troubled sleep induced by very weariness, Jim was awakened by one of the guards, and started up to see one of the bowing dignitaries before him, and Parrish and Lucille sitting up among their rugs.

Bowing repeatedly, the smiling old man addressed some words to Jim, and then turned to Parrish.

"He says he wants you to show him the way the Atom Smasher works," said Parrish. "Now's our chance, Dent. He thinks it's simply an apparatus for

neutralizing the blue-white ray. Don't let him guess—"

"I won't let him guess," Jim answered. "Tell him we'll go and show him—"

"I've told him, and he says only you are to go. He's suspicious. Say something quickly, Dent."

"Tell him," said Jim, "that I must have my two assistants and the lady. Tell him I may also need the help of some of his people. It requires many men to operate the machine."

Parrish translated, speaking in the Drilgo tongue, which was their only means of communication. The Atlantean considered. Then he spoke again.

"He says that we three men may go, but Lucille must be left behind," groaned Parrish.

"The answer is no," said Jim.

The old dignitary, who seemed somewhat crestfallen, departed with an expressive gesture. Jim and Parrish

looked at each other.

"That's our end," groaned Parrish.

"No, he'll bite," answered Jim, with the first grin that had appeared on his countenance since their arrival.

"Let's make our plans quickly. We must contrive to get Lucille inside the machine, under the pretense of assisting with the mechanism. And Cain, of course," he added, glancing at the goggly-eyed Drilgo. "You do your best to locate the starting mechanism, Parrish, and signal me the moment you're ready. We'll both leap in, and the four of us will sail—God, I don't care where we sail to, so long as we get away from here! Into eternity, if need be. But I hope it's Long Island!"

Back came the dignitary with two of the guards. Smiling at Jim, he indicated by signs that the three others might accompany him. The Atlanteans had bitten, as Jim had forecast.

The four proceeded along the hall and over the tongue of flooring. This time the force that had previously controlled their movements was not in

action. At the farther end of the bridge they saw the group of dignitaries gathered about the Atom Smasher, examining it curiously. Over their heads the hooked arms of the hideous gods were raised. The Eye was darkened, as if with a curtain, and through the glass roof, high overhead, the sunlight streamed down upon the empty amphitheatre.

In spite of their smiles, the dignitaries of Atlantis were very much on the alert, as their tense attitudes denoted. Two more guards had appeared, and Jim saw that they were uncovering some apparatus at the base of the Eye. They were swinging a camera-like object toward him, its lens focused upon the Atom Smasher. It was not difficult to understand what was in the minds of the Atlanteans. The dignitaries were uneasy and mistrustful, and at the first suspicion of treachery they meant to loose the blue-white Ray contained in the apparatus, and blow the Atom Smasher and the group about it to destruction.

Jim intercepted a sign from Parrish, indicating that he was to make pretense of assisting him. He bent over the machine, Lucille beside him. Parrish was busily

examining the wheels and levers. He was adjusting the thumbscrews, moving the needles along the dials.

One of the Atlanteans spoke, and Cain translated into "Drilgo" for Parrish's benefit. Parrish answered. Then, without raising his head, the old man said quietly, "I've located the starting lever, Dent. You and Lucille get inside quickly and pretend you're doing something to the machinery."

They stepped over the bow of the boat and stood beside Parrish, who continued examining the wheels. "We mustn't forget Cain," whispered the girl to her father. "Oh, I hope he understands!"

But there was no direct evidence that Cain did understand, and Parrish dared not warn him in "Drilgo," for fear one of the Atlanteans might understand the language. Cain was standing close beside the boat. But he was not in the boat.

Again one of the Atlanteans shot a question at Parrish. Parrish beckoned to Cain, and awaited the translation. He answered.

Each moment was growing tenser. It was impossible that the Atlanteans could fail to understand what was being planned. The only saving chance was that they did not realize the possibilities of escape that the vessel offered. A full minute went by.

Suddenly Parrish raised his head. "I've got it fixed, I think, Dent," he said. "I'm going to count. When I reach 'three,' seize Cain and pull him aboard."

Jim nodded. The uneasiness was increasing. The guards at the camera-like object were each holding some sort of mechanical accessory in their hands. It looked like a small sphere of glass, and it connected with the apparatus by means of a hollow tube of fibre. Jim guessed that in an instant the Ray could be made to dart out of the lens. It would be quick work—as nearly as possible instantaneous work.

"Ready, Dent?" asked Parrish in an even voice. In this crisis the old man had become astonishingly calm. He seemed the calmest of the lot. "One!"

Jim beckoned to Cain, who came toward him, his eyes

goggling in inquiry.

"Two!"

Jim reached out and took Cain by the arm. There was a sharp question from the Atlantean who had spoken before.

"Three!"

With all his force Jim yanked Cain over the edge of the boat. The Drilgo stumbled and fell headlong with a howl of terror. But headlong—inside.

What happened was practically instantaneous. A sudden whir of the mechanism, a violet glow from the funnel, the smell of chlorine—a flash of blinding blue-white light. The Atlantean guards had fired—a quarter-second too late!

The thump, thump of the electrical discharge died away. The four were in the boat, whirling away through space. Cain was rising to his knees, a woe-begone expression on his face. And there was a clean

cut, with charred, black edges along one side of the boat, showing how near the Atlanteans had come to success.

The relief, after the hideous suspense of the past days, was almost too much for the three white people. "We're free, we're going back home!" cried Jim exultantly, as he caught Lucille in his arms. And she surrendered her lips to his, while the tears streamed down her cheeks. Old Parrish, at the instrument board, looked up, smiling and chuckling. Even Cain, understanding that they were not to be hacked to bits with knives, gurgled and grinned all over his black face.

"How long will it take us to get back?" Jim asked Parrish after a while.

"I—I'm not quite sure, my boy," the old man replied. "You see—I haven't quite familiarized myself with the machine as yet."

"But we'll get back all right?" asked Jim.

"Well, we—we're headed in the right direction," answered Parrish. "You see, my boy, it's rather an intricate table of logarithmic calculations that that scoundrel has pasted on this board. The great danger appears to be that of coming within the orbit of the giant planet Jupiter. Of course, I'm trying to keep within the orbit of the Earth, but there is a danger of being deflected onto Pallas, Ceres, or one of the smaller asteroids, and finding ourselves upon a rock in space."

Jim and Lucille looked at Parrish in consternation. "But you don't have to leave the Earth, do you?" Jim asked.

"Unfortunately, it's pretty hard sticking to the Earth, my lad," said Parrish. "You see, Earth has moved a good many million miles through space since the time of Atlantis."

But both Jim and Lucille noticed that Parrish was already speaking of Atlantis as if it was in the past. They drew a hopeful augury from that. And then there was nothing to do but resign themselves to that

universal greyness—and to hope.

They noticed that Cain seemed to be watching Parrish's movements with unusual interest. The Neanderthal man seemed fascinated by the play of the dials, the whir of the wheels and gyroscopes.

"Are you setting a course, dad?" asked Lucille presently. "I mean, do you know just where we are?"

"To tell you the truth, my dear," answered her father, "I don't. I'm relying on some markings that Tode made on the chart—certain combinations of figures. God only knows where they'll take us to. But I'm hoping that by following them we shall find ourselves back on Long Island in the year 1930.

"No, that rascal could hardly have written down those figures to no purpose. They seem to me to comprise a course, both going and returning. But the calculations are very intricate, especially in the *time* dimension. I've nearly reached the last row now. Then, we shall have arrived, or—we sha'n't."

Jim and Lucille sat down again. There was nothing that they could do. But somehow their hopes of reaching Long Island in the year of grace 1930 had grown exceedingly slim. Everything depended upon whether or not Tode had meant those figures to represent the course back to the starting point or not.

A desperate hope—that was all that remained to them. They watched Parrish as his eyes wandered along the rows of figures, while his fingers moved the micrometer screws. And then he looked up.

"We're reaching the end of our course," he said.

"We're going to land somewhere. God knows where it will be. We must hope—that's all that's left us."

His hands dropped from the dials. He pressed a lever. The blur of nights and days began to slow. A column of vivid violet light shot from the funnel.

"Grip tight!" shouted Parrish.

Thump, thump! The Atom Smasher was vibrating violently. A jar threw Jim against Lucille. It was

coming to a standstill. Trees appeared. Jim uttered a shout. He stepped across to Parrish and wrung his hand. He put his arms about Lucille and kissed her.

They were back at the Vanishing Place, and all their sufferings seemed to be of the past....

Chapter 8: *A Fruitless Journey*

"Why don't you stop the boat, Parrish?"

"I'm trying to, lad!"

The Atom Smasher was still vibrating, even more violently than before. A column of violet light was pouring from her funnel. The pool, the mud, the walls of heaped up water were discernible, but all quivering and reproduced, line after line, to infinity. It was like looking into the rear-view mirror of a car that is vibrating rapidly. It was like one of those Cubist paintings of a woman descending the stairs, where one had to puzzle out which is the woman and which is the stairs.

A dreadful thought shot through Jim's mind. He remembered what he had said to Tode: "You can't hold the boat still in four-dimensional space."

This was not quite the same. By stopping the infernal mechanism, one re-entered three-dimensional space, and landed. Certainly the Atom Smasher could land. They were not like the motorcyclist who got on a machine for the first time, and rode to the admiration of all who saw him, except that he couldn't find out how to stop.

Yet there was Parrish still fumbling with the controls, and the boat was still vibrating at a terrific rate of speed. It is impossible to dream of leaping out, for there was no solidity, no continuity in the scenery outside.

It was not like attempting to leap from a moving train, for instance. In that case one knows that there is solid earth beneath, however hard one lands. Here everything was distorted, a sort of mirror reflection. And Jim noticed a strange thing that had never occurred to him before. Everything was reversed, as

in a mirror picture. That clump of trees, for instance, which should have been on the right, was on the left.

Parrish looked up. "There's some means of stopping her, of course," he said. "There must be a lever—but I don't know where to look for it in all this mess." He pointed to the revolving wheels. No, it might be a matter of days of experimenting in order to discover the elusive switch.

"It may be a combination of switches," said Parrish. "I don't know what we're going to do."

"Suppose I jumped and chanced it," Jim suggested.

Lucille caught his arm with a little cry. Parrish shook his head.

"That devil—Listen: there was a Drilgo he disliked. He threw him out of the boat just before she landed at the cave. Everything was in plain sight, plainer than things are here. But he was never seen again. For God's sake, lad, sit still. I'll try—"

Hours later Parrish was still trying. And gradually Jim and Lucille had ceased to hope.

Side by side they had sat, watching that glimmering scene about them. Sometimes everything receded into a blur, across which sunlight and shadow, and then moonlight raced, at others the surroundings were so clear that it almost seemed as if, by steadying the boat, they could leap ashore. And once there happened something that sent a thrill of cold fear through both of them.

For where the pool had been there appeared suddenly a hut—and Tode, standing in the doorway, looking about him, a malicious sneer curving his lips.

Jim leaped to his feet, and old Parrish, who had seen Tode too, sprang up in wild excitement.

"Sit down, lad," he shouted. "It's nothing. I—I turned the micrometer screw a trifle hard. I got us back to five years ago, when we were living here with Tode. That's just a picture—out of the past, Jim!"

Jim understood, but he sank down again with cold sweat bathing his forehead. The terrific powers of the Atom Smasher were unveiling themselves more and more each moment. Jim felt Lucille's hand on his arm. He looked into her face.

"Jim, darling, what's going to happen to us if dad can't find how to work the machine?"

"I don't know, dear. I've thought that we might all jump out and chance it. If we held each other tight, we'd probably land in the same place—"

Old Parrish stood up. "I can't work it, Jim," he said. "Tode's got us beat. There's only one thing for us to do. You can guess what it is."

"I think I can," said Jim, glancing askance at Lucille. Yes, he knew, but he lacked the heart to tell her. "If we were all to jump out, tied together—don't you think we might land—somewhere near where we want to land?" he asked.

"Jim, do you realize what each vibration of this boat

means?" asked Parrish. "There's a table on the instrument-board. It's a wave length of four thousand miles in space and nineteen years in time."

"You mean we're moving to London or San Francisco and back—"

"Further than that, every infinite fraction of a second," answered Parrish. "No, Jim, we—we wouldn't land. So we must just go back to where we came from, and—"

He had been speaking in a low voice, calculated not to reach Lucille's ears. The girl had been leaning back, her eyes closed, as if half asleep. Now she rose and stepped up to her father and lover. "You can tell me the truth," she said. "I'm not afraid."

"We've got to go back, Lucille," answered her father. "It's our only chance. By following the course in reverse we can expect to make Atlantis again—"

"Back to that horrible place?"

"No, my dear. The chart will lead us, obviously, back to the cave where Tode has his headquarters. We must try to surprise him, and force him to bring us back to Long Island."

"And then?" asked Lucille.

Parrish shrugged his shoulders. "We'll face that problem when we come to it," he answered.

"But how do you expect to be able to land at the other end any more than this?" asked Jim. "Suppose the machine continues to vibrate instead of coming to a standstill?"

"I think," said Parrish, "that we'll be able to strike a bargain with Tode. Obviously he will be willing to bring the machine to a standstill in order to parley with us. We'll make terms—the best we can. After all, he can't afford to remain marooned on the isle of Atlantis without the Atom Smasher."

"I hate the idea of bargaining with that wretch," said Lucille.

"So do we all, dear," answered Jim. "But there's nothing else that we can do. It's just a matter of give and take. And I'd be glad to consent to any terms that would bring us three safe back to earth, with all this business behind us."

"I'll start back, then," said Parrish, turning back to the instrument board.

And, to the familiar thump, thump of the electrical discharge, the Atom Smasher took up its backward journey once more.

A long time passed. With her head resting against Jim's breast, Lucille rested. Jim bent over her, trying to discover whether she was asleep or not. Her eyes were closed, her breathing so soft that she hardly seemed alive. An infinite pity for the girl filled Jim's heart, and, mingled with it, the intense determination to overcome the madman who had subjected her to these perils. He glanced across at Parrish, fingering his screws. Old Parrish looked up and nodded. There was a new determination in the old man's face that made him a different person from the crazed old man

whom Jim had encountered at the Vanishing Place.

"We can beat him, Parrish!" Jim called, and Parrish looked back and nodded again. "We're nearly back to the top of the column," he answered.

Not long afterward Parrish looked up once more.

"Stand by, Jim!" he called. "And be ready. Tode will be aware of our approach by means of the sensitive instruments he keeps in his laboratory. But don't harm him. We want him aboard, and we want him badly. He won't be able to play any more tricks with us. I've learned too much about the Atom Smasher."

He pressed a lever, and the greyness dissolved into its component parts of light and darkness. A jar. Thump, thump! The violet light! Lucille looked up, raised herself, uttered a low cry and caught at Jim's arm, trembling.

They had run their course truly. The Atom Smasher was vibrating outside the entrance to Tode's cave. And that was Tode, standing there, watching them, that devilish grin of his accentuated to the utmost. A

blurred figure that appeared and vanished, and a surrounding crowd of Drilgoes—how many it was impossible to guess, for they looked like a crowd of apes in motion.

Suddenly Tode disappeared, and a moment later Lucille uttered a terrified cry as his voice spoke in her ear:

"I thought you'd be back. I knew you'd got away from Atlantis when my recorder showed the waves of electrical energy proceeding from the city. You were clever, Dent, but you see, you had to come back to me to get my help."

"Don't be afraid, dear," said Jim, trying to soothe the girl. "That's a wireless receiving apparatus." He pointed to a sort of cabinet enclosed among the rotating wheels, and then it was evident that Tode's voice was proceeding from it.

Tode's figure appeared again, dancing through a haze of lines and patches. He was holding something in his hand which Jim made out to be the mouthpiece of a

microphone. The voice inside the Atom Smasher spoke again:

"Turn all the micrometer screws until the needles register zero, Parrish. Then turn Dial D to point 3, Dial C to 5, Dial B to 1, and Dial A to 2. I'll repeat.... Now press the starting lever, Parrish, and you'll find yourself on firm ground again."

A few moments later the Atom Smasher was pouring out an immense column of the violet light, and slowly the vibration ceased. The blurred forms of Tode, of the Drilgoes grew clear. They had arrived.

Tode stepped over the rail. "And now, my friends, we'll have a talk," he said.

"No tricks, Tode," Jim warned him, "You've probably got a number of deviltries up your sleeve—"

"One or two, Dent," grinned Tode.

"We're willing to negotiate."

"Of course you are. You see, I hold the trumps, Dent. Those dial deflections, which are inevitable in the construction of any piece of mechanism, are not the same for Earth in 1920. Don't think you can use the same figures to land with. You must remember that there has been a precession of the equinoxes since the time of Atlantis, with a consequent shift in the earth's axis. No, Dent, I've got you very much where I want you. But I'm willing to discuss terms with you. First of all, let's get rid of this useless cargo. I don't believe in overburdening a ship," he grinned.

He picked up Cain bodily and heaved the astonished Drilgo over the side before he knew what was happening to him. Cain picked himself up and rubbed his sides, whimpering mournfully. The Drilgoes crowded closer, their faces agape with astonishment. Tode spoke a command sharply, and they scattered.

"Before we come to terms, Dent, I'll give you a piece of news that may interest you," said Tode. "Much has happened during the time you've been away. Ambassadors have been out to see me from Atlantis. With the aid of a Drilgo interpreter, they conveyed to

me that they had been greatly impressed by the disappearance of the Atom Smasher. They have nothing like it, of course, and they think I'm a Number One magician.

"The upshot is, they want me to accept the supreme rule of the city, and use my arts to restore the lost territory that has sunk beneath the waves. They swore on an image of their god, Cruk, that they were sincere. I told them that I'd sent the Atom Smasher away on a journey, but that it would be back shortly, and that I'd then give them their answer.

"Now, Dent"—Tode's face took on that look of fanaticism that Jim had seen on it before—"I'm going to repeat the proposition I made to you before. Join me. I'll make you my chief subordinate, and I'll load you and Parrish down with honors. Everything that a human being can desire shall be yours. And in a year or two, when we're tired of being gods, we'll take the Atom Smasher back to Earth and destroy it, and with our wealth we'll become the supreme rulers of Earth too. I need you, Dent. You don't realize how lonely life can be when one is worshiped as a god. As for Lucille,

there are a thousand maidens more beautiful than she is, in Atlantis. Come, Dent, your answer! Your last chance, Dent! Don't throw it away!"

He read the answer before Jim could speak it. Jim saw Tode's face flicker, and hurled himself upon him. Lucille screamed. The two men wrestled together in the narrow confines of the circular boat. Jim struck Tode a blow that sent him reeling against the rail. Then he felt himself seized from behind. A giant Drilgo had him in his arms. He lifted him over the side and flung him to the earth. In an instant the chattering Drilgoes were crowding down upon him.

Struggling madly, Jim saw Tode fell old Parrish with a blow, push back Lucille as she sprang at him, and quickly press the starting lever. The column of violet fire faded, there came the whir of the mechanism—the Atom Smasher vanished....

Chapter 9: *The Blinded Eye*

Jim fought with all his strength; he managed to shake off his assailants and regain his feet. Then one of the

Drilgoes poised his stone-tipped spear, ready to hurl it through his body.

But the spear never left the Drilgo's hand in Jim's direction. Like a great black ape, Cain leaped upon the fellow and bore him to the ground, his feet twined around his shoulders, his hands gripping his throat. Not until the Drilgo had been reduced to a heaving, half-strangled hulk did Cain leave him.

Then Cain, bending until his stomach almost touched the ground, came worming toward Jim, making signs of obeisance.

What had happened that Jim had won the Drilgo's faith? Why did Cain now look upon him, apparently, as his master? It was impossible to gauge the processes of the black man's mind, and at the moment Jim was in no mood to wonder. The stunning disaster that had overtaken him monopolized his thoughts.

Lucille and Parrish were once more in Tode's power. That was the dominating fact. The only gleam of comfort in the situation was that Tode had given him

the clue to his movements.

Beyond a doubt Tode had taken his captives into Atlantis with him. It was impossible to disbelieve Tode's statement that he had been offered the supreme power in the city. Tode's egotism would have compelled him to blurt out that fact. Besides, Tode had certainly not gone back to earth.

Jim must force his way into Atlantis. He would find and rescue the two prisoners or die there.

He turned away from the groveling Cain and the chattering Drilgoes, who, inspired by Cain's example, now seemed animated by the same instinct to obey him, and went into the cave. But at the entrance he turned for a moment and looked back.

It was night. The valley was swathed in mists, the volcano opposite was spouting a shaft of lurid fire. On the water was a path of moonlight, where the clouds had been dispersed by the Atlanteans. Jim took in the scene, he raised one arm and shook his fist. Then, without a word, he passed inside.

There was a soft light in the cave, streaming out from an inner chamber, access to which was through a narrow orifice in the rock. Jim passed through, and found himself in Tode's laboratory.

He was astonished at its completeness, still more so at the existence of numerous pieces of apparatus whose purpose it was difficult to understand. There was a radio transmitter and receiver, but improved out of all recognition from those in use in the prosaic year 1930. Three or four tiny dynamos, little more than toys in appearance, were generating as much voltage, from the indicators, as a modern power station. And overhead was a dial, with two series of figures in black and red, and two needles, both of which were swinging briskly, indicating that there was an intense electrical disturbance in the vicinity.

The Atom Smasher! Jim took heart. Tode could not be far away! He looked about him, subconsciously trying to discover some implement that would prove of service to him, but there was nothing that he could see, not even one of the ray tubes. He looked about uneasily.

Then his eyes fell upon something so singularly out of place that it looked, for the moment, like some pre-historic weapon. It was the last thing Jim would have expected to find there—nothing more nor less than a sporting rifle!

Deer shooting had been one of Tode's pastimes in the old days, and more than one fat buck had been surreptitiously shot for the benefit of the larder at the Vanishing Place. There was something almost pathetic in the sight of that rifle and the fifty cartridges in their cardboard carton. Perhaps Tode had pictured himself shooting big game in Atlantis at some period or other. It was a human weakness that for an instant lessened Jim's hate and horror of the man. It brought him to a saner view of the situation. Jim had been on the point of losing his powers of reason. The sight of the rifle restored them.

He turned sharply as he heard a sound in the entrance. Cain was coming toward him, with many genuflexions, and much stomach wriggling. He stopped, straightened himself. There was a look of singular intelligence on the Drilgo's face.

He began chattering, pointing in the direction of Atlantis. Jim could make nothing of what he was trying to convey.

"Yes, they're there," he said bitterly, "but I don't see how that's going to help me."

"Oh my poor Lucille!" said Cain unexpectedly.

The words were like a parrot's speech, the intonation so remarkable a copy of old Parrish's that Jim was flabbergasted. Nevertheless it was evident that Cain knew he was referring to Lucille.

With a strange, slinking motion he crossed the laboratory and bent beneath a huge slab of stone, resting on two great hewn rocks. He emerged, holding in his arms two curious contrivances. He laid them at Jim's feet.

Jim stared at them, and suddenly understood what they were. They were two pairs of wings, of the kind the Atlanteans had used when they made their aerial sortie against the Drilgoes.

Cain picked up one pair and began adjusting it about his body. He made fluttering movements with his arms.

"You mean that you've learned how to fly, you black imp of Satan?" shouted Jim.

And Cain, as if understanding, nodded and beamed all over his black face.

With that Jim's idea was born. If the Drilgoes would follow him, he would lead them against Atlantis. And, before the assault began, he would fly to the great Eye that guarded it, and blind it.

He thought afterward that it was like a supernatural revelation, this scheme, that leaped full-fledged into his brain. And Cain had developed extraordinary executive ability. Outside the cave, through rifts in the swirls of fog, Jim could see innumerable Drilgoes massing in the valley, as if they understood Jim's purpose. From Cain's gesticulations, and the number of times he rubbed his stomach, it was evident that he counted upon sacking Atlantis and was imagining

innumerable meals of fat captives.

Each flash of lurid light from the volcano disclosed further masses of Drilgoes, armed with their stone spears, apparently assembling for the attack.

Whether Tode had summoned them before the Atlanteans offered him the rulership of the city, or whether Jim's own plan had been communicated to them by some telepathic process, it was impossible to guess, but there was not the least doubt but that they were prepared to follow him.

Cain nudged Jim and began strapping the other pair of wings about his body. Jim saw that the energy was supplied by two tiny, lights burning in the base, cold fire, stored energy whose strength he did not guess. For, when Cain took him by the hand, and motioned to him to slide the knob in the groove, he was hurled skyward like a rocket.

There followed a delirious hour. Tossing and tumbling like a pigeon in a gale, Jim by degrees acquired mastery over the apparatus. At the end of the hour he could fly almost as well as Cain, who, like a black

guardian angel kept beside him, reaching out a hand when he overbalanced, and pulling him out of aerial side-slips.

Suddenly Cain motioned toward the volcano, and started toward it in a rocketlike swoop. Jim understood. The Drilgoes were ready for the attack upon Atlantis.

Jim dropped to earth, ran back into the cave, and picked up the rifle and the carton of ammunition. He filled the magazine, and, with the rifle on his arm, rose into the air again. Cain was circling back, uttering weird cries of distress at finding his master absent.

"It's all right, Cain," said Jim. "I'm here."

Side by side they flew steadily toward the base of the great cone, which was pouring out a fan-shaped stream of fire. Rumbblings shook the earth; it was evident that another upheaval was in course of preparation. The long column of the Drilgoes could be seen, extending around the flank of the mountain.

Then of a sudden the Eye opened. And across the causeway came the blue-white Ray, carrying death and destruction.

The Drilgoes, who had learned wisdom, remained concealed out of the Ray's path, and escaped, but a great dinosaur, fifty or sixty feet in length, startled by the light, came blundering out of the ferns, uttered a bellow, and melted into an amorphous mass. Birds dropped from their roosting places with a sound like that of falling hail. Black paths were cloven through the midst of the jungle.

Rifle in hand, Jim soared into the air, and shot forward, high above the causeway toward the glowing Eye.

He had noticed that the blue-white ray appeared in cycles of about two minutes, and had made his plans accordingly. Two minutes in which to accomplish his task, or take the chance of a hideous death. Some thirty seconds carried him right into the glowing heart of the winking Eye: he hovered and raised his rifle.

Underneath him the breakers thundered: round the Eye a myriad sea-birds fluttered, dashing themselves against it, falling into the waves. Huge and high the great city towered into the skies, lit by its soft incandescence. Jim could see the throngs in the streets, the traffic. But what was happening in the other side of the Eye?

Suddenly he saw the moon in her third quarter sailing through the skies, and a hideous fear overcame him. Suppose Tode had met with treachery; suppose that this very night Lucille were doomed to be sacrificed to the terrible god Cruk!

Suppose that even at that moment her tender flesh were being sacrificed by the awful hooks!

He drew a bead upon the Eye and fired—and missed. The bullet went wide. But even if it struck, what guarantee had he that it would shatter the glass, or whatever substance it was that covered the orb?

He lost position, and knew that the two-minute interval was drawing to a close. He soared and fired

again. The Eye still glowed.

Then of a sudden a blinding ray shot forth from it, so dazzling that it seemed to sear Jim's eyeballs. The interval was ended.

It shot beneath him, but no more than a few feet, and turning his eyes shoreward, Jim saw it sweep along the causeway and tear a black path through the forest. Frantically he soared, and circled around the temple.

The ray went out. Two minutes more. And now the temporary panic had passed; Jim's nerves grew steady as a rock. He eased the controls and floated in toward the glowing orb. Sea-mews, screaming, dashed themselves against it and fell, wounded and broken, into the breaking seas below. They fluttered past Jim's face, one impacted against his chest with a thud that rocked him where he hovered.

But Jim knew that he could not fail. At a distance of fifty feet he drew a bead upon the centre of the Eye and pressed the trigger.

And instantly the light went out....

Chapter 10: *The Fight in the Dark*

He dropped down softly to the causeway. Within the city he heard a sound such as he had never heard before, as if some ancient prophecy of doom had been fulfilled, a wailing "Aiah! Aiah! Aiah!" that was caught up from throat to throat and rose upon the wind in a clamor wild and mournful as that of the sea-birds around the broken Eye. It was the death-keening of proud Atlantis, Queen of the Atlantic for fifty thousand years. She was dying in darkness.

For, with the blinding of the Eye, all the soft lights within the city had gone out. Dense, utter, impenetrable darkness reigned, and even the gibbous moon, floating overhead, seemed to give no light.

Jim dropped to the causeway and began running in the direction of the city. But, feeling the drag of his wings, he unbuckled the strap and flung them away. He might need them, but his one thought was to get to Lucille, if she were still alive. And he felt that each

moment lost might mean that he would be too late.

Through the blackness he raced forward, hearing that sobbing ululation within the walls. But behind him he heard another sound, and shuddered at it, all his hopes suddenly reversed. For that sound was the shouting of the Drilgoes as they rushed forward to conquest. And now it seemed a monstrous thing that proud Atlantis should be at the mercy of these hordes. He had let loose destruction upon the world. But it was to save Lucille.

That was his consolation. Yet he hardly checked the racing thoughts within his mind even for a moment, to meditate on what he had done. Those thoughts were all of Lucille. He must get to her before the Drilgoes entered. And he ran faster, panting, gasping, till of a sudden the portals loomed before him, and he saw a crowd of frenzied Atlanteans struggling to pass through, and a file of soldiers struggling to keep them back.

He could distinguish nothing more than the confused struggle. He hurled himself into the midst of the

crowd and swept it back. He was within the walls now, and struggling to pass through the mob of people that was swarming like homeless bees.

He fought them with flailing fists, he clove a pathway through them, until he found himself in a great shadowy space that he recognized as the central assembly of the city. More by instinct than design he hit upon the narrow court that was the elevator. But the court was filled with another mob of struggling people, and in the darkness there was no possibility of discovering the secret of raising it.

He blundered about, raging, forcing a path now here, now there. He ran into blind alleys, into small threading streets about the court, which led him back into the central place of assembly. It was like a nightmare, that blind search under the pale three-quarter moon and the black, star-blotched sky.

Suddenly Jim found himself wedged by the pressure of the crowd into a sort of recess leading off the elevator court. So strong was the pressure here that he was unable to move an inch. Wedged bolt upright,

he could only wait and let the frenzied mob stream past him. And louder above the sound of wailing came the roars of the Drilgoes swarming along the causeway.

Suddenly something gave behind him—a door, as it seemed, broken off its hinges by the mob pressure. Jim was hurled backward, and fell heavily down a flight of stone stairs, bringing up against a stone balustrade. He got up, unconscious of his bruises, ran to the top of the flight, and saw the dim square of palest twilight where the door had been.

But over him he could faintly see the stairs and the balustrade, winding away to what seemed immeasurable height. That stairway must lead to the top of the building, and thence there should be some access to the amphitheatre. Jim turned toward it.

Suddenly a tremendous uproar filled the streets, yells, the clicking grunts of the Drilgoes, the screams of the panic-stricken populace. The invaders had arrived, and they were sweeping all before them. No chance of recognition in that darkness. Lucille! Shouting her

name, Jim began to ascend the stairs in leaps of three at a time.

But long before he reached the top he was ascending one by one, with straining limbs and laboring breath. Red slaughter down below, a very inferno of sound; above, that shadowy stairway, still extending almost to the heavens. Step after step, flight beyond flight!

Jim's lungs were bursting, and his heart hammering as if it would break his chest. One flight more! One more! Another! Suddenly he realized that his task was ended. In place of the stairs stood a vast hall, and beyond that another hall, dim in the faint light that filtered through the glass above.

Jim thought he remembered where he was. Beyond that next hall there should be the tongue of flooring, crossing the amphitheatre and joining the platform of the idols. But he stopped suddenly as he emerged, not upon the tongue, but upon still another stairway.

He had gone astray, and out of his bursting lungs a cry of rage and despair went up. For a moment he

stood still. What use to proceed further?

And then, amazingly, there came what might have been a sign from heaven. Down through a small, square opening overhead, no larger than a ventilator, it came ... a glimmer of violet flame!

And Jim hurled himself like a madman against the stairs, and surmounted them with two bounds. There were no more. Instead, Jim found himself looking down into the amphitheatre.

The thick walls had cut off all sound from his ears, save a confused murmur, but now a hideous uproar assailed them. The whole floor of the amphitheatre was a mass of moving shadows, of slayers and slain.

The Drilgoes had broken in and trapped the multitudes that had taken refuge there. Their fearful stone-tipped spears thrust in and out, to the accompaniment of their savage howls and the screams of the dying.

Never has such a shadow-play been seen, perhaps, as

that below, where death stalked in dense darkness, and the slayer did not even see his victim. Only the thrust of spears, the soft, yielding flesh that they encountered, the scream, the wrench of stone from tissue, and the blended howl of triumph and scream of despair.

Yet only for a moment did Jim turn his eyes upon that sight. For he knew where he was now. He had emerged upon the other side of the amphitheatre, upon the platform where he had seen the priests and dignitaries gathered when he was led forward to be sacrificed.

There, in the rear, were the hideous, shadowy gods, looming up out of the darkness, their outstretched arms interlaced. And there upon the platform was the Atom Smasher, a little thread of violet light seeping out of the central tube.

Beside it stood a group of figures, impossible to distinguish in the darkness, but of a sudden Lucille's scream rang out above the din below.

With three leaps Jim was at her side. He saw the girl, Tode, and Parrish, struggling in the grasp of a dozen priests. They were dragging them toward the idols, and Jim understood what that scene portended.

In despair at the irruption of the Drilgoes, the priests were seeking to propitiate their gods by sacrificing the three strangers whom they held responsible for all their woes.

Jim caught Lucille in his arms, shouting her name. She knew him, turned toward him. Then one of the priests, armed with a great stone-headed club—for no metal is permitted within the precincts of the god Cruk—struck at him furiously.

Jim leaped aside, letting the club descend harmlessly upon the floor. He shot out his right with all his strength behind it, catching the priest upon the jaw, and the man crumpled.

Whirling the club around his head, he fought back the fanatics, all the while shouting to Tode to start the Atom Smasher. In such a moment he only

remembered that Tode was a white man, and of his own generation.

He struck down three of the priests; then he was seized around the knees from behind, and fell heavily. The club was wrenched from his hand. In another moment Jim found himself helpless in the grasp of the Atlanteans.

As he stopped struggling for a moment, to gather his strength for a supreme effort, he heard a whir overhead, and saw the arms of the stone gods begin their horrible revolution. The priests had started the machinery. And high above the din below rang out the wild chant of the high priest.

Jim saw him now, a figure poised upon a platform behind the arms, his own arms raised heavenward.

"Aiah! Aiah! Aiah!"

Jim was being dragged forward, with Lucille beside him, old Parrish following, still making a futile struggle for life, while pitiful screeches issued from

his mouth.

Jim saw the revolving arms descend within a foot of his head. One more fight—one more, the last.

Suddenly, with loud yells, a band of Drilgoes leaped forward from the head of the stairs and rushed upon the struggling priests and victims. And, dark as it was, Jim recognized their leader—Cain.

And Cain knew Lucille. As the priests rallied for a desperate resistance, Cain hurled his great body through the air, landing squarely upon the shoulders of the priest nearest the revolving arms, and knocking him flat.

Then the arms caught priest and Drilgo, and the steel hooks dug deep into their flesh. A screech of terror, a howl that reverberated through the amphitheatre, and nothing remained of either but a heap of macerated flesh.

But in that instant Jim had fought free again. He caught Lucille and dragged her back toward the Atom

Smasher.

Tode had already broken from his captors and was working at it frantically.

"Hold on!" screeched old Parrish. "Hold on!"

They had a moment's leeway. The Drilgoes had driven the priests back into the hooks. With awful shrieks the fanatics were yielding up their lives, in the place of their selected victims.

But more Drilgoes were pouring up the stairs. A moment's leeway, and no more, before the savage band would impale the four upon their stone-pointed spears. There was not the slightest chance that they would be able to make their identity known.

"For God's sake hurry!" Jim yelled in Tode's ear.

The wheels were revolving, a stream of violet light, leaping out of the central tunnel, cast a lurid illumination upon the scene.

But it was too late. A score of Drilgoes, with leveled spears, were rushing on the four.

"Hold tight!" screeched Parrish. He thrust his arm into his breast, and pulled out a little lever. Jim recognized it and remembered. It was the instrument of universal death—the uranium release of untold forces of cataclysmic depredation.

"Take that!" screamed the old man, inserting the lever into the secret groove in the Atom Smasher and jerking it in the direction of the priests.

Chapter 11: *Tode's Last Gamble*

A roar that seemed to rend the heavens followed. Roar upon roar, as the infinite momentum of the disintegrating uranium struck obstacle after obstacle. The Drilgoes vanished, the amphitheatre melted away, walls and roof.... Overhead were the moon and stars.

And proud Atlantis was sinking into the depths of the sea.... Not as a ship sinks, but piecemeal, her walls and towers crumbling and toppling as a child's sand-

castle crumbles under the attack of the lapping waves. Down they crashed, carrying their freight of black, clinging, human ants, while from the sea's depths a wave, a mile high, rose and battered the fragments to destruction. From the crater of the volcano a huge wave of fire fanned forward, and where fire and water met a cloud of steam rose up.

A boiling chaos in which water and earth and fire were blended, spread over land and sea. And then suddenly it was ended. Where the last island of the Atlantean continent had been, only the ocean was to be seen, placid beneath the stars.

The Atom Smasher was vibrating at tremendous speed. Jim, with one arm round Lucille, faced Tode at the instrument board. Near by sat Parrish, watching him too.

"That took a whole year," said Tode. "That pretty little scene of destruction we've just witnessed. The good old Atom Smasher has been doing some lively stunts, or we'd have been engulfed too. We're not likely to see anything so pretty in history again, unless we go

to watch the destruction of Herculaneum and Pompeii by lava from Vesuvius. But that would be quite tame in comparison with this."

Tode's jeering tone grated on Jim's ears immeasurably.

"I don't think any of us are craving any more experiments, Tode," he said, trying to keep his voice steady. "Suppose you take us back to Peconic Bay. We'll dump the Atom Smasher into the pond, and try to forget that we've had anything except a bad nightmare."

"Don't trust him, Jim," whispered Lucille.

Tode heard. "Thank you," he answered, scowling. "But seriously, Dent, we can't go back with nothing to show for all our trouble. Those fools tried to betray me, and then the Eye went out. Perhaps I have you to thank for that performance? However, the sensible thing is to let bygones be bygones. But we must make a little excursion. How about picking up a little treasure from the hoards of Solomon or Genghis Khan? A few

pounds of precious stones would make a world of difference in our social status when we reach Long Island."

Jim felt a cold fury permeating him. Tode saw his grim look and laughed malignantly.

"Well, Dent, I'm ready to be frank with you," he said. "The game's still in my hands. I want Lucille. I'm willing to take you and Parrish back, provided you agree she shall be mine. I'll have to trust you, but I shall have means of evening up if you play crooked."

"Why don't you ask my girl herself?" piped old Parrish.

"He needn't trouble. He knows the answer!" cried Lucille scornfully.

"There's your answer," said Jim. "Now, what's the alternative?"

"The alternative is, that I have already set the dial to eternity, Dent," grinned Tode. "Eternity in the fifth

dimension. Didn't know I'd worked that out, did you? A pleasant little surprise. No, don't try to move. My hand is on the lever. I have only to press it, and we're there."

Jim stood stock still in horror. Tode's voice rang true. He believed Tode had the power he claimed.

"Yes, the fifth dimension, and eternity," said Tode, "where time and space reel into functionlessness. Don't ask me what it's like there. I've never been there. But my impression of it is that it's a fairly good representation of the place popularly known as hell.

"You fool, Dent," Tode's voice rang out with vicious, snarling emphasis, "I gave you your chance to come in with me. Together we'd have made ourselves masters of Atlantis and brought back her plunder to our Twentieth Century world. You refused because of a girl—a girl, Dent, who loved me long before you came upon the scene."

"That's a lie, Lucius," answered Lucille steadily. "And you can do your worst. There's one factor you haven't

reckoned in your calculations, and that's called God."

"The dark blur on the spectral lines," old Parrish muttered.

Tode laughed uproariously. "Come, make your choice, Dent," he mocked. "It's merely to press this lever. You'll find yourself—well, we won't go into that. I don't know where you'll find yourself. You'll disappear. So shall I. But I'm desperate. I must have Lucille. Choose!" His voice rang out in maniac tones. "Choose, all of you!"

"Lucille has answered you," Jim retorted.

"And how about you, old man?" called Tode to Parrish.

Parrish leaped forward, making a swift movement with his hand. "Go to your own hell, you dev—"

A blinding light, a frantic oscillation of the Atom Smasher, a sense of death, awful and indescribable—and stark unconsciousness rushed over Jim. His last thought was that Lucille's arms were about him, and

that he was holding her. Nothing mattered, therefore, even though they two were plunged into that awful nothingness of the fifth dimension, where neither space nor time recognizably exists. Love could exist there.

Chapter 12: *Solid Earth*

"He's coming around, Lucille. Thank God for it!"

Jim opened his eyes. For a few moments he looked about him without understanding. Then the outlines of a room etched themselves against the clouded background. And in the foreground Lucille's face. The girl was bending over Jim, one hand soothing his forehead.

"Where am I?" Jim muttered.

"Back on earth, Jim, the good old earth, never again to leave it," answered Lucille, with a catch in her voice. With an effort she composed herself. "You mustn't talk," she said.

"But what place is this?"

"It's Andy Lumm's house. Now rest, and I'll explain everything later."

But the first explanation came from Andy Lumm.

"Well, Mr. Dent, my wife and me sure were glad to be on the spot when you and Miss Parrish got bogged on the edge of the Black Pool," he said. "Mean, treacherous place it is. Thar was a cow got mired thar last month, up to her belly. If us hadn't found her, and dragged her out with ropes, she'd have gone clear under. Granpop Dawes says thar's underground springs around the edge, and that it runs straight down to hell, though that seems sorter far-fetched to me.

"Yessir, and if I hadn't heard WNYC giving Miss Parrish on the list of missing persons, and as having been seen near here, I reckon I'd never have found you. Made me and my wife uneasy, that did. 'Andy,' she says. 'I got an inkling you oughter go to the Vanishing Place and see if she ain't there.' And there I found you two, mired to the waist, and Mr. Parrish

dancing around and fretting, and his clothes burned to cinders.

"It sure seems strange to me, to think Mr. Parrish got away safe after that explosion five years ago, and of his wandering around with loss of memory, till you found him, and brung him back here to restore it, but thar's strange things in the world—yes, sir, thar surely is!"

In the happiness of being back on Earth once more, Jim was content to let further explanations go. The return of Parrish had been duly chronicled in the newspapers, and had provoked a mild interest, but fortunately the public mind was so occupied at the moment with the trial of a night club hostess that, after the first rush of newspaper men, the three were left alone.

Day after day, in the brilliant autumn weather, Jim and Lucille would roam the tinted woods, recharging themselves with the feel of Earth, until the memory of those dread experiences grew dim.

"Well, Jim, I reckon I'd better tell you and get it over," said old Parrish one morning—Parrish, quite his old, jaunty self again. "Tode had got the dials pointing to the fifth dimension—eternity, he called it, though actually I believe it's nothing more than annihilation, a grand smash. Well, he pressed that lever. But something had gone wrong.

"You remember how poor Cain seemed to take great interest in the Atom Smasher. There's no way of telling what had been going on in that brain of his, but it looks to me like he'd known that that lever meant death. It was sealed up in wax, and Tode had got it free on the way out of Atlantis.

"Well—this it what I made out from examining the thing afterward. Cain had been monkeying with the lever. He'd pried loose one of the wires that hooked to the transformer, and short-circuited it, not knowing, of course, just what he was doing. The result was that when Tode pressed that lever, instead of blowing the whole contraption to pieces, he got a couple of billion volts of electricity through his body, combined with a larger amperage than has ever been imagined. It

burned him to a few grease spots. He simply—
vanished. You don't remember what you did at the
moment, boy?"

"I don't seem to remember anything," said Jim.

"Well, your response was an automatic one. You
jumped him. Luckily you were too late, for Tode
vanished like that!" Old Parrish snapped his fingers.

"But you must have got into the field of magnetic
force—any way, you were almost electrocuted. Lucille
and I thought you were dead for hours.

"We laid you down and set a course for home. I used
those dial numberings Tode had given me. He'd said
they wouldn't work, but he'd lied. They did work.
They brought us back to the Vanishing Place.

"We carried you out, and then I saw your eyelid
twitch. We worked over you with artificial respiration
till it looked as if there was a chance for you. Then I
shut off the power and let the waters rush in over the
Atom Smasher, and swam ashore. And there it lies at
the bottom of the pool, and may it lie there till the

Judgment Day."

"Tode was a genius," said Jim, "but he never understood that character counts for more than genius."

"Let's think no more about him," said Lucille. She had come up to them, and the two looked at each other and smiled. Love is self-centred; other things it forgets very quickly.

"To-morrow we go back to New York," said Jim. "You think you're able to face the world and take up life again?"

"I think so, Jim," said Lucille.

"You're not remembering him after all?"

"No, Jim. I was thinking of poor Cain. He died for me."

"But that was twelve thousand years ago, my dear, and to-day's to-day," said Jim. "And to-morrow a new life begins for you and me."

He drew her closer to him. No, he would never quite forget, but that was twelve thousand years ago ... and to-morrow was his wedding day.

The Readers' Corner, May 1930

June 1930

#29 Out Of The Dreadful Depths, By Charles Willard Diffin:

Robert Thorpe seeks out the nameless horror that is sucking all human life out of ships in the south pacific.

Aproximate word count: 10,400

Bigotry:

Warnings:

- - -

Robert Thorpe reached languidly for a cigarette and, with lazy fingers, extracted a lighter from his pocket.

"Be a sport," he repeated to the gray haired man across the table. "Be a sport, Admiral, and send me across on a destroyer. Never been on a destroyer except in port. It ... would be a new experience ...

enjoy it a lot...."

In the palm-shaded veranda of this club-house in Manila, Admiral Struthers, U. S. N., regarded with undisguised disfavor the young man in the wicker chair. He looked at the deep chest and the broad shoulders which even a loose white coat could not conceal, at the short, wavy brown hair and the slow, friendly smile on the face below.

A likable chap, this Thorpe, but lazy—just an idler—he had concluded. Been playing around Manila for the last two months—resting up, he had said. And from what? the Admiral had questioned disdainfully.

Admiral Struthers did not like indolent young men, but it would have saved him money if he had really got an answer to his question and had learned just why and how Robert Thorpe had earned a vacation.

"You on a destroyer!" he said, and the lips beneath the close-cut gray mustache twisted into a smile.

"That would be too rough an experience for you, I am afraid, Thorpe. Destroyers pitch about quite a bit, you know."

He included in his smile the destroyer captain and the young lady who completed their party. The young lady had a charming and saucy smile and knew it; she used it in reply to the Admiral's remark.

"I have asked Mr. Thorpe to go on the *Adelaide*," she said. "We shall be leaving in another month—but Robert tells me he has other plans."

"Worse and worse," was the Admiral's comment. "Your father's yacht is not even as steady as a destroyer. Now I would suggest a nice comfortable liner...."

Robert Thorpe did not miss the official glances of amusement, but his calm complacency was unruffled. "No," he said, "I don't just fancy liners. Fact is, I have been thinking of sailing across to the States alone."

The Admiral's smile increased to a short laugh. "I would make a bet you wouldn't get fifty miles from Manila harbor."

The younger man crushed his cigarette slowly into

the tray. "How much of a bet?" he asked. "What will you bet that I don't sail alone from here to—where are you stationed?—San Diego?—from here to San Diego?"

"Humph!" was the snorted reply. "I would bet a thousand dollars on that and take your money for Miss Allaire's pet charity."

"Now that's an idea," said Thorpe. He reached for a check book in his inner pocket and began to write.

"In case I lose," he explained, "I might be hard to find, so I will just ask Miss Allaire to hold this check for me. You can do the same." He handed the check to the girl.

"Winner gets his thousand back, Ruth; loser's money goes to any little orphans you happen to fancy."

"You're not serious," protested the Admiral.

"Sure! The bank will take that check seriously, I promise you. And I saw just the sloop I want for the

trip ... had my eye on her for the past month."

"But, Robert," began Ruth Allaire, "you don't mean to risk your life on a foolish bet?"

Thorpe reached over to pat tenderly the hand that held his check. "I'm glad if you care," he said, and there was an undertone of seriousness beneath his raillery, "but save your sympathy for the Admiral. The U. S. Navy can't bluff me." He rose more briskly from his chair.

"Thorpe...." said Admiral Struthers. He was thinking deeply, trying to recollect. "Robert Thorpe.... I have a book by someone of that name—travel and adventure and knocking about the world. Young man, are you *the* Robert Thorpe?"

"Why, yes, if you wish to put it that way," agreed the other. He waved lightly to the girl as he moved away.

"I must be running along," he said, "and get that boat. See you all in San Diego!"

* * *

he first rays of the sun touched with golden fingers the tops of the lazy swells of the Pacific. Here and there a wave broke to spray under the steady wind and became a shower of molten metal. And in the boat, whose sails caught now and then the touch of morning, Robert Thorpe stirred himself and rose sleepily to his feet.

Out of the snug cabin at this first hint of day, he looked first at the compass and checked his course, then made sure of the lashing about the helm. The steady trade-winds had borne him on through the night, and he nodded with satisfaction as he prepared to lower his lights. He was reaching for a line as the little craft hung for an instant on the top of a wave. And in that instant his eyes caught a marking of white on the dim waters ahead.

"Breakers!" he shouted aloud and leaped for the lashed wheel. He swung off to leeward and eased a bit on the main-sheet, then lashed the wheel again to hold on the new course.

Again from a wave-crest he stared from under a sheltering hand. The breakers were there—the smooth swells were foaming—breaking in mid-ocean where his chart, he knew, showed water a mile deep. Beyond the white line was a three-master, her sails shivering in the breeze.

The big sailing ship swung off on a new tack as he watched. Was she dodging those breakers? he wondered. Then he stared in amazement through the growing light at the unbroken swells where the white line had been.

He rubbed his sleepy eyes with a savage hand and stared again. There were no breakers—the sea was an even expanse of heaving water.

"I could swear I saw them!" he told himself, but forgot this perplexing occurrence in the still more perplexing maneuvers of the sailing ship.

This steady wind—for smooth handling—was all that such a craft could ask, yet here was this old-timer of the sea with a full spread of canvas booming and

cracking as the ship jibed. She rolled far over as he watched, recovered, and tore off on a long, sweeping circle.

The one man crew of the little sloop should have been preparing breakfast, as he had for many mornings past, but, instead he swung his little craft into the wind and watched for near an hour the erratic rushes and shivering haltings of the larger ship. But long before this time had passed Thorpe knew he was observing the aimless maneuvers of an unmanned vessel.

And he watched his chance for a closer inspection.

The three-master *Minnie R.*, from the dingy painting of the stern, hung quivering in the wind when he boarded her. There was a broken log-line that swept down from the stern, and he caught this and made his own boat fast. Then, watching his chance, he drew close and went overboard, the line in his hand.

"Like a blooming native after cocoanuts," he told himself as he went up the side. But he made it and

pulled himself over the rail as the ship drew off on another tack.

Thorpe looked quickly about the deserted deck. "Ahoy, there!" he shouted, but the straining of rope and spars was his only answer. Canvas was whipping to ribbons, sheets cracked their frayed ends like lashes as the booms swung wildly, but a few sails still held and caught the air.

He was on the after deck, and he leaped first for the wheel that was kicking and whirling with the swing of the rudder. A glance at the canvas that still drew, and he set her on a course with a few steady pulls. There was rope lying about, and he lashed the wheel with a quick turn or two and watched the ship steady down to a smooth slicing of the waves from the west.

And only then did the man take time to quiet his panting breath and look about him in the unnatural quiet of this strangely deserted deck. He shouted again and walked to a companionway to repeat the hail. Only an echo, sounding hollowly from below, replied to break the vast silence.

It was puzzling—inconceivable. Thorpe looked about him to note the lifeboats snug and undisturbed in their places. No sign there of an abandonment of the boat, but abandoned she was, as the silence told only too plainly. And Thorpe, as he went below, had an uncanny feeling of the crew's presence—as if they had been there, walked where he walked, shouted and laughed a matter of a brief hour or two before.

The door of the captain's cabin was burst in, hanging drunkenly from one hinge. The log-book was open; there were papers on a rude desk. The bunk was empty where the blankets had been thrown hurriedly aside. Thorpe could almost see the skipper of this mystery ship leaping frantically from his bed at some sudden call or commotion. A chair was smashed and broken, and the man who examined it curiously wiped from his hands a disgusting slime that was smeared stickily on the splintered fragments. There was a fetid stench within his nostrils, and he passed up further examination of this room.

Forward in the fo'c'sle he felt again irresistibly the recent presence of the crew. And again he found

silence and emptiness and a disorder that told of a fear-stricken flight. The odor that sickened and nauseated the exploring man was everywhere. He was glad to gain the freedom of the wind-swept deck and rid his lungs of the vile breath within the vessel.

He stood silent and bewildered. There was not a living soul aboard the ship—no sign of life. He started suddenly. A moaning, whimpering cry came from forward on the deck!

Thorpe leaped across a disorder of tangled rope to race toward the bow. He stopped short at sight of a battered cage. Again the moaning came to him—there was something that still lived on board the ill-fated ship.

He drew closer to see a great, huddled, furry mass that crouched and cowered in a corner of the cage. A huge ape, Thorpe concluded, and it moaned and whimpered absurdly like a human in abject fear.

Had this been the terror that drove the men into the sea? Had this ape escaped and menaced the officers

and crew? Thorpe dismissed the thought he well knew was absurd. The stout wood bars of the cage were broken. It had been partially crushed, and the chain that held it to the deck was extended to its full length.

"Too much for me," the man said slowly, aloud; "entirely too much for me! But I can't sail this old hooker alone; I'll have to get out and let her drift."

He removed completely one of the splintered bars from the broken cage. "I've got to leave you, old fellow," he told the cowering animal, "but I'll give you the run of the ship."

He went below once more and came quickly back with the log-book and papers from the captain's room. He tied these in a tight wrapping of oilcloth from the galley and hung them at his belt. He took the wheel again and brought the cumbersome craft slowly into the wind. The bare mast of his own sloop was bobbing alongside as he went down the line and swam over to her.

Fending off from the wallowing hulk, he cut the line, and his small craft slipped slowly astern as the big vessel fell off in the wind and drew lumberingly away on its unguided course.

She vanished into the clear-cut horizon before the watching man ceased his staring and pricked a point upon his chart that he estimated was his position.

And he watched vainly for some sign of life on the heaving waters as he set his sloop back on her easterly course.

* * *

It was a sun-tanned young man who walked with brisk strides into the office of Admiral Struthers. The gold-striped arm of the uniformed man was extended in quick greeting.

"Made it, did you?" he exclaimed. "Congratulations!"

"All O.K.," Thorpe agreed. "Ship and log are ready for your verification."

"Talk sense," said the officer. "Have any trouble or excitement? Or perhaps you are more interested in collecting a certain bet than you are in discussing the trip."

"Damn the bet!" said the young man fervently. "And that's just what I am here for—to talk about the trip. There were some little incidents that may interest you."

He painted for the Admiral in brief, terse sentences the picture of that day break on the Pacific, the line of breakers, white in the vanishing night, the abandoned ship beyond, cracking her canvas to tatters in the freshening breeze. And he told of his boarding her and of what he had found.

"Where was this?" asked the officer, and Thorpe gave his position as he had checked it.

"I reported the derelict to a passing steamer that same day," he added, but the Admiral was calling for a chart. He spread it on the desk before him and placed the tip of a pencil in the center of an unbroken

expanse.

"Breakers, you said?" he questioned. "Why, there are hundreds of fathoms here, Mr. Thorpe."

I know it," Thorpe agreed, "but I saw them—a stretch of white water for an eighth of a mile. I know it's impossible, but true. But forget that item for a time, Admiral. Look at this." He opened a brief case and took out a log-book and some other papers.

"The log of the *Minnie R.*," he explained briefly.

"Nothing in it but routine entries up to that morning and then nothing at all."

"Abandoned," mused the Admiral, "and they did not take to the boats. There have been other instances—never explained."

"See if this helps any," suggested Thorpe and handed the other two sheets of paper. "They were in the captain's cabin," he added.

Admiral Struthers glanced at them, then settled back

in his chair.

"Dated September fourth," he said. "That would have been the day previous to the time you found her." The writing was plain, in a careful, well-formed hand. He cleared his throat and read aloud:

"Written by Jeremiah Wilkens of Salem, Mass., master of the *Minnie R.*, bound from Shanghai to San Pedro. I have sailed the seas for forty years, and for the first time I am afraid. I hope I may destroy this paper when the lights of San Pedro are safe in sight, but I am writing here what it would shame me to set down in the ship's log, though I know there are stranger happenings on the face of the waters than man has ever seen—or has lived to tell.

All this day I have been filled with fear. I have been watched—I have felt it as surely as if a devil out of hell stood beside me with his eyes fastened on mine. The men have felt it, too. They have been frightened at nothing and have tried to conceal it as I have done. —And the animals....

"A shark has followed us for days—it is gone to-day. The cats—we have three on board—have howled horribly and have hidden themselves in the cargo down below. The mate is bringing a big monkey to be sold in Los Angeles. An orang-outang, he calls it. It has been an ugly brute, shaking at the bars of its cage and showing its ugly teeth ever since we left port. But to-day it is crouched in a corner of its cage and will not stir even for food. The poor beast is in mortal terror.

"All this is more like the wandering talk of an old woman muttering in a corner by the fireside of witches and the like than it is like a truthful account set down by Jeremiah Wilkins. And now that I have written it I see there is nothing to tell. Nothing but the shameful account of my fear of some horror beyond my knowing. And now that it is written I am tempted to destroy—No, I will wait—"

"And now what is this?" Admiral Struthers interrupted his reading to ask. He turned the paper to read a coarse, slanting scrawl at the bottom of the page.

"The eyes—the eyes—they are everywhere above us—
God help—" The writing trailed off in a straggling
line.

The lips beneath the trim gray mustache drew
themselves into a hard line. It was a moment before
Admiral Struthers raised his eyes to meet those of
Robert Thorpe.

"You found this in the captain's cabin?" he asked.

"Yes."

"And the captain was—"

"Gone."

"Blood stains?"

"No, but the door had been burst off its hinges. There
had been a struggle without a doubt."

The officer mused for a minute or two.

"Did they go aboard another vessel?" he pondered.

"Abandon ship—open the sea-cocks—sink it for the insurance?" He was trying vainly to find some answer to the problem, some explanation that would not impose too great a strain upon his own reason.

"I have reported to the owners," said Thorpe. "The *Minnie R.* was not heavily insured."

The Admiral ruffled some papers on his desk to find a report.

"There has been another," he told Thorpe. "A tramp freighter is listed as missing. She was last reported due east of the position you give. She was coming this way—must have come through about the same water—" He caught himself up abruptly. Thorpe sensed that an Admiral of the Navy must not lend too credulous an ear to impossible stories.

"You've had an interesting experience, Mr. Thorpe," he said. "Most interesting. Probably a derelict is the answer, some hull just afloat. We will send out a general warning."

He handed the loose papers and the log book to the younger man. "This stuff is rubbish," he stated with emphasis. "Captain Wilkins held his command a year or so too long."

"You will do nothing about it?" Thorpe asked in astonishment.

"I said I would warn all shipping; there is nothing more to be done."

"I think there is." Thorpe's gray eye were steady as he regarded the man at the desk. "I intend to run it down. There have been other such instances, as you said—never explained. I mean to find the answer."

Admiral Struthers smiled indulgently. "Always after excitement," he said. "You'll be writing another book, I expect. I shall look forward to reading it ... but just what are you going to do?"

"I am going to the Islands," said Thorpe quietly. "I am going to charter a small ship of some sort, and I am going out there and camp on that spot in the hope of

seeing those eyes and what is behind them. I am leaving to-night."

Admiral Struthers leaned back to indulge in a hearty laugh. "I refused you a passage on a destroyer once," he said, "and it was an expensive mistake. I don't make the same mistake twice. Now I am going to offer you a trip....

"The *Bennington* is leaving to-day on a cruise to Manila. I'll hold her an extra hour or two if you would like to go. She can drop you at Honolulu or wherever you say. Lieutenant Commander Brent is in command—you remember him in Manila, of course."

"Fine," Thorpe responded. "I'll be there."

"And," he added, as he took the Admiral's hand, "if I didn't object to betting on a sure thing I would make you a little proposition. I would bet any money that you would give your shirt to go along."

"I never bet, either," said Admiral Struthers, "on a sure loss. Now get out of here, you young trouble-

shooter, and let the Navy get to work." His eyes were twinkling as he waved the young man out.

* * *

Thorpe found himself comfortably fixed on the *Bennington*. Brent, her commander, was a fine example of the aggressive young chaps that the destroyer fleet breeds. And he liked to play cribbage, Thorpe found. They were pegging away industriously the sixth night out when the first S.O.S. reached them. A message was placed before the commander. He read it and tossed it to Thorpe as he rose from his chair.

"S.O.S.," said the radio sheet, "*Nagasaki Maru*, twenty-four thirty-five N., one five eight West. Struck something unknown. Down at the bow. May need help. Please stand by."

Captain Brent had left the room. A moment later, and the quiver and tremble of the *Bennington* told Thorpe they were running full speed for the position of the stricken ship.

But: "Twenty-four thirty-five North," he mused, "and less than two degrees west of where the poor old *Minnie R.* got hers. I wonder ... I wonder...."

"We will be there in four hours," said Captain Brent on his return. "Hope she lasts. But what have they struck out there? Derelict probably, though she should have had Admiral Struthers' warning."

Robert Thorpe made no reply other than: "Wait here a minute, Brent. I have something to show you."

He had not told the officer of his mission nor of his experience, but he did so now. And he placed before him the wildly improbable statement of the late Captain Wilkins.

"Something is there," surmised Captain Brent, "just awash, probably—no superstructure visible. Your *Minnie R.* hit the same thing."

"Something is there," Thorpe agreed. "I wish I knew what."

"This stuff has got to you, has it?" asked Brent as he returned the papers of Captain Wilkins. He was quite evidently amused at the thought.

"You weren't on the ship," said Thorpe, simply. "There was nothing to see—nothing to tell. But I know...."

He followed Brent to the wireless room.

"Can you get the *Nagasaki*?" Brent asked.

"They know we are coming, sir," said the operator.

"We seem to be the only one anywhere near."

He handed the captain another message. "Something odd about that," he said.

"*U. S. S. Bennington*," the captain read aloud. "We are still afloat. On even keel now, but low in water. No water coming in. Engines full speed ahead, but we make no headway. Apparently aground. *Nagasaki Maru*."

"Why, that's impossible," Brent exclaimed impatiently.

"What kind of foolishness—" He left the question uncompleted. The radio man was writing rapidly. Some message was coming at top speed. Both Brent and Thorpe leaned over the man's shoulder to read as he wrote.

"*Bennington* help," the pencil was writing, "sinking fast—decks almost awash—we are being—"

In breathless silence they watched the pencil, poised above the paper while the operator listened tensely to the silent night.

Again his ear received the wild jumble of dots and dashes sent by a frenzied hand in that far-off room. His pencil automatically set down the words. "Help—help—" it wrote before Thorpe's spellbound gaze, "the eyes—the eyes—it is attack—"

And again the black night held only the rush and roar of torn waters where the destroyer raced quivering through the darkness. The message, as the waiting men well knew, would never be completed.

"A derelict!" Robert Thorpe exclaimed with unconscious scorn. But Captain Brent was already at a communication tube.

"Chief? Captain Brent. Give her everything you've got. Drive the *Bennington* faster than she ever went before."

The slim ship was a quivering lance of steel that threw itself through foaming waters, that shot with an endless, roaring surge of speed toward that distant point in the heaving waste of the Pacific, and that seemed, to the two silent men on the bridge, to put the dragging miles behind them so slowly—so slowly.

"Let me see those papers," said Captain Brent, finally. He read them in silence.

Then: "The eyes!" he said. "The eyes! That is what this other poor devil said. My God, Thorpe, what is it? What can it be? We're not all insane."

"I don't know what I expected to find," said Thorpe

slowly. "I had thought of many things, each wilder than the next. This Captain Wilkins said the eyes were above him. I had visions of some sky monster ... I had even thought of some strange aircraft from out in space, perhaps, with round lights like eyes. I have pictured impossibilities! But now—"

"Yes," the other questioned, "now?"

"There were tales in olden times of the Kraken," suggested Thorpe.

"The Kraken!" the captain scoffed. "A mythical monster of the sea. Why, that was just a fable."

"True," was the quiet reply, "that was just a fable. And one of the things I have learned is how frequently there is a basis of fact underlying a fable. And, for that matter, how can we know there is no such monster, some relic of a Mesozoic species supposed to be extinct?"

He stood motionless, staring far out ahead into the dark. And Brent, too, was silent. They seemed to try

with unaided eyes to penetrate the dark miles ahead and see what their sane minds refused to accept.

* * *

It was still dark when the search-light's sweeping beam picked up the black hull and broad, red-striped funnels of the *Nagasaki Maru*. She was riding high in the water, and her big bulk rolled and wallowed in the trough of the great swells.

The *Bennington* swept in a swift circle about the helpless hulk while the lights played incessantly upon her decks. And the watching eyes strained vainly for some signal to betoken life, for some sign that their mad race had not been quite vain. Her engines had been shut down; there was no steerage-way for the *Nagasaki Maru*, and, from all they could see, there were no human hands to drag at the levers of her waiting engines nor to twirl with sure touch the deserted helm. The *Nagasaki Maru* was abandoned.

The lights held steadily upon her as the *Bennington* came alongside and a boat was swung out smartly in

its davits. But Thorpe knew he was not alone in his wild surmise as to the cause of the catastrophe.

"Throw your lights around the water occasionally," Brent ordered. "Let me know if you see anything."

"Yes sir," said the man at the search-light. "I will report if I spot any survivors or boats."

"Report anything you see," said Commander Brent curtly.

"You go aboard if you want to," he suggested to Thorpe. "I will stay here and be ready if you need help."

Thorpe nodded with approval as the small boat pulled away in the dark, for there was activity apparent on the destroyer not warranted by a mere rescue at sea. Gun-crews rushed to their stations; the tarpaulin covers were off of the guns, and their slender lengths gleamed where they covered the course of the boat.

"Brent is ready," Thorpe admitted, "for anything."

They found the iron ladder against the ship's side, and a sailor sprang for it and made his way aboard.

Thorpe was not the last to set foot on deck, and he shuddered involuntarily at the eery silence he knew awaited them.

It was the *Minnie R.* over again, as he expected, but with a difference. The sailing vessel, before he boarded it, had been for some time exposed to the sun, while the *Nagasaki Maru* had not. And here there were slimy trails still wet on the decks.

He went first to the wireless room. He must know the final answer to that interrupted message, and he found it in emptiness. No radio man was waiting him there, nor even a body to show the loser of an unequal battle. But there was blood on the door-jamb where a body—the man's body, Thorpe was sure—had been smashed against the wood. A wisp of black hair in the blood gave its mute evidence of the hopeless fight. And the slime, like the trails on the deck, smeared with odorous vileness the whole room.

Thorpe went again to the deck, and, as on the other

ship, he breathed deeply to rid his lungs and nostrils of the abhorrent stench. The ensign in charge of the boarding party approached.

"What kind of a rotten mess is this?" he demanded.

"The ship is filthy and not a soul on board. Not a man of them, officers or crew, and the boats are all here. It's absolutely amazing, isn't it?"

"No," Thorpe told him, "about what we expected. What do you make of this?" He touched with his foot a broad trail that shone wet in the *Bennington's* lights.

"The Lord knows," said the ensign in wonder. "It's all over and it smells like a rotten dead fish. Well, we will be going back, sir." He called to a petty officer to round up the men, and the boat was brought alongside.

Their return to the *Bennington* again through a pathway of light that Thorpe knew was safe under the black muzzles of the destroyer's guns.

Or was it, he asked himself. Safe! Was anything safe

from this devilish mystery that could pluck each cowering human from the lowest depths of this steel freighter, that could drag her down in the water till the radio man sent his cry: "We are sinking!..."

He told Brent quietly, after the ensign had reported, of the struggles in the wireless room and its few remaining traces. And he watched with the commander through the hour of darkness while the *Bennington* steamed in slow circles about the abandoned hulk, while her search-lights played endlessly over the empty waters and the men at the guns cast wondering glances at their skipper who ordered such strange procedure when no danger was there.

With daylight the scene lost its sense of mysterious threat, and Thorpe was eager to return to the abandoned ship.

"I might find something," he said, "some trace or indication of what we have to fight."

"I must leave," said Commander Brent. "Oh, I'm

coming back, never fear," he added, at the look of dismay on Thorpe's face. The thought of leaving this mystery unsolved was more than that young seeker after adventure could accept.

"I'm coming back," Brent repeated. "I've been in communication with the Admiral—Honolulu has relayed the messages through. All code, of course; we mustn't alarm the whole Pacific with our nightmares. The old man says to stick around and get the low-down on this damn thing."

"Then why leave?" objected Thorpe.

Because I am coming around to your way of thinking, Thorpe. Because I am as certain as can be that we have a monster of some sort to deal with ... and because I haven't any depth charges. I want to run up to the supply station at Honolulu and get a couple of ash-cans of TNT to lay on top of the brute if we sight him."

"Glory be!" said Thorpe fervently. "That sounds like business. Go and get your eggs and perhaps we can

feed them to this devil—raw.... And I think I'll stay here, if you will be back by dark."

"Better not," the other objected; but Thorpe overruled him.

"This thing attacks in the dark," he said. "I will lay a little bet on that. It left the orang-outang on the *Minnie R.*—quit at the first sign of daylight. I will be safe through the day, and besides, the beast has gutted this ship. It won't return, I imagine. And if I stay there for the day—live as they lived, the men who manned that ship—I may have some information that will be of help when you get back. But for Heaven's sake, Brent, don't stop to pick any flowers on the way."

"It's your funeral," said Brent not too cheerfully. "The old man said to give you every assistance, and perhaps that includes helping you commit suicide."

But Robert Thorpe only laughed as Commander Brent gave his orders for a small boat to be lowered. A ship's lantern and rockets for night signals were

taken at the officer's orders. "We'll be back before dark," he said, "but take these as a precaution."

One favor Thorpe asked—that the ship's carpenter go over with him and help him to make a strong-barred retreat of the wireless cabin.

"And I'll talk to you occasionally," he told Brent. "I tried the key while I was aboard; the wireless is working on its batteries."

He waved a cheery good-by as the small boat pulled away. "And hurry back," he called. The destroyer commander nodded an emphatic assent.

On board the *Nagasaki Maru*, Thorpe directed the carpenter and his helpers in the work he wanted done. The man seemed to know instinctively where to put his hands on needed supplies, and the result was a virtual cage of strong oak bars enclosing the wireless room, and braces of oak to bar the single door. Thorpe was not assuming any bravado in his feeling of safety, but he was doing what he had done in many other tight corners, and he prepared his

defences in advance.

These included weapons of offense as well. As the boat with the destroyer's men pulled back to the *Bennington*, he placed in easy reach in a corner of the room a heavy calibered rifle he had taken from his belongings.

And, still, with all his feeling of security, there was a strange depression fell upon him when the *Bennington's* narrow hull was small upon the horizon, and then that, too, was gone and only the heaving swells and the wallowing hulk were his companions.

Only these? He shivered slightly as he thought of that unseen watcher with the devil-eyes whose presence Captain Wilkins had felt—and his men, and the poor terrified ape! He deliberately put from his mind the thought of this; no use to start the day with morbid fears. He went below to examine the cabins. But he carried the heavy elephant gun with him wherever he went.

Below decks the signs of the marauder were

everywhere, yet there was little to be learned. The slimy trails dried quickly and vanished, but not before Thorpe had traced them to the uttermost depths of the ship.

There was not a nook or corner that had gone unsearched in the horrible quest for human food. And one thing impressed itself forcibly upon the man's mind. He found a lantern, and he used it of necessity in his explorations, but this thing had gone through the dark and with unerring certainty had found its way to every victim.

"Can it see in the dark?" Thorpe questioned. "Or...." He visioned dimly some denizen of the vast depths, living beyond the limits of the sun's penetration, far in the abysmal darkness where its only light must be self-made. But his mind failed in the attempt to picture what manner of horror this thing might be.

Even in the hold its evil traces were found. There were tiers of metal drums that still shone wet in his lantern's light. Calcium carbide—for making acetylene, he supposed—marked "Made in U.S.A." The

Nagasaki must have been westward bound.

He went, after an hour or so, to the wireless room, and only when he relaxed in the safety of his improvised fortress did he realize how tense had been every nerve and muscle through his long search. He tried the wireless and got an instant response from the destroyer.

"Don't shoot it too fast," he spelled out slowly to the distant operator: "I am only a dub. Just wanted to say hello and report all O.K."

"Fine," was the steady, careful response. "We have had a little trouble with our condensers—" There was a short pause, then the message continued, this portion dictated by the commander. "Delay not important. We will be back as agreed. Have picked up *S. S. Adelaide* bound east in your latitude. Warned her to take northerly course account derelict. See you later. Signed, Brent, commanding *U. S. S. Bennington*."

The man in the barred room tapped off his

acknowledgement and closed the key. He suddenly realized he had had no breakfast, and the hours had been slipping past. He took his gun again and went down to the galley to prepare some coffee. It was not the time or place for an enjoyable meal, but he would have relished it more had he not pictured the *Adelaide* and her lovely owner steaming across these threatening seas.

He knew the captain of the *Adelaide*. "Obstinate pigheaded old Scotchman!" "Hope he takes Brent's advice. Of course Brent couldn't tell him the truth. We can't blat this wild yarn all over the air or the passenger lines would have our scalps. But I wish the *Adelaide* was safe in Manila."

His explorations in the afternoon were half-hearted and perfunctory. There was nothing more to be learned. But he had seen in his mind some vague outline of what they must meet. He saw a something, mammoth, huge, that could grasp and hold an ocean freighter—against whose great body he had seen the waves dash in a line of white spray. Yet a something that could force its way down narrow passages, could

press with terrific strength on bolted doors and crush them inward, wrecked and splintered. Some serpentine thing that felt and saw its way and crawled so surely through the dark—found its prey—seized it—and carried off a man as easily as it might a mouse.

No octopus, no matter what proportions, filled the description. He gave up trying to see too clearly the awful thing. And he kept away from the ship's rail when once he had ventured near. For there had come to him a feeling of fear that had sent the waves of cold trickling and prickling up his spine. Was there something really there?... A waiting lurking horror in the depths?

"The eyes," he thought, "the eyes!..." And he went more quickly than he knew to his barred retreat where again he might breathe quietly.

* * *

The position of the deserted ship was south of the regular steamer lanes on the TransPacific run. Only a trace of smoke on the northern horizon marked

through the afternoon the passage of other craft. It was a long and lonely vigil for the waiting man. But the *Bennington* would return, and he listened in at intervals hoping to hear her friendly signal.

The batteries operating the *Nagasaki's* wireless were none too strong; Thorpe saved their strength, though he tried at times to raise the *Bennington* somewhere beyond his reach.

The sun was touching the horizon when he got his first response. "Keep up the old nerve," admonished the slow, careful sending of the *Bennington's* operator. "We have been delayed but we are on our way. Signed, Brent."

The man in the wireless room placed the oak bars across the door, and tried to believe he was nonchalant and unafraid as he laid out extra clips of cartridges. But his eyes persisted in following the sinking sun, and he watched from within his cage the coming of the quick dark.

The protecting glare of day must be unbearable to

this monster from the lightless depths, and daylight was vanishing. Thorpe's mind was searching for additional means of defense. He found it in the cargo he had seen. The drums of carbide! He could scatter it on the deck—it reacted with water, and those slimy arms, if they came and touched it, could find the contact hot. He took his lantern and went hastily below to stagger back with a drum upon his shoulder.

In the half-light that was left him he forced the cover and then rolled the drum about the swaying deck. The gray, earthly lumps of carbide formed erratic lines. Useless perhaps, he admitted, but the threatening dark forced the man to use every means at his command.

He was scattering the contents of a second drum when he stiffened abruptly to rigid attention.

The ship, thrown broadside to the wide-spaced swells, had rolled endlessly with a monotonous motion. But now the deck beneath him was steadying. It assumed an abnormal levelness. The boat rose and fell with the waves, but it no longer rolled. There was something

beneath holding, drawing on it.

Thorpe knew in that frozen second what it meant. The drum clattered to the rail as he dashed for his room. Gun in hand, he watched with staring eyes where the deserted deck showed dim and vague in the light of the stars and the bow of the ship was lost in the uncertain dark of night.

Wide-eyed he watched into the blackness, and he listened with desperate attention for some slightest sound beyond the splashing of waves and the creaking of spars.

Far in the west a light appeared, to glow and vanish and glow again in the tumbling waters. The *Bennington*! His heart leaped at the thought, then sank as he knew the destroyer's lights would not appear from that direction.

Through a slow hour that seemed an eternity the oncoming ship drew near, and he knew with a sudden, startling certainty that it was the *Adelaide*—and Ruth Allaire—coming on, through into the horror awaiting.

He leaned forward tensely as a sound reached his ears. A ghostly echo of a sound, like the softest of smooth, slipping fabric upon hard steel. And as he listened, before his staring eyes, a something came between him and the lighted yacht.

It wavered and swung in the darkness. It was formless, uncertain of outline, and it swung in the night out beyond the ship's rail till it suddenly neared, waved high overhead, and the cold light of the stars shone in pale reflection from an enormous, staring eye.

It surmounted a serpentine form that took shape in the dim radiance without and came lower in undulating folds to crash heavily upon the deck.

Thorpe's hand was upon the wireless key. He had wanted to warn off the yacht, but not till the thud of the creature on the bare deck proved its reality could he force his cold fingers to press the key.

Then, fast as his inexperience allowed, he called frantically for the *Adelaide*. He spelled her name, over

and over.... Would the sleepy operator never answer?

The *Bennington* broke in one. "Is that you, Thorpe? What is up?" they demanded.

But Thorpe kept up his slow spelling of the yacht's name. He must get a warning to them! Then he realized that the *Bennington* could do it better.

"*Bennington*," he called, "*Adelaide* approaching. I am attacked. Warn them off. Warn them—" His frantic, hissing dots and dashes died immediately. Beneath his feet the *Nagasaki Maru* was rolling again, swinging free to the lift and thrust of the swells beneath.

"Good God!" he shouted aloud in his lonely cabin. "It's gone for the yacht. *Adelaide*—turn north—full speed—" he clicked off on a slow, stuttering key. "Head north. You are being attacked!" He groaned again as he saw the *Adelaide's* shining ports swing away from the safety of the north; the ship broached broadside to the waves and came slowly to a stop.

"*Bennington*," he radioed. "Brent—it has got the

Adelaide. Help—hurry! I am going over."

He tore wildly at the barred door, and he made a dash across the deck to slip sprawling in a heap against the rail where the slimy traces of the recent visitor stretched glistening on the deck.

How he lowered the boat Thorpe never knew. But he knew there was one that the men from the *Bennington* had swung over the side, and tore madly at the tackle to let the boat crash miraculously upright into the sea. He slung the rifle about his neck with a rope end—there were cartridges in his pocket—and he went down the dangling lines and cast off in a frenzy of haste.

What could he do? He hardly dared form the question. Only this stood clear and unanswerable in his mind: The yacht was in the monster's grip, and Ruth Allaire was there on board. Ruth Allaire, so smiling, so friendly, so lovable! Food for that horror from the depths.... He rowed with super-human strength to drive the heavy boat across the wave-swept distance that separated them.

Between gasping breaths he turned at times to glance over his shoulder and correct his course. And now, as he drew near, he saw though indistinct the unmistakable, snakelike weaving of horrible tenuous fingers, rolling and groping about the yacht.

They were plain as he drew alongside. The trim ship rose and fell with the water, while over her side where Thorpe approached swung a long, white monstrous rope of flesh. It retreated like the lash of a whip, and the horrified watcher saw as it went the struggling figure of a man in the grasp of flabby lips. And above them a single eye glared wickedly.

Another vile, twisting arm rose from the afterdeck with a screaming figure in its grasp and vanished into the water beyond the yacht. There were others writhing about the decks. Thorpe saw them as he made his boat fast and clambered aboard.

A wave of reeking air enveloped him as he reached the deck; the nauseous stench from the monster's tentacles was horrible beyond endurance. He gagged and choked as the stifling breath entered his lungs.

A huge rope of slippery, throbbing flesh stretched its twisted length toward the stern. It contracted as he watched into bulging muscular rings and withdrew from the afterdeck. The deadly end of it stopped in mid-air not twenty feet from where he stood. The jawlike pincers on it held the limp form of an officer in its sucking grip, while above, in a protuberance like a gnarled horn, a great eye glared into Thorpe's with devilish hatred.

The beak opened sharply to drop its unconscious burden upon the deck, and the watching man, petrified with horror, saw within the gaping maw great sucking discs and beyond them a brilliant glow. The whole cavernous pit was aflame with phosphorescent light. Dimly he knew that this light explained the ability of the beastly arms to grope so surely in the dark.

The eye narrowed as the gaping, fleshy jaws distended, and Robert Thorpe, in a flash that galvanized him to action, was aware that his fight for life was on. He fired blindly from the hip, and the recoil of the heavy gun almost tore it from his hands.

But he knew he had aimed true, and the toothless, seeking jaws whipped in agony back into the sea.

There were other arms whose eyes were searching the stern of the yacht. Thorpe plunged frenziedly down a companionway for the cabin he knew was Ruth Allaire's. Was he in time? Could he save her if he found her? His mind was in a turmoil of half-formed plans as he rushed madly down the corridor to find the body of the girl a limp huddle across the threshold of her cabin.

She was alive; he knew it as he swung her soft body across one shoulder and staggered with his burden up the stairs. If he could only breathe! His throat was tight and strangling with the reeking putrescence in the air. And before his eyes was a picture of the strong oak bars of his own retreat. Somehow, some way, he must get back to the abandoned ship.

An eye detected him as he came on deck, and he dropped the limp body of the girl at his feet as he swung his rifle toward the glowing light within the opening jaws. The sucking discs cupped and wrinkled

in dread readiness in the fleshy, toothless opening. He emptied the magazine into the head, though he knew this was only a feeler and a feeder for a still more horrible mouth in the monstrous body that rose and fell tremendously in the dark waters beyond. But it was typical of Robert Thorpe that even in the horror and frenzy of the moment he rammed another clip of cartridges into his rifle before he stooped to again raise the prostrate figure of Ruth Allaire.

The forward deck for the moment was clear; it rose high with the weight of the writhing, twisting arms that weighed down the stern of the yacht where the crew had taken refuge.

To think of helping them was worse than folly—he dismissed the thought as another great eye came over the rail. Once more he used the gun, then lowered the girl to the waiting boat, and cast off and rowed with the stealthiest of strokes into the dark.

Behind him were whipping points of light above the white brilliance of the yacht *Adelaide*. The boat was tossing in great waves that came from beyond, where

a body, incredibly huge, was tearing the waters to foam. There were ghostly arms that shone in slimy wetness, that lashed searchingly in all directions, as the monster gave vent to its fury at Thorpe's attack. There were screaming human figures grasped in many of the jaws, and the man was glad with a great thankfulness that the girl's stupor could save her from the frightful sight.

He dared to row now, and his breath was coming in great choking sobs of sheer exhaustion when at last he pulled the senseless form of Ruth Allaire to the deck of the *Nagasaki* and drew her within the frail shelter of the wireless room.

Stout had the oaken bars appeared, and safe his refuge in the barricaded room, but that was before he had seen in horrible reality the fearful fury of this monster from the deep. He placed the braces against the door and turned with hopeless haste to seize the wireless key.

"*Bennington*," he called, and the answer came strong and clear. "Where are you.... Help—" His fingers froze

upon the key and the answering message in his ears was unheeded as he watched across the water the destruction of the yacht.

This craft that had dared to resist the onset of the brute, to fight against it, to wound it, was feeling the full fury of the monster's rage. The gleaming lights of the doomed ship were waving lines that swept to and fro in the grip of those monstrous arms. The boat beneath Thorpe's feet was tossing in the waves that told of the titanic struggle. He had meant to look south for some sign of the oncoming destroyer, but in fearful fascination he stared spellbound where the masts of the trim yacht swept downward into the waves, where the green of her star-board lantern glowed faintly for an instant, then vanished, to leave only the darkness and the starlit sea.

A voice aroused him from his stupefaction. "Where am I ... where am I?" Ruth Allaire was asking in a frightened whisper. "That terrible thing—" She shuddered violently as memory returned to show again the horror she had witnessed. "Where are we, Robert? And the *Adelaide*—where is it?"

Thorpe turned slowly. The insane turmoil of the past hour had numbed his brain, stunned him.

"The *Adelaide*—" he mumbled, and groped fumblingly for coherent thoughts. He stared at the girl. She was half-risen from the floor where he had laid her, and the sight of her quivering face brought reason again to his mind. He knelt tenderly beside her and raised her in his arms.

"Where is the yacht?" she repeated. "The *Adelaide*?"

"Gone," Thorpe told her. "Lost!" A thought struck him.

"Was your father on board, Ruth?"

Ruth was dazed.

"Lost," she repeated. "The *Adelaide*—lost!... No," she added in belated response to Thorpe's question.

"Daddy was not there. But the men—Captain MacPherson ... that horrible monster...." She buried her face in her hands as she realized what Thorpe's silence meant.

He held the trembling figure close as the girl whispered: "Where are we, Robert? Are we safe?"

"We may win through yet," he told her through grim, set lips. He realized abruptly that he was seeing the face of Ruth Allaire in the light. He had left a lantern burning! He withdrew his arms from about her and sprang quickly to his feet to put out the tell-tale light. In darkness and quiet was their only safety. And he knew as he sprang that he had waited too long. A soft body crashed heavily on the deck outside.

The girl's voice was shrill with terror as she began a question. Thorpe's hand pressed upon her lips in the dark where he stood waiting—waiting.

A luminous something was glowing outside the cabin. It searched and prodded about the deserted deck to whip upward at the audible hiss of wet carbide. Another appeared; the rifle came slowly to the man's shoulder as a pair of jaws gaped glowingly beyond the windows and an eye stared unblinkingly from its hornlike sheath. It crashed madly against the walls of the wireless room to shatter the glass and make

kindling of the woodwork of the sash. Thorpe fired once and again before the specter vanished, and he knew with sickening certainty that the wounds were only messages to some central brain that would send other ravening tentacles against them. But the oak bars had held.

He reached in the brief interval for the key, and he sent out one final call for help. He strained his ears against the head-set for some friendly human word of hope.

"—rocket," the wireless man was saying. "Fire rockets. We can't find—" A swift, writhing arm wrapped crushingly about the cabin as the message ceased.

Thorpe seized his rifle and fired into the gray mass that bulged with terrible muscular contractions through the window. He fired again to aim lengthways of the arm and inflict as damaging a wound as his weapon would permit.

The arm relaxed, but a score of others took up the

attack. Again the sickening stench was about them as gaping jaws gleamed fiery beneath the hateful eyes and tore at the flimsy structure. Thorpe jammed more cartridges into the gun and fired again and again, then dropped the weapon to fumble for the rockets that Brent had given him.

He lighted one with trembling fingers; the first ball shot straight into a waiting mouth. Another ignited a searing flame of acetlylene gas where a wet arm writhed in the hot carbide trail. The man leaned far out through the broken window.

No time to look around. He let the red flares stream upward high into the air, then dropped the rocket hissing on the deck to seize once more the rifle.

A mass of muscle crashed against the door; it went to splinters under the impact, and only the two oak bars remained to hold in check the horrible tentacles and the darting heads. One mouth closed to a pointed end that forced its way between the bars. The oak gave under the strain as Robert Thorpe pulled vainly at an empty gun. Beside him rose shrieks of terror as the

monstrous thing came on, and Thorpe beat with frantic fury with his clubbed rifle at the fleshy snout.

He knew as he swung the weapon that the shrieks had ceased, then smiled grimly in the numbing horror as he realized that Ruth Allaire was beside him. A piece of oak was in her hands, and she was striking with desperate and silent fury at the slimy flesh.

It was the end, Thorpe knew, and suddenly he was glad. The nightmare was over, and the end was coming with this girl beside him. But Robert Thorpe was fighting on to the last, and he tried to make his blows reach outward to the hateful devilish eye.

He saw it plainly now, for the deck was a glare of white light. He saw the eye and the thick arm behind it and the score of others that made a heaving, knotted mass were brilliant and wetly shining. He could see now how best to strike, and he turned his gun to thrust with the barrel at the eye.

It withdrew before his stroke—the jaws slid backward to the deck. There were sounds that hammered at his

ears. "The guns! The guns!" a girl was screaming. Across the deck, where a search-light played, huge arms were lashing backward toward the sea. The waves beyond had vanished where a monstrous body shone wetly black in a blinding glare.

And the man hung panting, helpless, on the one remaining bar across the doorway to look where, beyond, her forward guns a spitting stream of staccato flashes, the *Bennington* tore the waves to high-thrown spray. Her four clean funnels swung far over as the slim ship, with her stabbing, crashing guns, swung in a sweeping circle to bear down upon the black bulk slowly sinking in the search-light's glare.

The vast body had vanished as the destroyer shot like one of her own projectiles over the spot where the beast had lain. And then, where she had passed, the sea arose in a heaving mound. The big ship beneath the watching man shuddered again as another depth charge grumbled its challenge to the master of the deeps.

The warship went careening on an arc to return and throw the full glare of her search-lights on the scene. They lighted a vast sea, strangely stilled. An oily smoothness leveled waves and ironed them out to show more clearly the convulsions of a torn mass that rose slowly into sight.

Thorpe in some way found himself outside the cabin. And he knew that the girl was again beside him as he stared and stared at what the waters held. A bloated serpent form beyond believing was struggling in the greasy swell. Its waving tentacles again were flung aloft in impotent fury, and, beneath them, where their thick ends jointed the body, a head with one horrible eye rose into the air. A thick-lipped mouth gaped open, and the gleam of molars shone white in the blinding glare.

[Image description: A black and white illustration of the sea monster assaulting a ship, with part of its central body with the large eye just above the surface of the water, and its smaller feelers snaking out of the water in every direction and latching onto the ship, which is tilting in the roiling waters. Image description end.]

The twisting body shuddered throughout its vast bulk, and the waving arms and futile staring eyes dropped helpless into the splashing sea. Again the revolting

head was raised as the destroyer sent a rain of shells into its fearful mass. Once more the oily seas were calm. They closed over the whirling vortex where a denizen of the lightless depths was returning to those distant, subterranean caverns—returning as food for what other voracious monsters might still exist.

The man's arm was about the figure of the girl, trembling anew in a fresh reaction from the horror they had escaped, when a small boat drew alongside.

"They're safe," a hoarse voice bellowed back to the destroyer, and a man came monkeywise up a rope where Thorpe had launched his boat.

And now, as one in a dream, Thorpe allowed the girl to be taken from him, to be lowered to the waiting boat. He clambered down himself and in silence was rowed across to the destroyer.

"Thank God!" said Brent, as he met them at the rail. "You're safe, old man ... and Miss Allaire ... both of you! You let off that rocket just in time; we couldn't pick you up with our light—

"And now," he added, "we're going back; back to San Diego. The Admiral wants a word of mouth report."

Thorpe stilled him with a heavy gesture. "Give Ruth an opiate," he said dully. "Let her forget ... forget!... Good God, can we ever forget—" He stumbled forward, heedless of Brent's arm across his shoulders as the surgeon took the girl in charge.

* * *

Admiral Struthers, U.S.N., leaned back from his desk and blew a cloud of smoke thoughtfully toward the ceiling. He looked silently from Thorpe to Commander Brent.

"If either one of you had come to me with such a report," he said finally, "I would have found it incredible; I would have thought you were entirely insane, or trying some wild hoax."

"I wish it were a damn lie," said Thorpe quietly. "I wish I didn't have to believe it." There were new lines about the young-old eyes, lines that spoke what the

lips would not confess of sleepless nights and the impress of a picture he could not erase.

"Well, we have kept it out of the papers," said the Admiral. "Said it was a derelict, and the wild messages floating about were from an inexperienced man, frightened and irresponsible. Bad advertising—very—for the passenger lines."

"Quite," Commander Brent agreed, "but of course Mr. Thorpe may want to use this in his next book of travel. He has earned the right without doubt."

"No," said Thorpe emphatically. "No! I told you, Brent, there was often a factual basis for fables—remember? Well, we have proved that. But sometimes it is best to leave the fables just fables. I think you will agree." A light step sounded in the corridor beyond. "Nothing of this to Miss Allaire," he said sharply.

The men rose as Ruth Allaire entered the room. "We were just speaking," said the Admiral with an engaging smile beneath his close-cut mustache, "of the matter of a bet. Mr. Thorpe has won handily, and

he has taught me a lesson."

He took a check book from his desk. "What charity would you like to name, Miss Allaire? That was left to you, you remember."

"Some seamen's home," said Ruth Allaire gravely. "You will know best, if you two are really serious about that silly bet."

"That bet, my dear," said Robert Thorpe with smiling eyes, "was very serious ... and it has had most serious consequences." He turned to the waiting men and extended a hand in farewell.

"We are going to Europe, Ruth and I," he told them. "Just rambling around a bit. Our honeymoon, you know. Look us up if you're cruising out that way."

#30 The Cavern World, By James P. Olsen:

A great oil field had gone dry—and Asher, trapped far under the Earth among the revolting petrolians, learns why.

Approximate word count: 7,000

Bigotry:

Warnings:

- - -

"Impossible! What sort of creatures would they be, that could live two miles beneath the surface of the earth? Surely, Asher, you are joking!"

R. Briggs Johns, mighty power back of Stan-America Oil Corporation, looked at Blaine Asher closely, expecting to see the chief geologist and scientist of the company laugh. But Blaine Asher did not laugh. Serious, his rather thin face grave as he leaned his tall, muscular body above a torsion machine he was adjusting, there was nothing to indicate he had the

faintest idea of a joke.

"Why damn it, Asher!" Johns insisted wrathfully, "you don't really mean that. And"—he took a nervous turn around the laboratory—"if such a wild thing were possible, what has that to do with our trouble? You haven't led me on to spend a million dollars drilling a thirty-six-inch hole, just so you could test a fantastic theory?"

"You know better than that." Asher wiped his hands and leaned against a table. Johns, looking into the cool gray eyes of the man before him, did know better. Blaine Asher was more than just a geologist or scientist. Well he might be termed a master geo-metallurgist. Johns nodded, wiping beads of perspiration from his brow.

"You say impossible—and want to know how those creatures cause this field, the largest oil field in the world, to start going bone dry over night. All right:

"Remember how you laughed when I told you that oil would some day be mined instead of pumped or

flowed from the earth? You couldn't see how one central shaft could be sunk, then tunnels run back underneath the oil strata, tapping the sand from the bottom and letting the oil run down to be pumped out one shaft. Yet, that way, we would get *all* the oil, instead of the possible one-eighth of the total amount as we get by present methods.

"Now, you have seen that done. And you said that was impossible."

"Yes," Johns objected, "but those test wells we mined were only a few hundred feet deep. Wells in this field are eight thousand feet deep! Think of the heat, man! You can't do it. And as for people—"

"Your great field has suddenly gone dry, almost in a month's time," Asher stopped him. "What is happening here can happen elsewhere. Only, formations in this field are more suited to there being life—or something—below us. Stan-America is going broke. Many others have already gone broke. Still, that oil couldn't have gotten away.

"As for heat—yes, we know that oil is hot when it comes up from the oil sand at eight thousand feet, or from ordinary wells at three to six thousand feet. But"—Asher lit a cigarette and inhaled deeply—"gas coming out of the same well is *cold*! So cold it forms frost inches thick on pipes and tanks.

"Rock pressure—the pressure of the earth—forcing up the gas, causes that. Why couldn't that same pressure cool great caverns below the granite cap below the oil sands? It could. For that matter, I know that same pressure will generate useful power. I'll show you that in a minute."

"All right!" Johns chewed his cigar almost savagely. "Say, then, that you can work down there, nearly two miles underground; granted that we can tunnel from beneath the sands and pump more oil from one central shaft than we now do from fifty wells—what has that to do with this tosh about a race of people?"

"They are not people, perhaps." Asher grinned at the "there, I've stuck you!" look on Johns' face. "Let's say, rather, creatures. Have you ever met Lee Wong, the

great Chinese scientist, or his Russian geological collaborator, Krenski? No?

"Well, I have. I met them in Paris in 1935—five years ago. They're brilliant men, and they've prepared some wonderful papers. Brilliant, I said: they are also dangerous. They claim, you know, that the fossils we now drill up come from a lost race—people who went *into* the earth while man, like us, was coming up onto the earth from the water. Some claim those fossils have been on the surface at one time, and were silted over. But eight thousand feet is a lot of silt, Johns: ever thought of that?"

"Good God!" Johns gasped hoarsely. "You almost make me believe you are right. But, supposing there is such a race of things—what will you do?"

"This." Asher drew back a curtain that was stretched across one end of the laboratory. "You know I was working on a cage in which to descend into that eight-thousand-foot well you've drilled—the well you're going to use to try and find why this field is suddenly gone dry. This it it."

Johns stared, shook his head wonderingly and stared again. Before him, ready to be transported to the well that was larger than any ever drilled before, stood what Blaine Asher called his Miner, for want of a better name.

A thick steel tube, it was. Twelve feet long and large enough around that a man might stand inside of it. The top was welded on in much the manner a top is welded on an ordinary hot-water heater, and had connections for hose in it. At the height of a man's eyes heavy windows were set in, and in one side was a door just large enough to admit a man's body. This door sealed tight the minute it closed.

"It looks like—like some sort of a deep sea diving outfit," Johns said as he walked around the braces that held the Miner upright. "But all those gadgets inside and on the bottom—?" He indicated the strange instruments that could be seen when the door was opened, and the queer glass tubes that projected from the very bottom.

"Pressure-power units—my own invention," Asher told

him. "For ten years I've been working on this. I knew that some day I would want to explore the oil caverns beneath the earth, so I made ready.

"As I told you, rock pressure, or earth pressure, is a tremendous thing. It is power, so I figured how to use it. Under artificial pressure, I have tried out my Miner and its equipment.

"Those tubes sticking from the bottom contain something you are familiar with: non-burning and non-explosive helium gas. I have discovered a way, by their use, to create power that will melt away rock or iron—literally dissolve it into nothing! Not in an hour, or minutes. In seconds, Johns!

"The pressure of the earth acts as my generator. The pressure action on the filaments of platinum, and several compositions I have no time to explain now, causes heat. Call it friction of compressed air, if you wish. As neon gases carry an electric spark, so does this helium carry the power generated by earth pressure. The pressure below earth acts on the delicate coils and points of my generator. This bit of

power is carried into the helium tubes, and by a system of vacuum power, is increased millions of times. Thus, the tiny spark of a cigar lighter would electrocute a hundred men!"

"I—you mean somewhat like a violet ray is increased in the lightning tubes?" Johns strove to grasp the foundation of the thing.

"Yes, the foundation of it all—with the earth's pressure the power motive," Asher nodded. "So, after my Miner is on the bottom of our well, I can burn—or dissolve—a room as large as this laboratory in a few minutes. The whole thing is no mystery after you learn it—not nearly so much as radium, or radio, was. Merely creating a spark of electricity and fanning it through a vacuum and a conductor of massed gases."

"But"—Johns had unconsciously dropped his voice to a whisper—"what of these strange creatures? How would you deal with them? Damn it, Asher, I think I'm beginning to believe this nutty idea of yours. Any man who can generate power with the pressure of air as it is packed by earth must know what he is talking

about!"

"I have but one protection against anything down there that tries to harm me," Asher said simply. "That is this—see?"

What he held up looked like an old-fashioned six shooter. It was fitted with a platinum-sealed box in the place where a cylinder would have been. The barrel looked like some queer, blue glass.

"Do you see that test tube?" Asher pointed to a glass tube on a table a few feet away. "Now watch."

He pressed a tiny ratchet under his thumb. A snapping, buzzing noise filled the laboratory. Johns gave an exclamation of wonder and awe. Quickly, the test tube started to melt into a pool of molten glass. Asher increased the pressure of his ratchet trigger. The tube was knocked to the floor.

"Static electricity—always some form of electricity," said Asher grinning at the astonished oil baron.

"Conductor coils here," he continued as he tapped the

sealed cylinder, "are charged much as a flash-lamp battery. The charged conductors attract the static electricity of the air, and, in a manner similar to the action of the power generator, increase power. There is a slight difference: by turning quick power on my static gun, I can cause the charge to knock down and merely electrocute, as I knocked the half-melted tube from the table."

"I can understand that, a little," Johns sighed profoundly. "It's the same juice that causes a gasoline truck to catch fire if you don't have a ground chain on it somewhere. But, just the same, I claim it's remarkable."

"Not half as remarkable as what I expect to find two miles down when I descend to-morrow." Asher had a dreamy look in his eyes. "I wonder: new ways to get petroleum wealth ... a strange people...."

"Men,"—Asher, a tight-fitting asbestos composition suit covering him from foot to neck, spoke tersely—"when you get me on bottom, stop every bit of machinery, and don't dare pull up until I give the

signal. If I'm down there the entire day, all right. But"—he smiled, trying to make light of the danger—"if I don't signal within thirty-six hours, pull up anyhow."

From the bull-wheels of the drilling rig Asher spooled out some of the air-hose cable through which air blown over ice would be pumped into the Miner; then when the long steel cylinder was over the hole and ready, he turned to the company officials and government scientists and engineers around him in the boarded-up derrick.

"Possibly I can get a survey in an hour. Perhaps I'll have to come back to the surface and make adjustments to my equipment. That remains to be seen.... Now, let's get low."

He adjusted a helmet over his head. It looked much like the helmet worn by a sea diver, except that it had no connecting hose for air. The windows in the helmet, which contained pressure lights, worked on the same principle as the disintegrating rays of the Miner. When Asher turned the ratchet that set the

little pressure machine into motion, a violet tinged green ray of great lighting power shot out and increased, by weight of air, or atmosphere beneath the earth, the power of one tiny spark a million times.

Without ceremony or farewell, Asher crawled inside his tube. The door was closed and he fastened it from inside. For a moment, wild panic assailed him. But he fought it off, becoming again less the feeling human and more the cold calculator of advanced science. The light from outside, coming in through the windows of the Miner, was shut off. The long steel cage clanked against the sides of the special casing in the well, and Blaine Asher was on his trip into a lower world never before visited by man.

That was what Asher believed. But, had he known what waited for him, two miles into the bowels of the earth....

At five hundred feet, the descent stopped, giving him time to adjust himself to the pressure change. The gas and oil had been eased out of the hole. That is, the casing had been run on through the producing strata,

shutting it off. Asher signaled by buzzer, and a stream of the ice-washed air flowed down to him.

Three thousand feet! Six thousand feet! More than a mile down! Sweat poured from his body in streams, and the air coming into the Miner through the hose did not relieve him. It was hot—almost unbearably so. His ears were roaring. The dark of his tube was relieved as he turned on his pressure lamps. He adjusted the pressure discs over his ears by twisting a thumbscrew on his helmet, and the pounding of his ear-drums ceased.

Gasping, he watched the depth meter in front of him. It did not seem as if he was moving, but the indicator now showed more than seven thousand feet. It moved around slowly and more slowly; trembled at eight thousand—and stopped.

Like the snapping of a man's fingers, the temperature inside the Miner changed. Asher was now fifty feet below the bottom of the oil and gas sands, and if his theory about rock pressure worked.... It *was* working. Frost was forming on the inside of the Miner!

"I'm right—right—right!" Asher thought, elated, sending his buzzer signal up to those so far above. The icy air through his hose changed to air of normal temperature. He signaled for slack in the lowering cable, then prepared for the greatest test of all.

Cramped, with hardly room to move, he studied his gages. Helium tubes at the proper pressure for compressing the tiny spark of the pressure generator, so it would flare a million times stronger under the action of the vacuum tubes: diamond and cut-glass tubes in the bottom of the Miner, thermoed with layers of quicksilver: everything cleared, everything ready.

His hand shaking, Asher pushed the tiny switch that brought his filament points trembling together under the atmospheric pressure so far underground. A tiny spark danced and throbbed through the tiny glass tube before him, beginning to buzz as it started the circuit of increasing coils, and soon humming and vibrating as the helium and vacuum tubes swelled it to full power. Spark after spark, increased almost beyond imagination, followed one after another. The

Miner throbbed and shook.

White-faced, Asher touched the little lever that opened the blasting outlets in the bottom. Almost instantly the Miner dropped a full six inches—went on, down to a foot. Asher, pride of success choking him, pulled the lever hard over, which brought some of the tubes beneath him spreading out, to blast away the earth on each side of him.

He signaled for more and more slack as the depth indicator showed he had burned, or disintegrated, his way down to thirty feet beyond the original bottom of the hole. He was below the bottom of the protecting wall of casing now—at the mercy of the pressure of two miles of earth.

Slowly, setting all his bottom tubes to cutting away on all sides of him, he started hollowing out enough room to step out into. His lights, when he looked through the windows, showed ghostly on earth ten feet on each side of him. Ten more minutes and he had created a room nearly twenty-five feet square—a man-made cave, two miles below the surface.

There was something akin to awe in the feelings of Asher when he opened the little door, crawled out and stood erect. The pressure lamps in his helmet lit up the room he had made. There were no sounds, just a vague, ringing silence.

Then so quickly that it robbed him of his senses, two things happened. A hundred yards away from the well in which he had descended, another well, drilled by another oil company, was shot. Three hundred quarts of nitro-glycerine were set off in the hole.

Asher screamed and clamped his ear discs down tight. It seemed the very gods of thunder were shrieking and raging in his head; every nerve and fiber in his body throbbed and tingled with the hellish vibration.

On his knees, where the shock had thrown him, in darkness beyond description, Asher realized the lights from the Miner no longer shone out. Frantically, he adjusted the small lights in his helmet and got them to sending off their rays again. Then, an icy hand seemed to squeeze his heart, turning his blood to ice-

water in his veins. He cursed himself for not foreseeing that some company might shoot a well close by, while he was underground.

He turned. The Miner was all right, but Blaine Asher was trapped! For the walls of the hole below the bottom of the casing had caved. Thirty feet of rock, sand and conglomerate matter were between him and the bottom of the pipe.

He was trapped—two miles below the earth. There was no hope of rescue, the hope that miners feel in deep shafts. There could be no rescue for Asher. No one could get to him. He cried out his horror, fighting to keep from swooning.

The helmet hampered him. He turned on a small pressure lamp attached to the belt at his waist, and chanced taking the helmet off. Dank and nauseous was the air that he breathed, since it no longer came through the filters in his helmet. But it was air that would serve, nevertheless.

A crackling, rumbling sound caused him to turn

quickly. Eyes wide, he stared at the long crack that was opening before him.

Asher was between two layers of granite—one layer under him, and another above him, just below the oil sands. Now, as the crack between these two layers widened, he could see it slope downward until it ended in a great cavern that stretched endlessly away beyond the beams of his light.

It wasn't this crack that caused Blaine Asher, an iron-hearted man of science, to choke and sag down to a sitting position, his knees refusing to support him. No—it was the terrible, Godless, unbelievable *Things* that scurried around in the smooth rock hall that stretched away into the cavern.

Frozen with soul-chilling fear, Asher stared with eyes that bulged. What were they? Spawned neither of God nor Satan—what could they be? Black-skinned—or was it skin?—like rubber, with round bodies, like black basket balls inflated to triple size; bodies that seemed to ripple, distort, swell and contract with life within life.

Short, foot-long stems that must have been legs, ending in round balls that served as feet, no doubt. Tentacles, Asher would have called them, six feet in length, thick as mighty cables and dotted with suckers like the tentacles of an octopus. And heads—Asher gagged and vomited!

Not heads. Just masses of the black body substance as large as the two fists of a man. In each head was a crooked black gash for a mouth. There were no eyes that Asher could see. Yet, these Things seemed to see one another, and emitted strange, chill, squeaking sounds!

As Asher watched, the Things sensed his presence. A half hundred of them rose and started toward him. They did not walk, nor did they crawl. Undulating, contorting strangely, they came on with incredible speed, long tentacles waving before them; slithering on the rocky floor of the cavern; making those odd squeaking noises.

As they neared him, Asher sprang to his feet, backing up against the pile of cavings beside the Miner. A long

tentacle whipped out and wrapped around his leg. A short, snout-tentacle quivered toward his face. There was strength beyond imagining in the grip on him.

With an almost animal snarl the man from the earth's surface moved to protect himself from these creatures, surely of the lowest living order. He grabbed into the pocket of his loose asbestos composition suit, and his fingers closed comfortingly around the static gun.

He aimed it, and the Thing gripping him was hurled back upon the others.

[Image description start. A black and white illustration, showing Asher, in a pressure suit, weilding a gun and firing it at one of the black, tentacled shapes attacking him. Image description end.]

Crackling, snapping viciously, the charges of

electricity that were drawn from the very earth increased in the gun and spumed out like lightning bolts. The Things squeaked excitedly and surged forward. Asher's finger pulled the ratchet trigger full force, and like dew before a strong shaft of sunlight, the gruesome Things were knocked away.

Hating the sight, Asher changed the charge of his gun, cutting the size of the path the volts covered, thereby increasing the potency of the discharge. The piled bodies sizzled, and to Asher's nose came a sulphurous smell. Then, there was nothing at all....

Sick, he put the gun back into the deep pocket and leaned on the wall. He turned around again to the pile of cavings that barred his way from the surface, and dug like a madman with his bare hands. The Miner was weighed down, and he could not use it anyhow. The blasting tubes were on the bottom, and could not be shifted to the top.

Suddenly he stopped his crazed work, raised his head and listened. "My God!" he gasped hoarsely, "am I stark mad?" He thought he must be, for the voice of a

human being came to his ears.

"You will be pleased, Blaine Asher, to turn around!
And do not make any foolish moves, I warn you."

"Lee Wong! Krenski!" Asher turned, face to face with the super-scientists of whom he had spoken to R. Briggs Johns the day before. Asher shook his head. More of the terrible dream, this meeting two humans down in the earth's core.

"Most right, honorable Asher." Lee Wong bowed mockingly. He and Krenski were garbed in loose-fitting garments of much the same style as Asher. In their hands, they carried static guns. Not the small gun, such as Asher had concealed in his pocket. More like heavy air drills, they were.

Asher frowned at the lamps they carried. He knew by the dazzling action of the rays that they were pressure lamps. But they gave off much better light than those of his own invention. They had gone him one better there.

"Did—did you see them?" Asher gulped. "And how—how did you get down here? Tell me!" He took a step toward Lee Wong, intending to lay his hand on the Chinaman, to make sure he was live flesh and blood, and not a figment of his disordered brain.

"Stand where you are!" Lee Wong snapped. He held the heavy static gun up and Asher felt a light charge tingle his body. "Those Things of which you speak—I assume you mean the Petrolia. Ah, yes, we see them. Every day, we see them. For us they work. They work, my dear Blaine Asher, tapping upward into the oil sands; sands that are burial places of countless millions of generations of Petrolia; of lost races that once ruled supreme over these underground worlds.

"How simple, to take the oil from below—the oil you want so much above. Someone must do the work. I and Krenski found the Petrolia ready and willing. Being creatures of feeling, with little sense, we were able to bend their dying wills to do our work. You see, we made them feel we would save them, a dying race, from extinction! They do our bidding."

Asher was bewildered by the enormity of the thing. "You mean these Things you have called Petrolia actually work for you? And that you saved them from becoming extinct?"

"Exactly," Lee Wong nodded, seeming to be enjoying himself. "Like humans of the surface, Petrolia live on the dead. I mean, wherever we get our living food from the earth, we plant our dead back in that earth. Petrolia are spawned in beds of petroleum. Just as eels seek deep water to lay their eggs, so do Petrolia go to the oil strata to spawn future tribes.

"When we pump out the oil, they have no—shall we say "hatching?"—beds. But now, by tapping and bringing down the oil, we have assured them more spawning pits. They will increase, and we have made them sense it. For that matter, the very oil they breed in, gives them sustenance. That is why they are black fleshed and blooded, and have suckers instead of mouths, as a black man is black through ages beneath hot suns.

"It's easy for us, who are wiser than other men, to

figure what oilfield might contain such people. We have a rapid elevator connecting us to the surface. And—"

"Then," Asher almost shouted, "I'm not trapped!"

"No?" Lee Wong wrinkled his forehead quizzically. "You should realize that we cannot allow you to go back to the surface—alive, or any other way. We intend to increase the Petrolia, spreading them to other underground, yet uninhabited worlds. You would spoil that.

"No, you will never return to the surface. They cannot haul your tube to the top, so they will think you perished in it. And"—Lee Wong shrugged—"it might have been better if you had, Mr.—"

"*I wouldn't!*" the yellow man snarled. He rolled the ratchet of his static gun and Asher was hurled to the floor by the heavy shock. Wisely, he stood up, keeping his hands well away from the pocket in which his own gun rested. He doubted whether his little static gun could compete with the guns of the others, but it was

something. They had not thought to search him—perhaps they might not. It was his only hope.

Lee Wong bowed low again, motioning Asher to go ahead. "Now you shall see what we have done. We are proud, and we know you can appreciate our workings. You will be glad to learn why we do as we are doing; you will be intrigued as a fellow scientist. Then, so sad to say, you must perish for having gained that very knowledge."

Asher shrugged, and through half-closed lids he eyed Lee Wong and the rather small, slender Krenski, of the high brow and large head. Then he walked ahead of them. Head up, shoulders back, he walked carelessly down the wide hall—a hall that led into the main cavern of that underground empire.

It was large—fully a hundred feet in a rough square. Not fifteen feet from floor to ceiling at any point, it followed the course of the two layers of granite between which it was sandwiched. Other long halls, or crevices, ran in every direction out of this main cavern. In the walls, in niches and cracks, the

superior pressure lamps had been placed, throwing a bright, eery light over it all.

Asher recoiled suddenly at the sight of hundreds of Petrolia that swarmed the hallways, and they seemed to sense another presence beside that of Lee Wong or Krenski. A choked, gurgling sound came from the Chinaman, and they disappeared down the halls, squeaking angrily as they went.

"Our control room," explained Lee Wong waving his hand about him. He pointed to a dozen twenty-four inch pipe-lines that ran along the low ceiling, coming from as many different halls into the room, but all going out the same large hall, larger than the rest. "There are the arteries of our system. There is the oil that is so—shall we say strangely?—missing in your wells." He smiled, a taunting, mocking light in his eyes.

"You well understand how we do it. Above us, just below the oil strata, is a steel, trough-shaped roof. The oil, tapped from below, drains into these, and then into these pipe-lines. If we were working from

above, now, we would run it to a central shaft, and pump it out. We do not want it on the surface, however."

"Then why in the name of hell do you want it?" Asher barked, a tense note of anger in his voice. "And what do you do with it?" These two were humans. At least, they were in man-form, if not in feeling. And the Petrolia could be handled. Asher was getting mad, and his fear ebbed.

"Come." Lee Wong led the way under the pipe-lines, down the large hall. Krenski, his heavy static gun ready, walked at Asher's back. They came out into another cavern that stretched beyond the powerful lights. The sound of their voices echoed like thunder of the drums of Thor, and Asher realized this cavern might stretch away in Stygian blackness for hundreds of miles.

Asher marveled, for the floor of this cavern dropped at least five feet below the level of the control room or incoming hallways, forming a natural reservoir. A reservoir for the big streams of oil that were pouring

into it from the pipe-lines.

The rumble of the oil as it came in and splashed out in a never-ending stream, and the rumble of the oil streams above them as the precious fluid flowed down into the plated drain roof, sounded like the tramp of the weary feet of the damned, as it echoed back and forth across the mighty cavern.

"Our storage." Lee Wong stood at the edge and explained. "Also, as you may see, a concentration incubator, or spawning bed and food storage for our Petrolia."

Blaine Asher looked again at the rippling oil at his feet. He choked brokenly and stepped back a pace. For the oil near the bank was alive! It rippled and splashed, teeming with life. By the strange alchemy of breeding in oil and living on oil as man lives on bread, that lake of oil was a mass of growing Petrolia. Millions—yes, countless billions—of them! Hideous, foul Things that would be turned loose with the rest in that nightmare world—that would be taken to other buried worlds to start new races.

"But why—why?" Asher almost screamed the words at Lee Wong.

"Petrolia will be our armies, protecting our underground wealth," Lee Wong answered him. "They will be our faithful workers, under no command but mine. For, even Krenski has not mastered the over-control it takes to handle them!

"Gradually, as happened to the field we are now under, all oil fields will go dry. We will be getting the oil from below, and putting it in storage in mother earth. Think, Blaine Asher, what it will mean!" There was a fanatical light in Lee Wong's beady eyes.

"A world without petroleum is a world without power. No oil for fuel; no gasoline, lubricants or by-products of any sort. No airplanes could fly; tanks, tractors, oil-burning trains and ships; mechanical appliances—nothing could run. We now take the oil from America. Later, when our Petrolia have increased and we have devised means of moving them, we will go to all oil-producing countries.

"We will secrete the oil and paralyze the world. Now, in Russia and China and India, our societies are organizing and growing. They will handle the weakened, powerless nations, and I shall be ruler of the universe, surface and beneath, with Krenski to aid me, you see. It is wonderful, is it not? And, knowing what you do, having seen what you have, could you call it impossible?"

Blaine Asher groaned. It was not impossible, he knew. Unreal; monstrous—but never impossible. A region of hideous Petrolia; a world stripped of automotive and mechanical power, its fuel held in the hands of a few, far underground—it was terrible to think of.

And Asher the only one who knew. The only one who could avert such a thing. The fate of an entire world was in his hands. And he would soon die.

Die? No! Blaine Asher swore silently to himself that no power in existence should keep him from destroying these two fiends. It had to be done!

He dared not fail.

"Wonderful, stupendous thing," he forced himself to smile. "I'd like to grasp the hand of the genius who devised and carried out such a wonderful thing."

He took a step toward Lee Wong, right hand extended, his left slipping toward the pocket where his own static gun rested.

Lee Wong extended his own right hand. Something in the chill, flint look of Asher's eyes must have warned him. Even as Asher's fingers closed around his hand, he tried to jerk back.

"Destroy him!" he cried out to Krenski.

Asher dropped to one knee, letting his static gun remain in his pocket. His left hand closed around Lee Wong's wrist as the Oriental tried to pull away. Krenski was bringing the heavy, cylinderlike gun up and aiming it at Asher.

Asher twisted on one knee, his teeth gritted, braced to receive the shock from the gun. He jerked Lee Wong's arm down, heaved and came to his feet.

Crying out, arms and legs flailing, the Chinaman catapulted toward Krenski—and just at the instant Krenski fired!

The sickening smell of cindered flesh was in Asher's nostrils as he turned and ran back up the main hallway. He glanced back over his shoulder as he ran, and shuddered at the black mass lying at Krenski's feet. Lee Wong was no more. Wide-eyed, the Russian stared at the thing at his feet. Then, with a fiendish shriek, turned and brought the gun into line on the fleeing Asher.

A crackling charge of electricity singed the back of Asher's head as he dove head first around the corner of the hall into the control cavern. He reasoned that Krenski had sent a full charge after him, and hope kindled higher in his breast. For Asher believed his smaller static weapon was as strong as that of the other. At that, it would be a test, and Asher dared not take chances.

He crouched in the door of another hallway, waiting. Cursing, Krenski dashed into the control cavern.

Asher brought his gun up and fired. But even as he pulled the trigger, a long tentacle reached from the dark crevice behind him and jerked his arm. His charge snapped by the Russian, warning the other that Asher, too, was dealing with powerful electric rays that meant death should they touch.

Asher yielded to the tug of the slimy, sulphur-smelling tentacle, letting it pull him into the crevice, the charges of Krenski's weapon crackling by him, leaving his skin dry, and a powdery sensation in his mouth.

In the shelter of the crevice, Asher turned his gun upon the Petrolia that gripped him. The tentacles fell away, fading to nothingness before the charges that showed quivery blue in the dark. Like catacombs, one crevice opened into another. Asher darted into the next crevice and edged cautiously toward the control cavern.

The angry buzzing and snapping of Krenski's weapon caused him to duck instinctively, although no deadly charges came his way.

"Oh, God!" he heard the Russian's high-pitched voice, agonized, wailing, "they're coming in—they're coming in!"

A squeaking and slithering, now greater than ever, rose above all other sounds. And Asher realized what Krenski meant. Lee Wong had said that only he could control the Petrolia. They were swarming into the control room now. That was what Krenski was shooting at.

The squeaking sounds came up the crevice in which Asher was and a cold, clammy sweat broke out all over him. He could blast a thousand of them into nothing. But by sheer force, more body than his light static gun could down, they would overwhelm him.

His mind raced swiftly. He remembered the location, out in the control room, of the cage elevator that ran to the surface. It had not been hurt by the glycerine blast that had trapped Asher. The elevator shaft from the control room was cased clear into the cavern floor, and the blast had not jarred this far.

He wheeled and sent another charge of static electricity into the crevice back of him, then lunged out into the control room. It would be his own weapon against Krenski's, and a chance to gain the bottom of the shaft.

Krenski—piled, charred heaps of the Petrolia around him, which had momentarily cleared the attack—was running across the control room. Like a seething wave, the foul Petrolia undulated from every crevice and hallway, coming in to fresh attack. The Russian, terror lending him speed, raced for the cage at the foot of the shaft that led to the surface. At the same time Asher ran out.

Nearly a hundred feet apart, on opposite sides of the cavern, they stopped. Krenski turned his heavy weapon toward Asher at the same time Asher sent his own gun crackling and snapping out blue, fiery flame.

Side-stepping, now crouching, now dodging to this side and that, they fought their strange duel. Asher's right arm was burned, his hair singed from his head, and his body jarred again and again as Krenski

touched him. Krenski, groaning through gritted teeth, suffered burns all over his chest and left leg.

As the Petrolia came on, and the lightning play of deadly electric charges continued, Asher made a discovery. He noticed that the rays, or charges, of the two guns, when they met in mid-air, caused blue flame, and that the charge went no farther.

It did it again. The two charges met, crackled to explosion in the air. Krenski, too, noticed it, and he also noticed that the Petrolia were almost upon them again. Coming on in a wave that could not be hurled back.

He looked at Asher, and met the dare in Asher's eyes. Straight at each other, neither moving, they shot their static charges. Neither would move: it was a challenge from Asher that Krenski had to meet. One of them would have to die before the other would be able to gain the cage in the shaft. There could be no compromise, and only one man at a time could go surfaceward. If they continued to dodge and fight, the Petrolia would overwhelm them.

Power against power, they fought it out.

Asher's finger tightened on his trigger release until it seemed the skin would split; then he caused his hand to tremble just enough to make his electric charges cover the space in which Krenski's charges traveled. Hissing, spitting, flashing explosions, giving off sounds and light like big explosions of flash powder, the charges met.

Asher tingled from head to foot, and thrilled to the very marvel of the thing. Two deadly beams of electricity, holding each other off!

In one long, continuous flash, the contact point of the charges began to shift. Closer and closer, as the force of superior charges cleaved through the other, the contact points neared Krenski. He saw death upon him, for in another instant, Asher's charges would hurl his own bolts back upon him. The smaller weapon of Blaine Asher, attracting more static electric currents by reason of having a small attracting battery inside, where the larger gun of the other depended upon magnets for attraction, was

triumphing.

Krenski's mustache and light beard singed and curled. He cried out, stepped back, throwing up his arms as death flashed through his body.

His gun playing about him, Asher raced toward the big valves and gates that shut off the drain of the pipe-lines. Burning, reeking of sulphur and burned leather, the Petrolia vanished before him. But, as he turned, the drainage system that was robbing the field shut off. They had blocked his way again!

Too many to blast away altogether, they pressed in. Asher leaped forward, feet kicking, left fist smashing out, static gun crackling as if to tell him that nothing could stop them. Tentacles gripped at him, the foul, stinking smell gagged him. But the squeaks of the Petrolia maddened him.

"Squeak, damn you!" Asher shouted wildly, kicking, shooting and hitting, gaining toward the shaft.

"Squeak—for all the damned Things that ever bred below the earth cannot stop one surface man!"

He burned and fought his way through and jumped into the cage as his gun electrocuted two of the Petrolia that tried to weave in after him. As he slammed the door, Asher was conscious that something was happening. He hesitated, just long enough to see the cavern start buckling and caving. The pressure of the oil, now shut off, was filling back toward the surface, creating a mighty pressure downward. The surface wells would produce man's power-fuel once more.

Asher slammed the door, turned on the power, and the cage shot upward.

A half hour later, those waiting on the floor of the derrick above the hole in which Asher had gone down, started. Asher, burned, wounded, blood streaming from his battered body, staggered in and collapsed at their feet.

“I can't believe it! Insane! Impossible! Yet, every well in this field has started producing again! And when we went to that old, abandoned wildcat well, we found the shaft opening! I had it covered up, as you

ordered."

R. Briggs Johns paced up and down the laboratory floor, talking to Asher, who had just arisen from his bed, two weeks after he had collapsed at their feet in the derrick. Still bandaged, he was a different Blaine Asher. His face was lined, and the hair next to his scalp nearly snow white.

"I'll be able to do some walking around outside in a few days," Asher declared as he cleaned a test tube and placed it in a rack. "I can locate several wells over that underground storage cavern, and you can recover that oil. But you can't mine this field.

"Twenty years, perhaps, and you can. But it will take that long for those Petrolia to die out. We've got to get the oil out from below to a point where they can no longer spawn. We will apply mining in other fields—but not here!"

"Not here," Johns repeated, shuddering.

"It's up to you to see no one else tries it." Asher lit a

cigarette and nodded at Johns. "Get control of the field—anything. Tell the oil men something. But don't tell them the truth. They wouldn't believe you. They would call you raving mad.

"The world does not know. It would not believe. Can we do other than remain silent?"

R. Briggs Johns, sick of thinking of the cavern world and horrible things below them, knew they could not.

#31 Giants Of The Ray, By Tom Curry:

Madly the three raced for their lives up the shaft of the radium mine, for behind them poured a stream of hideous monsters—giants of the ray!

- - -

"I tell you I'm not crazy," insisted the tall man.

"Durkin, they got a big mine."

Bill Durkin laughed roughly, and sneered openly at his partner, Frank Maget. "G'wan, you're drunk."

"Well, I was last night," admitted Maget. "But I'd slept it off this morning. I was lying under that table in the Portuguee's, and when I opened my eyes, there were these three birds sitting near me. They hadn't spotted me. I heard 'em talking of wealth, how their mine was

of unbelievable richness and greater than any other deposit in the world. Well, that means something, don't it?"

"That's all right," said Durkin. "But whoever saw a cricket fifteen inches long?"

"Listen. There were three of these guys. One was a hell of a looking fellow: his face was piebald, with purple spots. His skin was bleached and withered, and one eye looked like a pearl collar button! They called him Professor, too, Professor Gurlone. Well, he takes out this damn cricket thing and it was sort of reddish purple but alive, and as long as your forearm. This professor guy says his son had taken an ordinary cricket and made it grow into the one he had. But the mine was what interested me. I kept my mouth shut and my ears open, and it's in the Matto Grosso. May be emeralds, diamonds, or gold. Boy, I'm heading for it, right now. The old guy's going back to-morrow, get me?"

"It's a lot of bunk," growled Durkin, who was stout and red of countenance.

"Yeh? Well, Otto Ulrich don't put fifty thousand into bunk."

Durkin whistled. "You mean the German loosened up that much?" he asked, and his eyes showed interest.

"Sure. He paid this Gurlone fifty thousand dollars—credit, of course."

"Well—maybe there's something in the mine story. But boy, you were drunk when you saw that cricket. No cricket ever grew that big. You always see things when you get too much rum in you."

"The hell you say," cried Maget. "I saw it, I tell you!"

Durkin feigned elaborate politeness. "Oh, all right, Frank. Have it your own way. You saw a cricket that big and this Gurlone feller took a couple of pink elephants out of his pocket to pay the check. Sure, I believe you."

But money never failed to attract the two tropical tramps. They were looking for trouble, not work, and

the idea of a raid on a rich mine in the Matto Grosso was just what they would enjoy.

An hour later, they had cornered a small, inoffensive peon named Juan. Juan, Maget and Durkin had discovered, had come out of the wilderness with Professor Gurlone, the strange looking gentleman who spoke of a fabulously wealthy mine and commanded checks for fifty thousand dollars from a reputable banking firm. Such a man was worth watching.

The two rascals were expert at pumping the little half-breed. They knew peons, and the first thing that happened was that Durkin had slipped Juan several dollars and had pressed a large glass of whiskey on the little man.

The conversation was in broken English and Spanish.

"Quien sabe?"

Durkin and Maget had this phrase flung at them often during the course of the talk with Juan, and there

were many elaborate shrugs.

There was a mine, way back in the Matto Grosso, said Juan. He thought it might contain silver: there had been the shaft of an old mine there. But now they were deep down in the ground, digging out reddish brown ore, and the cavern smoked and smelled so badly a man could work but an hour or two before being relieved. But the pay was very high. Also, Juan, in his rambling way, spoke of grotesque animals. What were these creatures like? asked Durkin. Then came a shrug, and Juan said they were like nothing else on earth.

Durkin discounted the part of the story having to do with the strange animals. He thought it was peon superstition. But now he was sure there was a rich mine to be raided.

"It's a tough part of the Grosso," he said, turning to Maget.

"Sure. Hard to carry enough water and supplies to make it. Say, Juan, who was that big Portuguese with

Professor Gurlone? He's blind, ain't he? His eyes were white as milk, and his face tanned black as river mud. Surely is a great big guy, and tough looking, too."

Durkin drummed on the table, considering the matter, while Juan spoke of the big Portuguese. The swarthy man with the colorless blind eyes was Espinosa, former owner of the mine. He had sold part of his claim to the Gurlones, but had remained with them as an assistant. Though blind, he knew the depths of the mine and could feel his way about, and direct the peons in their labors.

"I've got it," said Durkin, turning back to Juan and Maget. "Juan, it's up to you. You've got to blaze the trail so we can follow you in. And you can steal food and cache it for use on the way, see? We'll come along a day or so after the Gurlones."

It took some persuading to make Juan consent to their plot, but the peon yielded at last to money and the promise of part of the spoils. "Maybe you can steal Gurlone's samples and they'll give us a line on what he's up to out there. Whether it's emeralds or

diamonds or gold that they're taking out of the mine."

Juan was stupid and superstitious, like most of his fellows. He had obeyed orders, digging out the red ore, and that was all he knew. But prompted by the two tramps, he was ready for trouble, too.

Juan told them that Professor Gurlone carried a small lead case which he seemed to prize greatly.

"Get it, then," ordered Durkin.

The two tramps saw Gurlone's party start on the morrow. There were many cases of supplies loaded into launches, some marked Glass, Acids, and so on. Then there were boxes of food and various things needed in a jungle camp.

Juan, their tool, was working with the other peons, and at ten o'clock in the morning the launches set out, pushing into the current of the Madeira.

Old Gurlone, of the livid face, was in charge of one boat, and the gigantic Portuguese, with his colorless

eyes and burned complexion, sat beside him.

That night, the two tropical tramps stole a small boat with a one-cylinder motor, and started up the river.

It was a hard journey, but they were used to river and jungle work, and the object they had in view was enough to make them discount trouble. They speculated upon what manner of treasure it was they would find in the cavern of the Matto Grosso mine. It might be precious stones, it might be gold. Certainly it was something very valuable.

They carried little supplies, but they were heavily armed. For food, they might hunt and also depend on the caches left by their friend, Juan the peon.

Three hundred miles from Manaus, they came to the landing where old Gurlone had unloaded his boats. The two tramps drew their own craft up on shore a quarter of a mile away, keeping out of sight, and hid the boat in dense brush. Then they crept up the river bank, keeping out of sight of the boatmen, who were preparing for the return voyage, and cut into the

jungle so as to strike the trail of the caravan ahead.

For several hours they followed the path easily. They found palm trees blazed with new marks, and these they were sure their friend Juan had left for them. But the trail was easy to keep without these. The supplies had been loaded on burros, which had been awaiting the boats.

That night, they camped beside a small stream. They were but twenty-four hours behind Professor Gurlone and his party, and the food Juan had cached for them was in good condition.

They were up at daybreak, and pressed on, armed to the teeth and ready for a fight.

"What's that?" said Durkin, stopping so suddenly that Maget ran into him.

They had been walking at a swift pace along the jungle path, the giant trees forming a canopy overhead. Monkeys screamed at them, birds flitted a hundred feet above them in the roof of the forest.

The sun beat on the jungle top, but few rays lightened the gloom beneath.

From up ahead sounded a frightful scream, followed by a long drawn out wailing. Maget glanced at Durkin, and the latter shrugged, and pressed on. But he gripped his rifle tightly, for the cries were eery.

From time to time the two stopped to catch better the direction of the wails. At last, they located the spot where the injured person lay.

It was under a great bombax tree, and on the shaded ground writhed a man. The two stopped, horrified at the squirming figure. The man was tearing at his face with his nails, and his countenance was bloody with long scratches.

He cursed and moaned in Spanish, and Durkin, approaching closer, recognized Juan the peon.

"Hey, Juan, what the hell's the matter? A snake bite you?"

The bronzed face of the sturdy little peon writhed in agony. He screamed in answer, he could not talk coherently. He mumbled, he groaned, but they could not catch his words.

At his side lay a small lead container, and closer, as though he had dropped it after extracting it from its case, lay a tube some six inches in length. It was a queer tube, for it seemed to be filled with smoky, pallid worms of light that writhed even as Juan writhed.

"What's the trouble?" asked Durkin gruffly, for he was alarmed at the behavior of the peon. It seemed to both tramps that the man must have gone mad.

They kept back from him, with ready guns. Juan shrieked, and it sounded as though he said he was burning up, in a great fire.

Suddenly the peon staggered to his feet; as he pushed himself up, his hands gripped the tube, and he clawed at his face.

Perplexity and horror were writ on the faces of the two tramps. Maget was struck with pity for the unfortunate peon, who seemed to be suffering the tortures of the damned. He was not a bad man, was Maget, but rather a weakling who had a run of bad luck and was under the thumb of Durkin, a really hard character. Durkin, while astounded at the actions of Juan, showed no pity.

Maget stepped forward, to try and comfort Juan; the peon struck out at him, and whirled around. But a few yards away was the bank of the stream, and Juan crashed into a black palm set with spines, caromed off it, and fell face downward into the water. The glass tube was smashed and the pieces fell into the stream.

"God, he must be blind," groaned Maget. "Poor guy, I've got to save him."

"The hell with him," growled Durkin. He grasped his partner's arm and stared curiously down at the dying peon.

"Let go, I'll pull him out," said Maget, trying to

wrench away from Durkin.

"He's done for. Why worry about a peon?" said Durkin. "Look at those fish!"

The muddy waters of the stream had parted, and dead fish were rising about the body of Juan. But not about the dying man so much as close to the spot where the broken tube had fallen. White bellies up, the fish died as though by magic.

"Let's—let's get the hell back to Manoas, Bill," said Maget in a sickly voice. "This—this is too much for me."

A nameless fear, which had been with Maget ever since the beginning of the venture, was growing more insistent.

"What?" cried Durkin. "Turn back now? The hell you say! That damn peon got into a fight with somebody and maybe got bit by a snake later. We'll go on and get that treasure."

"But—but what made those fish come up that way?" said Maget, his brows creased in perplexity.

Durkin shrugged. "What's the difference? We're O. K., ain't we?"

In spite of the stout man's bravado, it was evident that he, too, was disturbed at the strange happenings. He kept voicing aloud the question in his mind; what was in the queer tube?

But he forced Maget to go on. Without Juan, the peon, to leave them caches of food on the trail, they would have a difficult time getting provender, but both were trained jungle travelers and could find fruit and shoot enough game to keep them going.

Day after day they marched on, not far from the rear of the party before them. They took care to keep off Gurlone's heels, for they did not wish their presence to be discovered.

When they had been on the journey, which led them east, for four days, the two rascals came to a

waterless plateau, which stretched before them in dry perspective. Before they came to the end of this, they knew what real thirst was, and their tongues were black in their mouths before they caught the curling smoke of fires in the valley where they knew the mine must be.

"That's the mine," gasped Durkin, pointing to the smoke.

The sun was setting in golden splendor at their backs; they crept forward, using great boulders and piles of reddish earth, strange to them, for cover. Finally they reached the trail which led to the hills overlooking the valley, and a panorama spread before them which amazed them because of its elaborateness.

It seemed more like a stage scene than a wilderness picture. Straight ahead of them, as they lay flat on their stomachs and peered at the big camp, yawned the black mouth of a large cavern. This, they were sure, was the mine itself. Close by this mouth stood a stone hut. It was clear that this building had something to do with the ore, perhaps a refining

plant, Durkin suggested.

There were long barracks for the peons, inside a barbed wire enclosure, and they could see the little men lounging now about campfires, where frying food was being prepared. Also, there was a long, low building with many windows in it, and houses for supplies and for the use of the owners of the camp.

"Looks like they were ready in case of a fight," said Durkin at last. "That fence around the peons looks like they might be havin' trouble."

"Some camp," breathed Maget.

"We got to find somethin' to drink," said Durkin.

"Come on."

They worked their way about the rim of the valley, and in doing so caught glimpses of Professor Gurlone, the elderly man they had spotted in Manaos, and also saw the big Portuguese with his sightless eyes.

At the other side of the valley, they came on a spring

which flowed to the east and disappeared under ground farther down.

"Funny water, ain't it?" said Durkin, lying down on his stomach to suck up the milky water.

But they were not in any mood to be particular about the fluids they drank. The long dry march across the arid lands separating the camp from the rest of the world had taken all moisture from their throats.

Maget, drinking beside his partner, saw that the water glinted and sparkled, though the sun was below the opposite rim of the valley. It seemed that greenish, silvery specks danced in the milky fluid.

"Boy, that's good," Durkin finally found time to say, "I feel like I could fight a wildcat."

The water did, indeed, impart a feeling of exhilaration to the two tramps. They crept up close to the roof of the parallel shaft which they had seen from the other side of the valley, and looked down into the camp again.

Professor Gurlone of the livid face and Espinosa the blind Portuguese, were talking to a big man whose golden beard shone in the last rays of the sun.

"That's the old bird's son," said Durkin, "that Juan told us about. Young Gurlone."

A rumbling, pleasant laugh floated on the breeze, issuing from the big youth's throat. The wind was their way, now, and the valley breathed forth an unpleasant odor of chemicals and tainted meat.

"Funny place," said Maget. "Say, I got a hell of a headache, Bill."

"So've I," grunted Durkin. "Maybe that water ain't as good as it seemed at first."

They lay in a small hollow, watching the activity of the camp. The peons were in their pen, and it was evident that they were being watched by the owners of the camp.

As purple twilight fell across the strange land, the two

tramps began to notice the dull sounds which came to their ears from time to time.

"That's funny thunder," said Maget nervously. "If I didn't know it was thunder, I'd swear some big frogs were around here."

"Oh, hell. Maybe it's an earthquake," said Durkin irritably. "For God's sake, quit your bellyachin'. You've done nothin' but whine ever since we left Juan."

"Well, who could blame me—" began Maget. He broke off suddenly, the pique in his voice turned to a quiver of fear, as he grasped Durkin's arm. "Oh, look," he gasped.

Durkin, seeing his partner's eyes staring at a point directly behind him, leaped up and scrambled away, thinking that a snake must be about to strike him.

He turned round when he felt he was far enough away, and saw that the ground was moving near the spot where he had been lying.

The earth was heaving, as though ploughed by a giant share; a blunt, purplish head, which seemed too fearful to be really alive, showed through the broken ground, and a worm began to draw its purple length from the depths. It was no snake, but a gigantic angleworm, and as it came forth, foot after foot, the two watched with glazed eyes.

Maget swallowed. "I've seen 'em two feet long," he said. "But never like that."

Durkin, however, when he realized that the loathsome creature could not see them and was creeping blindly towards them with its ugly, fat body creasing and elongating, picked up rocks and began to destroy the monstrous worm. He cursed as he worked.

Dull red blood splattered them, and a fetid odor from the gashes caused them to retch, but they finally cut the thing in two, and then they moved away from there.

The dull rumblings beneath them frightened Maget, and Durkin too, though the latter tried to brazen it

out.

"Come on, it's gettin' dark. We can take a look in their mine now."

Maget, whimpering, followed. The booming sounds were increasing.

But Durkin slipped down the hillside, and Maget followed into the valley. They crept past the stone shack, which they noticed was padlocked heavily.

Durkin stopped suddenly, and cursed. "I've cut my foot," he said. "These damn shoes are gone, all right, from that march. But come on, never mind."

They crept to the mouth of the cavern and peered in. "Ugh," said Maget.

He drew back with a shudder. The floor of the mine was covered with a grey slush, in which were seething white masses of slugs weaving in the slime. A powerful, rotten odor breathed in their faces, as though they stood in the mouth of a great giant.

"Ah!" yelled Durkin, throwing his arms across his face.

The greenish, ghostly light which emanated from the slime was weaker than moonlight, just enough to see by; a vast shadow hovered above their heads, as though a gigantic bat flew there. The sweep and beat of great wings drove them back, and they fled in terror from such awful corruption.

But the flying monster, with a wing spread of eight feet, dashed past them, and silhouetted against the rising moon like a goblin. Then came another, and finally a flock of the big birds.

Durkin and Maget ran away, passing the stone house which stood near the cavern's mouth. The booming sounds from the bowels of the earth filled their ears now, and it was not thunder; no, it issued from the depths of the mine.

"We—we got to get somethin' to eat," said Durkin, as they paused near one of the shacks, in which shone a light.

Sounds of voices came from the interior. They crept closer, and listened outside the window. Inside, they could see Espinosa, Gurlone senior, and the big youth with the golden beard, Gurlone junior.

"Yes, father," the young man was saying. "I believe we had better leave, at once. It's getting dangerous. I've reached the five million mark now, with the new process, and it is ready to work with or sell, just as we wish."

"Hear that?" whispered Durkin triumphantly. "Five million!"

"It's all ready, in the stone house," said young Gurlone.

"Why should we leave now?" said old Gurlone, his livid face working. "Now, when we are just at the point of success in our great experiments? So far, while we have struck many creatures of abnormal growth, still, we have overcome them."

"Well, father, there is something in the mine now

which makes it too dangerous to work. That is, until they are put out of the way. You can hear them now."

The three inside the shack listened, and so did Durkin and Maget. The booming sounds swelled louder and the earth of the valley shook.

"I t'ink we better go," said Espinosa gruffly. "I agree with your son, Professor."

"No, no. We can conquer this, what ever it is."

"You see, father, while you were away, we broke through into a natural cavern, an underground river. It was then that the trouble started. You know the effect of the stuff on the insects and birds. It enlarged a cricket one hundred times. You saw that yourself. Six of the peons have disappeared—they didn't run away, either. They went down the shaft and never came back."

"Oh, they probably fell into the water and drowned," said old Gurlone impatiently. "Even if they did not, we can kill anything with these large bore rifles."

"We'd better pull out and let it alone for a while," said young Gurlone gravely. "The peons have been trying to bolt for several days. They'd be gone now if I hadn't penned them in and electrified the fence."

Maget put his hand on his friend's shoulder. "I'm starving," he whispered.

Durkin nodded, and they turned away, toward what they had marked as a supply shack. They heard a low murmur from the peons' pen, as they began to break off the hasps of the lock which held the door of the storehouse.

They got inside with little trouble, and began to feel about in the dark for food. They located biscuits and canned goods which they split open, and these they wolfed hungrily, listening carefully for sounds from outside.

"Here they come," said Maget, gripping Durkin's arm.

They looked out the window of the supply shack, and saw old Gurlone issue from the building outside which

the two tramps had been listening. In one hand, the old Professor, brave as a lion, carried an old fashioned double-barreled elephant gun, and the rays from a powerful electric torch shone across the barrel.

At least, they thought the bizarre figure was old Gurlone, from the size. For the man was clad in a black, shiny suit, and over his head was a flapping hood of the same material in which were large eyeholes of green glass. Behind this strange form came a larger one, armed also with a big bore rifle and with another powerful flashlight.

The blind Portuguese was armed, too, but he was not clad in the black suit. He took his stand beside the mouth of the cavern, and waited while the two Gurlones entered the mine.

"My foot hurts," said Durkin suddenly, breaking the silence.

"I'm going out and see what happens," said Maget.

Durkin limped after Maget, who now took the lead.

They crept close as possible to the mine opening, and saw the big Portuguese standing there in silence, listening carefully. Any sounds the two might have made were drowned in the great bellowing from within the cavern.

These noises, so like the croak of bullfrogs but magnified a thousand times, were terrifying to the heart.

The sweep of wings sounded on the night air, and Espinosa drew back and squatted close to the ground, as immense green creatures, flying on dusty wings, issued from the mine.

"God, those are moths," breathed Maget.

Yes, unmistakably, they were moths, as large as condors. The green ones, but for their size, were lunar moths, familiar enough to the two tramps. More bats came, disturbed by the entrance of the two Gurlones.

Durkin broke, then. "I'm—I'm—I guess you're right,

Maget," he whispered, in a terrified voice. "We should have never come. If my foot wasn't hurt, I'd start for the river now. Curse it, what a place!"

The booming, vast croaks filled the whole valley, reverberating through the hills. Wails sounded from the peon camp.

The big Portuguese was shouting to the Gurlones. "Come out, come out!"

Maget gripped his own rifle, and stood up, bravely. His fear, though it was great, seemed to have brought out the better side of the man, while Durkin, so brave at first, had cracked under the strain.

"Look out, they'll see you," whimpered Durkin.

Maget strode forward. A blast of fetid, stinking air struck his face, and he choked. The noises were now ear-splitting, but above the bellows came the sounds of the big rifles, the echoes booming through the recesses of the cavern.

Then the two Gurlones, running madly, burst from the mine entrance.

"Run," they screamed. "Run for your life, Espinosa!"

"I'll help you," cried Maget, and Durkin could detain him no longer.

The Gurlones hardly noticed the newcomer, as they ran madly towards the shelter of their houses.

Espinosa joined them, going swiftly in spite of his blind eyes.

The croaking made Maget's brain scream with the immensity of the sound. Luminous, white disks, three feet in diameter, glared at him, and the creature, which progressed with jerky leaps toward him, almost filled the mouth of the mine.

It was hot in pursuit of the fleeing Gurlones. It squatted and then jumped, and presently it was out in the night air.

Its form was that of a gigantic frog, but it stood some

twenty feet in height, and from its throat sounded the terrific bellowing which rivalled the thunder.

[Image description start: A black and white illustration showing a giant frog climbing out of the entrance to a mine while bats and moths fly above it,

and a tiny person flees in fear. Image description
end.]

Maget bravely stepped forward, and began to fire into the huge, soft body. The great mouth opened, and as the dum-dum bullets tore gashes in the blackish green batrachian, the thunderous croaks took on a note of pain.

The odor of the creature was horrible. Maget could scarcely draw his breath as he fired the contents of the magazine into the big animal. Two more jumps brought the frog almost to Maget's feet, and the tropical tramp felt a whiskerlike tentacle touch his face, and bad smelling slime covered him.

The frog was blind, without doubt, from its underground life, but the tentacles seemed to be the way it finally located its prey, for it turned on Maget and made a final snap at him. The great jaws closed like the flap of hell, and Maget leaped back with a cry of triumphant terror.

The bullets had finally stopped the big frog, but at its

heels came a strange, jellylike creature, not quite as bulky as the frog, but pushing along on its legs and with a tail some eight feet thick and fifteen feet in length. This, too, evidently a polywog, was blind, with whitened discs for eyes, but it slid along at a rapid rate because of its size. Maget's gun was empty; he turned so flee, but the polywog stopped and sniffed at the thick blood of its fellow. Then, to Maget's relief, it began to hungrily devour its companion.

Utterly filthy, and ferocious, the polywog in silence snapped great chunks from the dead giant frog.

"Hello. Who are you?"

Maget turned, having forgotten the amenities of life in the excitement. Professor Gurlone and his son, still clad in their black suits, but with their helmets off, were standing beside him, clutching their guns and lights.

The big Portuguese, Espinosa, appeared, and Durkin was beside him.

"Why," said Maget, between gasps, "we just happened to be out exploring, and we saw your camp. We were on our way in when we heard the noises and came to investigate."

"I see," said old Gurlone. "What made you head in this direction, and where's your outfit?"

"Oh, we cached most of it back there," said Maget.

"My partner's hurt his foot, so he can't walk well. Isn't that so, Durkin?"

"Yeh," growled Durkin. "I got a sore foot, all right."

Old Gurlone was suspicious of the vague story which Maget and Durkin concocted as the explanation of their presence in the valley. But evidently the Professor was too worried about the situation in which he and his friends were, to question the two tramps very closely. In fact, he seemed rather glad that he had two more pairs of hands to aid him and he thanked Maget for his bravery.

They dispatched the great polywog as it tore its

parent to bits, and then the five men, the two Gurlones, Espinoza, Maget, and the limping, cursing Durkin, retired to one of the shacks.

The living quarters of the Gurlones was quite elaborate. There were many books on rough shelves, and there was a small bench filled with glass phials and chemicals, though the main laboratory was in one of the long buildings.

Professor Gurlone poured drinks for the five, and welcomed Durkin and Maget as allies.

"We'll need every man we can get, if we are to cope with these great creatures," said old Gurlone. "The peons are too frightened to be of use. Luckily, it was a frog we came upon on the banks of the subterranean river. There is no telling how many more creatures of the same or greater size may be down there. We will have to destroy them, every one."

Maget and Durkin shuddered. "Say," blurted Durkin, his face working nervously, "how the hell did that frog get so big? I thought I was seein' things, Professor."

"No, no," said Professor Gurlone. "You see, the ore in the mine contains radium, that is, salts of radium. It is a pitchblende deposit, and it happens to be so rich in radium content that throughout the ages it has affected all the life in the cavern. The arid land surrounding the ore—this has been, generally, one of the characteristics of radium deposits—has kept most of the jungle creatures away, but underground beings such as reptiles, worms and frogs, have gradually become immune to the effects of the ore and have grown prodigiously and abnormally under the stimulation of the rays given off by the radium.

"Now, this is nothing strange in itself, but never before has such a rich deposit been discovered, so that the amounts of radium available have been too small to really check its effect on growth in animals. That is our chief scientific object in coming here: we realized, from Senor Espinosa's description of the played-out silver mine he had, and from his loss of sight, that he had stumbled upon a valuable deposit of radium. It usually occurs with silver, that is, the uranium mother ore does, through the disintegration

of which radium is formed. The content of radium per ton in this ore proved unbelievably rich: we were delighted. I have always suspected that the animal cell might be stimulated into abnormal growth by exposure to radium salts, for such a thing already has been hinted at in the scientific world. Not till our chance came here, however, has enough radium been available for the experiments."

Maget and Durkin listened with open mouths. Radium meant but vague things to them. They had heard of radium paint which shone in the dark on the dials of watches and clothes, but of the properties of the metal and its salts they were utterly ignorant.

"That radium stuff is what makes the funny light in that mine, then?" asked Maget.

"Exactly. The radio-activity of the elements in the ore give off the light. There are three rays, the alpha, beta and gamma, and—"

The professor forgot himself in a lecture on the properties of radium.

Durkin, breaking in, asked, slyly. "Is this radium worth as much as silver?"

Young Kenneth Gurlone laughed, and even old Professor Gurlone smiled. "Radium is worth more than gold or diamonds or platinum. Its value is fabulous. We have five million dollars worth already, in the form of the chloride."

"Whew," whistled Durkin.

He glanced sidewise at Maget.

"Yes," said Professor Gurlone, "five million dollars worth of it! Those great monsters who have been developed throughout the ages by the action of the radium rays on their bodies, causing them to grow so prodigiously, are but incidents. We must destroy them, so that our work cannot be interfered with. We must use dynamite, blow them to bits. They are powerful enough to crush the stone bank by the mine mouth and ruin the labors of the past two years, gentlemen."

Armed, and once more fortified with whiskey, the five made their way outside. The moon was darkened by an immense shadow, as one of the giant bats winged its way over their heads. But there were no more monster frogs. The ugly, bulky shapes of the dead polywog and its parent lay before them.

"We are safe for the moment," said Professor Gurlone. "Go and quiet the peons, Espinosa: they will listen to you."

The peons still wailed in terror; the blind Espinosa slipped silently away.

"Come," said Professor Gurlone, to his son and to Maget and Durkin. "I will show you the laboratory, so that you can understand better the effects of radium on growth."

The professor led them to the long, low, many-windowed building nearby, and flooded it with light. It contained cage after cage in which were monkeys, pumas, and various jungle folk. These creatures set up a chattering and howling at the light and

intruders.

Maget glanced curiously about him. He saw shining vials and glassware of queer shapes on long black tables, and tubes of chemicals. There were immense screens of dull lead. "Those are for protection," said Professor Gurlone, "as are the lead-cloth suits we wear. Otherwise we would be burned by radium rays."

Maget looked about, to see if his partner was listening, but he had gone away.

However, Maget was intensely interested. He went from cage to cage as Professor Gurlone, rather in the manner of a man giving a lecture to students, pointed out animal after animal that had been treated by the radium.

"This," said the professor, "is a monkey which usually attains a height of two feet. You can see for yourself that it is now larger than a gorilla."

The horrible, malformed creature bared its teeth and shook its bars in rage, but it was weak, evidently,

from the treatment accorded it. Its hair was burned off in spots, and its eyes were almost white.

There was a jaguar, and this beast seemed to have burst its skin in its effort to grow as large as three of its kind.

"You see, we have not so much time as nature," said Professor Gurlone. "These beasts cannot be enlarged too rapidly, or they would die. They must be protected from the direct rays of the radium, which is refined. In the ore, the action is more gradual and gentle, since it is less concentrated. But the metal itself would burn the vital organs out of these creatures, cause them to be struck blind, shrivel them up inside and kill them in a few minutes in the quantity we have. We expose them bit by bit, allowing more and more time as they begin to grow immune to the rays. Here, you see, are smaller creatures which have grown some eight or ten times beyond normal size."

All the animals seemed the worse for wear. Maget, his brain reeling, yet was beginning to grasp what radium did to one. It was not gold that you could pick

up and carry away.

"If a man touched that radium," he asked, "what would happen to him?"

"Just what I said would happen to the animals if we did not give it to them gradually," said Gurlone, with a wave of his hand. "It would kill him, strike him down as though by invisible poison gas. His heart and lungs would cease to function, pernicious anemia would set in, as the red corpuscles in his blood perished by millions. He would be struck blind, fall down and die in agony."

To Maget came the picture of the unfortunate Juan. As though answering his unasked question, Professor Gurlone went on. "We had a peon coming up with us," he said. "His name was Juan. He stole my sample-case, which contained an ounce of radium chloride, and ran off with it. If he opens it, it will kill him in just that way."

Maget shivered. "But—but didn't it hurt you to carry it?" he asked.

"No. For it was incased in a lead container some two inches in thickness, and the rays cannot penetrate such a depth of lead. They are trapped in the metal."

"Father, father, you're wasting time," broke in Kenneth Gurlone, shaking his yellow head. "We must act at once. The peons are almost mad with fear. Even Espinosa cannot quiet them. And every moment is precious, for the monsters may break forth."

But Maget was looking nervously about for Durkin. Where was he? Durkin had his mind on the treasure, and—

As they turned toward the door, the professor saying. "The rays from the ore, which is not so concentrated as the purified metal, do not kill—" Durkin suddenly appeared.

He carried his rifle at his hip, and he limped and cursed angrily. "Come across," shouted Durkin. "Give me the key to that stone house. Snap into it, and no argument."

"The key—to the stone bank?" repeated old Gurlone.

"Yes. I'll give you five counts to throw it over—then I'll shoot you and take it," snarled Durkin savagely. "I want that treasure, whatever it is, and I'll have it. One ... two ... three...." The tramp sent a shot over their heads as a warning.

"Hey, Bill, easy, easy," pleaded Maget. "That stuff is radium. It'll ruin you, boy!"

"Shut up, you yellor-bellied bum," snarled Durkin. "Four...."

A tinkle of metal came on the stone floor of the laboratory, as old Gurlone tossed his keys to Durkin.

"Don't go in that shack," cried young Gurlone. "It'll be your death, man—"

"Liars," yelled Durkin, and backed out the door.

"H'm," said old Gurlone, turning to Maget. "So you came to rob us, eh?"

But Maget thought of Juan, and then he knew he did not want Durkin, in spite of his failings, to perish so. He ran for the door, and across the clearing.

"Durkin—Bill—wait, it's Frank—"

Great bellowings sounded from the bowels of the earth, but Maget ignored these in his effort to save his partner. Durkin had the padlock off the stone shack, and pulled back the door.

As the door disclosed the interior, Maget could see that a greenish haze filled the entire building. Wan liquid light streamed forth like heavy fluid.

Bravely, to save his pal from death, Maget ran forward. But Durkin had entered the stone shack.

Maget went to the very door of the building. Durkin was inside, and Maget could see his partner's thick form as a black object in the strange, thick air.

An eery scream came suddenly from Durkin's lips; Maget wrung his hands and called for help.

"Come out, Bill, come out," he cried.

Durkin evidently tried to obey, for he turned toward the door. But his knees seemed to give way beneath him, he threw his arm across his eyes as he sank to the ground, crying in agony, incoherent sounds issuing from his lips.

Shriek after shriek the unfortunate man uttered. As Maget made a dash forward to take a chance with death and rescue his friend, Professor Gurlone and his son Kenneth ran up and threw a black cloak over the tramp.

The three entered the shack of death. Maget, not entirely covered, felt his heart give a terrific jump, and he gasped for breath. Durkin was quivering on the floor which was lined with lead.

Round vials stood about the room like a battery of search-lights, and from these emanated the deadly green haze.

But almost before Maget touched his pal, Durkin was

dead. Curled up as though sewed together by heavy cords. Durkin lay in a ball, a shaking mass of burned flesh.

The two Gurlones pushed out ahead of them, and raised their hands. They had on their black suits and their helmets.

"It is too late to do anything for him now," said Kenneth Gurlone sadly. "He was headstrong. You can see for yourself that the five million dollars takes care of itself. Certain death goes with it if you are unprotected. These lead-cloth suits will keep off the rays for a short time. We always wear them when we are working with the metal, even when we have a lead screen."

"Poor Bill," sobbed Maget. "It's terrible!"

Professor Gurlone shrugged. "It was his own fault. He was a thief and he would not let us stop him. I hope it's been a lesson to you, Maget."

"Yes, I want to help you," said Maget. "If you'll keep

me with you, I'll work for you and be straight. Give me a chance."

"Good. Then shake hands on it," said Kenneth, and they clasped hands firmly.

Espinosa appeared from the darkness. "The peons are mad with terror," he said morosely. "They cannot be held much longer. They will revolt."

"Well, we must kill the creatures in the cavern: that will quiet them more than anything else," said Professor Gurlone.

"Better close the stone shack," said Kenneth.

But as he spoke, a vast shape, another giant frog, appeared in the entrance of the shaft.

"Get some dynamite and fuses," ordered Professor Gurlone quietly. "Come on Kenneth, and you, Maget, if you care to risk your life. You need not do so unless you wish to."

Bravely, the older man led the way towards the croaking monster. The ground shook at its approach. It was heading for the bodies of the dead frog and polywog, bent on a search for food. Evidently these vast creatures were forced to prey upon one another for sustenance.

The rifles spoke, and Maget and the professor, in their black suits, protected by the lead-cloth and helmets from the rays, advanced. They poured bullet after bullet into the frog.

Kenneth came running to join them, and Espinosa stood by. Kenneth had dynamite bombs with fuses ready for lighting and throwing. He also brought more ammunition, and the three armed themselves to the teeth.

It was well after midnight when they started into the mine. They knew they must act quickly or retreat, for the bellowing sounded nearer and nearer the surface of the earth.

Each man carried big, powerful flashlights, and the

three entered the mine shaft and walked across the seething slugs into the bowels of the earth.

"Stay close together," ordered old Gurlone.

The mine was easy to descend for the first hundred yards. It led in a gentle slope downward. The way, save for a few giant bats and moths, and the big maggots, was clear. The greenish haze, not so bright as that in the death shack, enveloped them, but they needed their flashes to see clearly.

"Slowly, take it easy," counseled old Gurlone.

The mine spread out now, and began a steeper descent. The air was poor, and it was hard to breathe through the mask. Maget, his heart thumping mightily, listened to the roaring within the depths of the mine.

Now the ground seemed to drop away before them. Maget could hear the running of water, the underground river, and every now and then there came an immense splash, as if some great whale had

thrown itself about in the water.

A terrifically loud hissing filled their ears, and suddenly, before them, showed an utterly white snake with a head as big as a barrel. Its white eyes glared sightlessly, but its tongue stuck forth for several feet.

Kenneth Gurlone coolly tossed a lighted bomb at the creature: the explosion shattered their ear-drums, but it also smashed the serpent.

The writhing, wriggling coils, bigger than the body of a horse, slashed about, dangerously near. They picked themselves up, and pushed on, keeping close to the right wall.

A great bat smashed against Maget, and knocked the light out of his hand, but the blow was a glancing one, and he was able to retrieve his light and hurry on.

They were far from the entrance now. The hole which had been broken through by the peons showed before them, and they could see milky water dashing over black rocks.

Pallid eyes looked at them, and they knew they gazed upon another of the giant frogs. They tossed a bomb at the creature, and blew a jagged hole in his back. No sooner had he begun to die than there came a sudden rush of other monsters and a feast began.

"Throw, all together," yelled Kenneth Gurlone.

Into the vast mass of creatures, who crowded one another in the river for their share of the spoils, they threw bomb after bomb. The dynamite deafened them, and acrid fumes choked them, but they fired their rifles at the prodigious animals and there, in the big river cavern, was a seething mass of horrible life, dying in agony.

The bellowings and hissings sounded louder, so loud that the earth shook as if actuated by a mighty earthquake.

Maget gripped Kenneth Gurlone's arm. "My bombs are gone," he shouted.

He had but a few rounds of ammunition left, and still

more of the giant reptiles appeared. A centipede with its creeping, horrible legs topped the mass of squirming matter; they could see the terrific sting of the creature, so deadly when but a fraction of an inch long, and which was now at least a foot, armed with poison.

There came the rush of more bats and moths, a rush that threw the three men off their feet.

"We must have opened the hole more with our bombs," shrieked old Gurlone. "The dead bodies attract the other creatures, more and more of them are coming. It is impossible; we cannot deal with them all."

The vast gobbling of the great animals in the river below them was so prodigious they could not grasp it. It seemed it must be optical illusion. In a few moments, the dead had been eaten, swallowed whole, and fights were progressing between the victors.

They tossed the rest of their bombs, fired the remaining ammunition, and as they prepared to

retreat, several of the big creatures slopped over and started up the river bank into the mine shaft.

They ran for their lives, the three. Madly, with the earth shaking behind them as they were pursued by a hopping monster of a beetle with immense mandibles reaching out at them, they dashed for the open air.

Giant moths and bats struck at them, and Maget fell down several times before he reached the outside, and he was bruised and out of breath.

"Come on, there are too many to fight," gasped old Gurlone, throwing off the lead suit.

But there was no need to talk. The creatures, disturbed by the bombs, had collected in one spot and, shown the way out by one of their number, were coming.

Espinosa, with Kenneth Gurlone holding his hand, ran swiftly for the hills surrounding the valley. Maget helped old Professor Gurlone, who was so out of breath that he could scarcely move.

The great beetle which had been pursuing them was the first to break forth into the valley. Turning back for a look over his shoulder, Maget saw the thing pause, but the cavern belched forth a vast array of monsters, the beasts roaring, hissing, bellowing, in an increasing mass of sound.

They swarmed over the ground, and giant bats and moths winged their way about the heads of the monsters.

At the rim of the valley, the four men paused.

"God help the peons," said Kenneth Gurlone.

Now the horde of monsters swelled more and more; the bats and moths winged in mad frenzy about the open door of the radium shack. There were great beetles, centipedes, ants, crickets, hopping, crawling things, and grotesquely immense in size. Fights progressed here and there, but the majority of them were carried along in the sweep of the multitude.

"See, the radium kills those who get too close," said

Professor Gurlone, in a hushed voice.

The giant moths and bats were unable to withstand the lure of the green light. They flew with mad beatings of wings straight for the open door of the death house, and many of the great creatures, attracted by the light and urged on by an unexplainable force which sent them to death like gnats and moths in a flame, crowded near to the death-dealing radium.

Not until the whole shack was covered with quivering forms of the dead, did the other creatures veer off and with hops, creepings and myriad giant legs, begin to cover the whole valley.

The stone walls of the death shack had crumpled in with the weight; the other buildings, more lightly built, gave at once, with crackings and crashings.

The four men were powerless to assist the unfortunate peons, who were trapped in their barracks. The charged wires stopped many of the big beasts, but soon the electric light was short-circuited,

and the valley, in the moonlight, was a seething mass of fighting, dying, feasting monsters.

Other sounds, besides those made by the big creatures, came to the ears of the stricken men on the hillside. The breaking of glass, the cries of the jungle animals trapped in their cages, the shrieks of dying peons who were eaten at a gulp by the big frogs or stung to death, impaled on the mandibles of some great stinging centipede.

In the spot where the radium death shack had been, was a pulpy mass of livid, smoky light.

Now the bowl of the valley was filled as by some vast jelly. The creatures were slopping over the walls, and battling together.

The shambles was not yet over, but the four could remain no longer. They made their way down the hillside and struck out across the arid lands.

Maget, the tramp, became the leader. He was a trained jungle man, and it was he who finally brought

them safely to the Madeira.

He was their strong man, the one who found the trail and located roots and fruit for the party to subsist on. They nearly perished in the trip for lack of water, but again, Maget was able to supply them with roots which kept them from dying in agony.

They lay upon the river bank now, exhausted but alive. Maget had assisted old Gurlone, acted as his staff, half carried him the last miles of the trip.

Their clothes were almost gone, they were burned to crisps by the tropic sun. Flies and other insects had taken their toll. But Maget had brought them through.

The tall, thin fellow's hair had turned utterly white. But so had his soul.

"You're a good man, Maget," said Professor Gurlone. "You have saved us, and you have been brave as a lion."

Maget shook his head. "Professor," he said. "I came into the jungle to rob you. Durkin and I bribed Juan to steal that radium, and I feel responsible for his death. We thought you had diamonds or gold in the Matto Grosso, and we were after it. That's why I am here."

"You have repaid your debt to us, more than fully," said Kenneth, holding out his hand.

"Yes," said Espinosa.

"Will you keep me with you, then?" asked Maget anxiously. "Are—will you go back there?"

Professor Gurlone stared at him, and then said, in a surprised tone, "Why, of course!"

"But the monsters?" asked Maget.

"Many of them will die in the outer air," said Gurlone. "The survivors of the battles will start eating the dead. They will finally clear away the debris of dead creatures about the radium shack. As each is exposed to the rays of the concentrated metal, it will die. The

others will eat it, and be killed in turn. Thus, they will be destroyed. If there are any survivors after this evident turn of events, then we will cope with them when we return, reinforced. Dynamite, enough of it, will finish them off. And, Maget, in your next pursuit after knowledge of strange things, you may get a few earthly riches. The radium is still there, and you will share in it."

"Thank you," said Maget humbly. "I'm with you to the end."

"You must keep quiet about this," cautioned Kenneth Gurlone. "We do not want the world to know too much of our vast store of radium. It would attract adventurers and we would be annoyed by ignorant men. But we're thankful you lay drunk in that saloon when my father spoke of the millions, Maget."

In Manzos, Maget found himself a changed man. To his surprise, in spite of his white hair, brought on by the horror of what he had seen, he found that he had gained two inches in height, and that he was larger of girth. This, Professor Gurlone told him, was the effect

of the radium rays.

Never again did Maget lie drunk on the floor of a saloon. The events through which he had gone had seared the tramp's soul, and he kept close to his new master, Professor Gurlone.

#32 The Moon Master, By Charles Willard Diffin:

Through infinite deeps of space Jerry Foster hurtles to the moon—only to be trapped by a barbaric race and offered as a living sacrifice to Oong, their loathsome, hypnotic god.

Aproximate word count: 22,200

- - -

"Now that's a mighty queer noise." Jerry Foster told himself. He dropped the pack from his shoulders and leaned closer to the canyon rim.

Miles behind him was the last beaten trail: Jerry wanted peace and solitude and quiet. And now the quiet of the silent mountains was disturbed.

From far below came a steady, muffled roar. Faint it was, and distant, but peculiar in its unvarying,

unceasing rush.

"Not water," Jerry concluded; "not enough down there. Sounds like—like a wind—like a wind that can't quit.

"Oh well—" He shrugged his shoulders and slipped into the straps of his pack. Then he went back again to the granite ledge. "I wonder if there's a way down," he said.

There was, but it took all of Jerry's strength to see him safely through. On a fan-shaped talus of spreading boulders he stopped. There was a limestone wall beyond. And at its base, from a crevice that was almost a cave, came a furious rush of air and steam.

It touched him lightly a hundred feet away, and he threw himself flat to escape the hot blast. Endlessly it came, with its soft, rushing roar, a ceaseless, scorching blast from the cold rocks.

"That's almighty funny," mused Foster, and sniffed the

air. There was no odor.

"And is it hot!" he said. "Nothing like that in my geology book. And what is beyond? Looks like concrete work, as if someone had plastered up the cave." He picked his way quickly across the rock slope.

It was hard going. Below him the rocks and dirt went steep to the canyon floor. At its foot the blast swept diagonally over the slope. He must see what lay beyond....

"Curious," he thought; "curious if that is nature's work—and a lot more so if it isn't."

A rock rolled beneath his feet. Another! He scrambled and fought desperately for foothold in the slipping earth. Then, rolling and clawing, he rode helpless on the slide straight toward the mysterious blast. He felt it envelop him, hot and strangling. His lungs were dry and burning ... the blazing sun faded from the rocks ... the world was dark....

Darkness was still about him when he awoke. But it was cool; the air was sweet on his lips. And it was not entirely dark.

He turned his head. He was in a room. On a rough-hewn table a candle was burning. Its light cast flickering shadows on walls of stone. Rumbling in his ears was the sound of the blast that had overwhelmed him. It echoed, seemingly, from far back in the stone cliff.

Jerry made a move to sit up. He found that his hands and feet were tied, his body bound to the rough board bed.

At the sound of his stirring, a figure came out from the farther shadow. It was that of a man. Jerry looked at him in silence. He was tall, his thin erectness making him seem abnormal in the low room. The lean face was unshaven, and from under a thatch of black hair a pair of deep-set eyes stared penetratingly at the figure on the rude bed.

"Well," asked Jerry, at length, "what's the big idea?"

There was no reply. Only the intent, staring eyes.

"You got me out of that man-trap of yours," Jerry continued. "You saved my life."

The tall man finally spoke. "Yes, I saved your life. You missed the hottest part of the exhaust. I pumped you full of oxygen."

"Then why tie me up like this?" Jerry Foster was frankly puzzled.

"You are lucky to be alive. Spies are not always allowed—" He interrupted himself abruptly. "You are a reporter," he stated.

"Wrong," said Jerry Foster.

"Who sent you?"

"Nobody sent me. I heard the noise of your infernal blast-furnace and came down to have a look."

"Who sent you?" repeated the man. "Goodwin? The

Stillwater crowd? Who was it?"

"I don't know what you are talking about," protested Jerry. "I don't know who your Goodwin or Stillwater people are. I don't know who you are—I don't give a damn. Take these ropes off and cut out the melodrama. I'll go on my way, and I don't care if I never see you again."

"That's a lie." The tall figure leaned over to shake a bony fist. "You'd report to Goodwin. He stole my last invention. He'll not get this."

Jerry considered the wild figure carefully. "He's a nut," he thought. When he spoke, his voice was controlled.

"Now, see here," he said: "I don't know anything about this. I'm Jerry Foster, live in San Francisco—"

"So does Goodwin."

"Confound you and your Goodwin! So do a million other people live there! I'm getting away from there;

I'm heading into the hills for a short vacation. All I want is to get away from the world. I'm looking for a little peace and quiet."

The thin man interrupted with a harsh laugh.

"Come here spying," he said, "and tell me you want to get away from the world." Again he laughed shrilly.

"And I am going to be your little fairy godmother. I wish you were Goodwin himself! I wish I had him here. But you'll get your wish—you'll get your wish. You'll leave the world, you shall, indeed."

He rocked back and forth with appreciation of his humor.

"Didn't know I was all ready to leave, did you? All packed and ready to go. Supplies all stowed away; enough energy stored to carry me millions of miles. Or maybe you did know—maybe there are others coming...." He hurried across the room to open a heavy door of split logs in the rock wall.

"I'll fool them all this time," he said; "and you'll never go back to tell them." The door closed behind him.

"Crazy as a bed-bug," Jerry told himself. He strained frantically at the ropes that bound him. "Looks bad for me: the old bird said I'd never go back. Well, what if I die now ... or six months from now? Though I know that doctor was wrong."

He tried to accept his fate philosophically, but the will to live was strong. And one of his wrists felt looser in its bonds.

Across the room his pack lay on the floor, and in it was a heavy forty-five. If he could get the pistol.... A knot pulled loose under his twisting fingers. One hand was free. He worked feverishly at the other wrist.

The ropes were suddenly loose. He pulled himself to his feet, took a moment to regain control of cramped muscles, then flung himself at the pack. When the heavy door opened he was behind it, his pistol in his hand.

There was no struggle: the lanky figure showed no maniacal fury. Instead, the man did a surprising thing. He sank weakly upon the rough bunk where Jerry had lain, his face buried in his thin hands.

"I should have let you die," he said slowly, hopelessly. "I should have let you die. But I couldn't do that.... And now you'll steal my invention for Goodwin."

Jerry was as exasperated as he was amazed.

"I told you," he almost shouted. "I never knew anyone named Goodwin! I don't care a hoot about your invention. And as for letting me die—why didn't you? That's a puzzle: you were about to kill me, anyway."

"No," said the other patiently. "I wasn't going to kill you."

"You said I'd never go back."

"I was going to take you with me."

"Take me where?"

"To the moon," said the drooping figure.

Jerry Foster stared, open-mouthed. The pistol lagged in his limp hand. "To the moon!" he gasped.

Then: "See here," he said firmly. "I've got you where I want you."—he held the pistol steady—"and now I'm going to learn what's back of this. I think you are crazy, absolutely crazy. But, tell me, who are you? What do you think you're doing? What was the meaning of that roaring blast?"

The man looked up. "You don't know?" he asked eagerly. "You really don't?"

"No," said Jerry; "but I'm going to find out."

"Yes," the other agreed. "Yes, you can, now that you've got the upper-hand. I guess I was half crazy when I thought I had been spied out. But I'll tell you."

He sat erect. "I am Thomas J. Winslow," he said, and made the statement as if it were an explanation in itself.

"Well," said Jerry, "that's no burst of illumination to my ignorance. Come again."

The man called Winslow was ready—anxious—to talk.

"I am an inventor. I have made millions of dollars"—Jerry looked at the disheveled apparel of the speaker and smiled—"for other people. The Stillwater syndicate stole my valveless motor. Then I developed my television set. Goodwin beat me out of that: he will have it on the market inside of a year. I swore they should never profit by this, my greatest invention."

Jerry was impressed in spite of himself by the man's earnest simplicity.

"What is it?" he asked.

"I've broken the atom," said Winslow. "First tore the atoms of hydrogen and oxygen apart—dissociated them in the molecule of water—and have resolved them into their energy components. That's what you heard—the reaction. It is self-sustaining, exothermic. That hot blast carried off the heat of my retort."

Winslow rose from the bunk. Gone was his listless despondency.

"Put up that gun," he said: "you don't need it now. I think we understand each other better than we did." He crossed with quick strides to the door leading into the cliff.

"Come with me," he told Foster. "I am leaving to-day. You will not stop me. But before I go I will show you something no other man than myself has ever seen."

He led the way through the doorway. There was another room beyond, Jerry saw. It was a cave. Plainly Winslow had taken these caves in the rocks and had made of them a laboratory.

A lantern gave scant illumination: Jerry made out a small electric generator, and that was all. He felt a keen disappointment. Somehow this thin-faced man had communicated to him something of his own belief, his own earnestness.

"What kind of a laboratory do you call this?" he

demanded. But the other was busy.

In the wall an opening had been closed with a small iron door, with cement around it. Winslow opened it and reached through. He was evidently adjusting something.

The little dynamo began to hum. There was a crackling hiss from beyond the iron doorway. The opening was flooded with a clear blue light.

Then the roar began. It was tremendous, deafening, in the echoing cave.

"You may look now," said Winslow, and stood aside.

Jerry peered through. There was another cave beyond. In it was a small metal cylinder, a retort of some kind. The blue light came from a crooked bulb beyond. The retort itself was white-hot, despite a stream of water flowing upon it. A cloud of steam drove continuously out and up through a crevice in the rocks.

The water flowed steadily from some subterranean stream in the limestone formation. It was diverted for its cooling purposes, but a portion also flowed continuously into the retort. Jerry's eyes found this, and he could see nothing else. For, before his eyes, the impossible was occurring.

The retort was small, a couple of feet in diameter. It had no discharge pipes, could hold but a few gallons. Yet into it, in a steady stream, flowed the icy water. Gallons, hundreds of gallons, flowing and flowing, endlessly, into a reservoir which could never hold it.

The inventor watched Foster with complacent satisfaction.

"Where does it go?" Jerry asked incredulously.

"Into nothingness," was the reply. "Or nearly that!"

"See?" He held up a flask of pale green liquid. "And this," he added, exhibiting another that was colorless.

"I have worked here for many months. I have

converted thousands of thousands of gallons of water. It has flowed into that retort, never to return. I have gathered this, the product, a few drops at a time.

"The protons and the electrons," he explained, "are re-formed. They are static now, unmoving. Call this what you will—energy or matter—they are one and the same."

"Still," said Jerry, gropingly, "what has all that to do with the moon? You said you were going there."

"Yes," agreed the inventor. I am going, and this is the driving force to carry me there. I pass a certain electric current through these two liquids. I carry the wires to two heavy electrodes. Between them resolution of matter occurs. The current carries these two components to again combine them and form what we call matter, the gases hydrogen and oxygen.

"Do I need to tell you of the constant, ceaseless and tremendous explosion that follows?"

"But enough of this! You said I was crazy. I gave you a

few bad hours. I have shown you this much as a measure of recompense. You have seen what no other man has ever seen. It is enough."

He motioned Foster through the door. The roaring ceased. The inventor returned shortly, the two flasks of liquid in his hands. He transferred both to two metal containers that were ready for the precious load. He carried them with the utmost care as he went out of doors.

Once he returned, and Jerry knew by the crashes from the inner room that the laboratory work was indeed done. There would be nothing left to tell the secret to whomever might come.

He followed Winslow outside, trailing him toward a wooded knoll. There was a clearing among the trees. And in it, hidden from all sides, his eyes found another curious sight.

On the ground rested a dirigible in miniature. Still, it was small, he reasoned, only by comparison with its monster prototype: actually it was a sizable cylinder

of aluminum that shone brightly in the sun. It was bluntly rounded at the ends. There were heavy windows, open exhaust ports, a door in the side, pierced through thick walls. Winslow vanished within, while Jerry watched in pitying wonder.

Despite its size, it was a toy, an absurd and pitiful toy. Real genius and lunacy had many an over-lapping line, Jerry reflected as he approached to look inside. But he found Winslow in a room surrounded by a network of curving, latticed struts. The machine was no makeshift of a demented builder: it was a beautiful bit of construction that Jerry Foster examined.

"How did you ever get it here?" he marveled. "What you had in the cave you could pack in, but this—all these parts—castings—cases of supplies—"

The inventor did not even turn. He was busy with some final adjustments.

"Flew it in," he said shortly. "Built it in an old shop I owned out near Oakland."

"And it flew?" Jerry was still incredulous.

"Certainly it flew! On a drop or less of the liquids you saw." He pointed to a heavy casting at the center of the machine. There were braces tying it strongly to the entire structure, braces designed to receive and transmit a tremendous thrust.

"This is the generator. Blast expelled through the big exhaust at the stern. These smaller exhausts go above and below—right and left at the bow. Perfect control!"

"And you flew it here!" Jerry was still trying to grasp that incontrovertible fact. "And you were going to take me to the moon, you said."

He looked above him where a pale, silvery segment showed dimly in the sky. "But why the moon?" he questioned. "Even granting that this will fly through space...."

"It will," the other interrupted. "I tried it. Went up to better than fifty miles."

Jerry Foster took a minute to grasp that statement, then continued: "Granting that, why go to the moon? There is nothing there, no air to speak of, no water! It's all known."

The inventor turned to face the younger man in the doorway.

"There is *nothing* known," he stated. "The modern telescopes reach out a million light years into space. But the one place they have never seen—can never see—is less than two hundred and fifty thousand miles away. The moon, as of course you know, always keeps the same side toward us. The other side of the moon has never been seen.

"Listen," he said, and his deep-set eyes were afire with an intense emotion. "The moon is no tiny satellite; it is a sister planet. It is whirled on the end of a rope (we call it gravitation), swung around and around the earth. How could there be water or anything fluid on this side? It is all thrown to the other side by the centrifugal force. Who knows what life is there? No one—no one! I am going to find out."

Jerry Foster was silent. He was thinking hard. He looked about him at the clean hills, the trees, the world he knew. And he was weighing the secure life he knew against a great adventure.

He took one long breath of the clear air as one who looks his last at a familiar scene. He exhaled slowly. But he stepped firmly into the machine.

"Winslow," he said, "have you any rope handy?"

The inventor was annoyed. "Why, yes, I guess so. Why? What do you want of it?"

"I want you to tie me up again," said Jerry Foster. "I want you to carry me off as you planned. I want to go with you."

The tall man stared at the quiet, determined face before him. Slowly his own strained features smoothed into kindly lines. He grasped tight at Jerry's hand.

"I was dreading that part of it," he confessed slowly:

"going alone. It would have been lonely—out there...."

The shining cylinder of aluminum alloy was hurtling through space. No longer was it a ship of the air; it had thrown itself far beyond that thin gaseous envelope surrounding the earth; out into the black and empty depths that lay beyond. And in it were two men, each reacting in his own way to an adventure incredible. One was deep in the computation of astronomical data; the other athrill with a quivering, nerve-shaking joy that was almost breath-taking.

A metal grating that had formed the rear wall of their cabin was now the floor. Winslow had thrown the ship into a vertical climb that made of their machine a projectile shooting straight out from the earth. Gravitation held them now to the grating floor. And, stronger even than the earth-pull, was the constant acceleration of motion that made their weight doubled again and again.

The inventor moved ponderously, with leaden limbs, to take sights from the windows above, to consult his maps of the sky, check and re-check his figures. But

Jerry had eyes only for the earth they had left.

Flat on the grating he lay, his eyes over a thick glass in a proturbance of the shell that allowed him to stare and stare at what lay directly below. He watched the familiar things of earth vanish in fleecy clouds; through them there formed the great ball, where oceans and continents drew slowly into focus.

And now he was filled with a sense of great solitude. The world, in its old, familiar companionship, was gone—probably forever. The earth—*his* earth—*his* world—that place of vast distances on land and on sea, of lofty mountain ranges and heaving oceans, of cities, countries, continents—was become but a toy. A plaything from the nursery of some baby god, hanging so quiet in space he could almost reach and take it in his hands.

Beyond it the sun was blaring, a hard outlined disc in the black sky. Its rays made shining brilliance of a polar ice-cap.

Jerry Foster closed his eyes and drew back from the

glass. Again he was aware of the generator, whose endless roar reverberated in their compartment. A smaller but similar apparatus was operating on one of the liquids from the inventor's laboratory to generate oxygen and release it inside the room. An escape valve had been set to maintain one atmosphere of pressure about them. Water dripped from a condenser where both gases were formed to burn into water vapor and cool to liquid form.

One of the windows below admitted a shaft of direct sunlight; it illumined their room with a faint glow. It would never cease, Jerry knew. They were in a place of eternal sunshine, yet a realm of an endless night. Above him, as Jerry raised his head, the windows framed nothing but utter blackness, save where some brilliant point marked the presence of a star. He missed the soft diffusion of light that makes daylight on earth. Here was only the one straight beam that entered one window to make a circle of light on the opposite wall.

Jerry looked from a window of heavy glass at the side. This had been the bottom of their ship when they left.

And he found in the heavens the object of their quest. Clear-cut and golden was half the circle; the rest glowed faintly in the airless void. He tried to realize the bewildering fact—the moon, this great globe that he saw, was rushing, as were they, to their trysting-place in space.

Jerry stared until his eyes were aching. His mind refused to take hold upon the truth he knew was true. He was suddenly tired, heavy with weariness that was an aftermath of his emotional turmoil. He let his heavy body relax where some blankets had piled themselves upon the grated floor. The roar of the generator faded into far silence as he slipped into that strange spaceless realm that men call sleep.

The human mind is marvelous in its power of adjustment, its adaptability to the new and the strange. The unbelievable is so soon the commonplace. Jerry Foster was to sleep more than once in this tiny new world of Winslow's creating, this diminutive meteor, inside which they lived and moved and thought and talked. The fact of their new existence soon ceased as a topic of wonder.

They alternated in their rest. And they counted the passage of time by the hours their watches marked, then divided these hours into days out there where there were no days. Seven of them had passed when the hour came that Winslow chose for checking their speed.

They were driving directly toward the moon, which was assuming proportions like those of earth. The pilot admitted a portion of the blast to a bow port, and the globe ahead of them gradually swung off. The pilot was reversing their position in space to bring the powerful blast of their stern exhaust toward the moon, so as to resist somewhat its increasing pull.

Now their stern windows showed the approaching globe. It was slowly expanding. They were falling toward it. The inventor moved a rheostat, and from behind them the stern blast rose to a tremendous roar. The deceleration held them with unbearable weight to the rear of the cabin.

No thought now for the shining earth, yellow and brilliant in the velvet sky above. Jerry Foster watched

through the slow hours as the globe beneath them enlarged and expanded in ever-increasing slowness. Slowly their falling motion slackened as they cushioned against the terrific thrust of the exhaust below.

The globe ceased to grow and held constant. Winslow cut the exhaust to a gentler blast. They were definitely within the moon's gravitational field; their last hold upon the earth was severed. The great globe was revolving beneath them.

"How about it?" Foster asked breathlessly. "It doesn't revolve like that—not the moon!"

"We have approached from the earth side," said the other, "but we have overshot it. Say that the moon is revolving, or say that we are swinging about it in an orbit of our own—it is all the same thing."

"And soon," he added slowly, "we shall see...." He faltered and his lips trembled and refused to frame the words of a dream that was coming true. "We shall see ... the lost side of the moon. What will it be ...

what—will—it—be...?"

To Foster the whole experience had now the unreality of a dream. He could not bring himself into mental focus. His thoughts were blurred, his emotions dead.

They were approaching the moon, he told himself. It was the moon that was there below them, slowly enlarging now, as their own earth had hung below them, but dwindling, when they left.

"The moon!" he told himself over and over. "The moon—it is real!" But the numbness in his brain would not be shaken off.

His voice, when he spoke, was casual. He might have been speaking of any commonplace—a ball-game, or a good show.

"The sun is coming from my right," he said. "We are going around toward the dark side of the moon. Shall you land there?"

Winslow shook his head. "Wait," he said, "and watch."

Jerry returned to his circle of glass.

There was a shading of light on the surface below him. From the right the sun's brilliance threw black shadows and bright beams transversely over a wilderness of volcanic waste. And beyond, where the rays could not reach, was a greater desolation of darkness, its blackness relieved only by a dim light. He realized with a start of amazement that the dim light he saw was that of their own earth far above: it was lighting their approach to this sister orb.

Their side-motion was swift as they drew nearer. Another hour and more, and they were drawing toward an expanse of utter darkness. The earth-light was fading where they passed. They were approaching, in very fact, the other side of the moon.

What was below? What mysteries awaited them? He shivered, despite the warmth of the generator, cherry-red, that heated the snug cabin; shivered with unformed thoughts of unknown terrors. But he forced his voice to calm steadiness when he repeated his question to Winslow.

"Must we land there?" he asked. "In the dark?"

The inventor was piloting his ship with ceaseless concentration. Their falling speed was checked; they were close enough so that the whistling of air was heard merging with the thunder of their exhaust. He moved the rheostat under his hand, and the thunder slackened.

"No," he said. "You are forgetting your astronomy. This 'other side' is subject to the same conditions as the near side. The sun shines on them alike, but alternately. We are rounding the limb away from the sun. We find, as you see, a darkness that is absolute except for the light of the stars. Here the earth never shines, and the sun only during the lunar day. But the sun is creeping down this other side. Their day, equal to fifteen of our days, is beginning. We shall come into the light again. I am checking our motion across the surface. We shall land, when it seems best, later on. There will be light."

The thin strong hands of the pilot played over the current and valve controls. Their ship slowly swung

and dipped to a horizontal position. A blast from below held them off from the moon. A bow port was roaring as their speed slowly decreased.

Minutes merged endlessly into long hours as Jerry's eager eyes strained to detect some definite form on the surface beneath. Dimly a glow appeared far ahead; slowly the darkness faded. They were moving ahead, but their wild speed was checked. And slowly the new earth below took on outline and form as the sun's glow crept over it.

What would the light disclose? His mind held irrationally to thoughts his reason would have condemned. He found himself watching for people, for houses, lights gleaming from windows. This, in a region of cold that approached the absolute zero. The reality came as a shock.

The first rays that crept into vision were silvery fingers of light. They reflected up to the heights in glittering brilliance. They gathered and merged as the ship drove on toward the sunrise, and they showed to the watching eyes a wondrous, a marvelous world. A

world that was snowbound, weighted and blanketed with a mantle of white.

To Jerry the truth came as a crushing, a horrible blow. He turned slowly to look at his companion; to look and be startled anew by the happiness depicted on the lean face.

"I knew it," the pilot was saying. "I always knew it. But now—now...." He was speechless with joy.

"It's terrible!" said Foster. He almost resented the other's elation. "It's a hell! Just a frozen hell of desolation."

"Man—man!" was the response, "can't you see? Look! The whiteness we see is snow, a snow of carbon dioxide. The cold is beyond guessing. But the clear places—the vast fields—it's ice, man, it's ice!"

"Horrible!" Jerry shuddered.

"Beautiful," said the other. "Marvellous! Think, think what that means. It means water in the hot lunar day.

It means vapor and clouds in the sky. It means that where that is there is air—life, perhaps. God alone knows all that it means. And we, too, shall know...."

The ship settled slowly to the surface of the new world. Black blobs of shadow become distinct craters; volcanoes rose slowly to meet them, to drift aside and rise above as they sank to the floor of a valley. They came to rest upon a rocky floor.

On all sides their windows showed a waste of torn and twisted rock. Volcanic mountains towered to the heights, their sides streaked with masses of lava, frozen to stillness these countless years from its molten state. The rising sun, its movement imperceptible, cast long slanting rays between the peaks. It lighted a ghostly world, white with thick hoar-frost of solid carbon dioxide. A silent world, locked in the stillness of cold near the absolute zero. Not a breath of air stirred; no flurry of snow gave semblance of life to the scene. Their generator was stillen, and the silence, after the endless roaring of endless days, was overpowering.

But Winslow pointed exultantly from one window, where an icy expanse could be seen. "That will be water," he said; "water, when the sun has risen."

He turned on the generator for warmth. The cold was striking through the thick insulated walls. They sat silent, peering out upon that boundless desolation, upon a world's breathless nakedness, exposed for the first time in all eternity to human eyes.

Jerry's mind was searching for some means of expression, but the words would not come. There were neither words nor coherent thoughts to give vent to the emotions that surged within him.

Their watches showed the passage of nearly two earth days before they dared venture forth. They watched the white mantle of frost vanish into gas. From the darkness that they called "west," winds rushed shriekingly into the sunrise.

"Convection currents," Winslow explained; "off under the sun. In the direct rays the heat grows intense; the air rises. This is rushing in to fill the void. It will serve

our ends, too. It will churn the air into a mixture we can breathe, dispel the thick layer of CO₂ that must have formed close to the ground."

More hours, and the icy sheet was melting. A film of water rippled in the gusts of wind. Winslow opened the release valve that would permit the escape of air from their chamber, equalizing the pressures within and without. The air hissed through the valve, and he closed it so the escape was gradual.

"We must exercise," he told Jerry. "We will decompress slowly, like divers coming up from deep-sea work. But watch yourself," he warned.

"Remember you are six times as strong as you were on the earth. Don't jump through the roof."

The valve had ceased to hiss when Winslow opened it wide. The air in their cabin was thin; their lungs labored heavily at first. Jerry felt as he had felt more than once at some great elevation on earth. But they lived, and they could breathe, and they were about to do what never man had done—to set foot on this place men called the unknown side of the moon.

Earth habits were strong: Jerry brought his pistol and a hunting knife out of his pack and hung them at his belt, as the inventor opened the door and sniffed cautiously of the air.

Jerry Foster's blood was racing; the air was cold on his face as he rushed out. But it brought to his nostrils odors strange and yet strangely familiar. He was oddly light-headed, irresponsible as a child as he shouted and danced and threw himself high in the air, to laugh childishly at the pure pleasure of his light landing.

The sun made long shadows of two ludicrous figures that went leaping and racing across the rocks. Their strength was prodigious, and they were filled with an upwelling joy of living and the combined urge of an eternity of spring-times. The very air tingled with life; there was overpowering intoxication in this potent, exhilarating breath from a world new-born.

The ground that they crossed so recklessly was a vast honeycomb of caves. Between the rocks the soil was soft with the waters from melting ice, and the men

laughed as they floundered at times in the oozing mud. Beyond was a lake, and it was blue with a depth of color that was almost black, a reflection of the deep, velvet blackness of the sky overhead. And beyond that was the sloping side of an extinct volcano.

"Up—up!" Jerry shouted. "From up there we will see the whole world—the whole moon!" He laughed as he repeated the exultant phrase: "The moon—the whole moon!"

Despite their strength which carried them in wild bounds across impassable chasms, their laboring lungs checked them in the ascent. The joyous inebriation was wearing off. Winslow met his companion's eyes sheepishly as they stopped where a sheer cliff of basalt above caught and held the warmth of the sun's rays. Behind them it rose a straight hundred feet, and before stretched a vast panorama. The sun was mounting now in the sky. It brought into strong relief the welter of volcanic waste that extended in bold detail through the clear air far out to the horizon, where, misty and dim, the first

vaporous clouds were forming from the steaming earth.

And as they watched, the depressing bareness and emptiness of that gray-black expanse was changing. Far to the east a pink flush was spreading on the hills. It wavered and flowed, and it changed, as they watched, to deep areas of orange and red. The delicate pink swept in waves over valleys and hills, a vast kaleidoscopic coloration that rioted over a strange world.

In silence it spilled into the valley below. The slope they had traversed was radiant with color.

At their feet the ground was in motion: it heaved and rolled in countless places. Rounded shapes in myriads were emerging. Plants—mushroom growths—poured up from the earth to drink in the sunshine of their brief summer. They burst the earth to show unfolding leaves or blunted, rounding heads, that grew before the men's incredulous eyes.

Winslow was the first to recover from the stupefying

beauty of the spectacle.

"The machine!" he gasped. "Back to the ship! We'll be swamped, overwhelmed...." He rushed madly back down the slope.

Jerry was beside him, a revulsion of feeling driving him to frantic efforts. The piercing beauty that had enthralled him has become a thing of terror. The soft, pulpy, growing things that crushed beneath his feet were a menace in their lust for life.

They were a mile and more from the machine. Could they ever find it, Jerry wondered. The whole landscape was changed; bare rocks were half-hidden now under clinging, creeping vines. Only the sun remained as a guide. They must go toward the sun and a little north.

He followed Winslow, who was circling a huge area of weird growths that already were waist high. They leaped across a gaping chasm and fought their way over a low hill, rank with vegetation, only to be confronted by a maze of great stalks—stalks that

sprouted as they watched, dismayed, and threw out grotesque and awkward branches.

They made one futile effort to force their way, but the trunks, though pliant, were unyielding. To attempt to find their way through the labyrinth was folly.

"We've got to keep on trying," said Jerry Foster.

"We've got to get back, or...."

Winslow, as the look in his eyes showed, needed no ending to that sentence. There was the summer of a lunar day ahead; the inventor did not need to be told of the scorching, broiling heat that would wither the land when the sun struck from straight overhead. And in their ship was food and water and a means of transport to the cooler heights above.

It was Jerry who took charge of the situation. Here was a prodigious laboratory in which Winslow's science was useless, but in fighting with nature—even nature in as weird and terrifying a mood as this—Jerry felt himself not entirely incompetent.

He looked about him. It had been but an hour since they watched the first onslaught of this life that engulfed them. And now they were cut off. Through an opening, where bare rocks made a rift in the vegetation, he saw again the high ground where they had stood. There was more rock there on the volcanic slope: the growing things were in clumps—*islands*, rather than continents of rank growth.

"We must go back," he told Winslow, "and climb while we can. Get to the high ground, take bearings on the place where we left the ship. We'll look over the ground and figure some way to get there."

Winslow nodded. He was plainly bewildered, lost in the new jungle. He followed Jerry, who bounded across a crevice in the earth. The ground was rotten with the honeycomb of caves and cracks.

Jerry forced his way through and over a rock heap, where the thick trunks of nightmare trees were spaced farther apart. There was an opening ahead; he started forward, then stopped abruptly and motioned the other to silence.

From beyond there came sounds. There was rending of soft, pliant tissue. The sound came through the thin air from a grove up ahead, where big plants were waving, though the wind had long since ceased. To their ears came a snoring, blubbering snuffle. A stone was dislodged, to come bounding toward them from the hillside; the soft plants were flattened before it. The men cowered in the shelter of a giant fungus.

Beyond the rocks, above the mottled reds and yellows of the grotesque trees, a head appeared. It waved at the end of a long, leathery neck. All mouth, it seemed to the watchers, as they saw a pair of short forelegs pull the succulent tops of the giant growth into a capacious maw. Below, there was visible a part of a gigantic, grayish body. It was crashing down toward them, eating greedily as it came.

"Back," said Jerry softly. "Go back to that cave. We will hide there in some crack in the ground."

They picked their way noiselessly over the rocks. The cave they had crossed offered a refuge from the beast. It went slantingly down into the ground, a

great tunnel, deep in the rock. They dropped into the opening and started forward, only to recoil at the fetid stench that assailed their nostrils.

"A bear pit," gasped Jerry. "Great Heavens! What a smell!"

They stopped, dismayed. Far below them in the bowels of some subterranean passage was the crashing of loose stone; a scrambling and scratching of great claws came echoing to them. They leaped madly for the outer air.

"Over here," Jerry directed, and led the way, crouching, to the concealment of great stalks and vine-covered rocks. He pointed toward the open ground where they had been a few moments before. The tree-eater was out in full view. Its flabby, barrel-like body was squatted like that of some unearthly, giant toad, on massive hind legs. It sat erect, its forelegs hung in air, as a hoarse, snarling cry came from the cave. The great head, perched on the long leathery neck, waved from side to side.

The noise from the cave ceased. The rift in the earth was in plain sight from where they cowered, and the eyes of the men were upon it. One instant it was empty; the next, in uncanny silence, it was filled with huge hideousness—an enormous, crouching beast.

It was black, a dull leathery black. Its thick, hairless hide hung in creases and folds on a gaunt frame. Shorter than the tree-eater, it was still a thing of mammoth ugliness. Its hind legs were powerful and armed with claws that curved deep into the earth; its front legs displayed the same fearful weapons. A thick, heavy tail slashed forward and back over the ground. And from this to the grinning, heavy-toothed jaws and beady eyes where the long neck ended in a warty head, it was an incarnation of pitiless ferocity.

Was the scent of the hidden, shuddering men in its red nostrils? It forgot them at the sight of the beast in the clearing. The snarling cry echoed hideously in the thin air as the frightful body came erect with neck extended, jaws open and dripping. It hurled itself through the air in one terrific leap.

Had there been any lingering hope in the minds of the men that they had no carnivores to deal with, the ensuing struggle ended it. The attacker tore great masses of living flesh from the struggling, screaming body. The first cumbersome brute was helpless before its destroyer.

Jerry was trembling and sick at the sight, but he grasped his companion's arm and drew him after as he slipped quietly away.

"To the high ground," he whispered. "It's our only hope. Perhaps we can fight them off there—find some steep rock we can climb." They worked their way desperately through the rubbery, obstructing growth.

At the foot of the hill there was better going; the bare rock gave winding and twisting passage to the heights. They could have leaped over the stunted growths here, could have raced frantically for the high ground, but they dared not. To leap up into view of those fierce, searching eyes! It was unthinkable. They crouched low as they darted from their concealment to new shelter, and crawled behind rocks

when open ground must be crossed.

They had dared regain hope when again the paralyzing scream ripped through the silence. It was answered by another and another from distant points. The valley of the caves was spewing out its loathsome dwellers from their winter's sleep.

The men raced openly now for the heights. As he leaped, Jerry turned to see over one shoulder a pursuer appear. It was one of the flesh-eaters, head to the ground on their trail. At sight of them its cry rang out again. It bounded forward in pursuit. And again there were answering screams from the jungle growth.

The men threw themselves frantically up the mountainside. Once Winslow landed in a sprawling heap and groaned as he drew himself to his feet. The beast was below them. Jerry seized a great boulder, whose earth-weight would have made it immovable. He raised it above his head and sent it crashing down the slope.

Another and another he threw. One struck the great beast in mid-air; it was pure luck that drove the stone crashing against the creature's head. It fell back with a blood-chilling snarl that was half shriek. Another monster appeared, to throw itself upon the first and tear at the crushed, waving head.

Jerry took his companion by the arm. His voice came strangled from his straining lungs. "Are you hurt?" he gasped. "Can you run?"

Winslow nodded breathlessly. Again they gathered themselves for their wild, leaping retreat toward the top. An uproar of furious fighting behind them marked where a score of the monsters had gathered for the feast.

Jerry watched vainly for some refuge, some pinnacle of rock or precipice they could climb, and from which they could beat down their attackers. There was nothing but the welter of volcanic waste: rock heaps and boulders and smooth streams of solid lava. Perhaps in the crater, he thought, over the ragged crest of the cone, might be some place of safety.

The pack was in full cry again as they climbed gaspingly to the top. Beyond lay the funnel-shaped crater. Its vast inner slopes were less steep than the hill they had climbed. They were covered with a jungle, like those they had seen—a maze of red toadstools and distorted trees.

Jerry turned savagely to face the oncoming brutes. This, he knew, was the end. For this they had hurled themselves through space—to make a morning morsel for these incredible beasts.

About the men was a confusion of granite rocks, thrown from the crater to provide weapons, crude and futile, for two puny earth-dwellers. The men raised great rocks in the air and threw them with all their strength. Jerry struggled with a mammoth boulder,—Winslow leaping to his aid. They toppled it over to start an avalanche of devastation that swept into the oncoming monsters.

And again there was respite for their aching arms, while the hunger-crazed brutes tore at the bruised bodies of their fellows.

Jerry Foster looked longingly again toward the crater. Should they chance the shelter of the jungle growth? Hopeless, he knew when these monsters could crash their way through while the men were impeded at every step. The mottled, orange-green stalks, as he watched them, seemed to move. He dashed the sweat from his face—his hair hung matted on his forehead—and passed a grimy hand across his eyes. Plainly, one of those stalks crossed a rocky-floored clearing.

Was he dreaming? Was this all a dream—a mad nightmare from which he could force himself to wake? Another moved. He saw definitely a mushroom growth pass swiftly to lose itself in a neighboring clump. Dreaming? No! The screams from behind him and Winslow's hoarse yell proved the stark reality of his surroundings.

The vile creatures were close: Jerry could see their fierce heads dripping with blood. He reached for his pistol, knew instantly it was useless against these mammoth brutes, and joined Winslow, who was straining desperately at another great rock. It toppled and fell. Jerry hurled himself at a heap of smaller

boulders and sent them crashing as fast as he could seize them and throw.

One quick look behind him showed still the impossible vision he had seen. And now there were figures—a mob of them—figures that threw off their wrappings of vegetation as they ran, cast to the ground the toadstool disguises that they held. They were caricatures of men that were swarming up the hill....

He swung again in one last hopeless stand against the first horrible enemy. The two men poured a torrent of stones down the slope; they were useless, except for their delaying the advance. The beasts leaped and dodged. They were close when the rock-rain increased to a deluge.

Jerry was fighting in a red haze through which he saw dimly. He was aware of the hailstorm of boulders that were thick in the air. He saw vaguely the white faces and copper-clad bodies of strange men leaping about him, and he heard the wild bedlam of their shrieks as they joined in the mad battle against the common enemy.

The beasts were swept off in a landslide of loose rock—all but one. Above them, on a high point of stone, it was crouching to spring. A wild human figure, its flesh white as chalk, leaped forward with a tangle of fibers. The tangle was thrown as the brute was in air. A net spread and wrapped around the monster. It fell, clawing and tearing, to roll helplessly down the slope.

The battle was won. Jerry swayed drunkenly on his feet. About him the mountains seemed whirling, where unreal figures of men with dead white skin and shining copper armor danced dizzily.

He met for an instant the look from Winslow's dazed eyes. Out of the past a picture flashed clearly: Winslow—this same Winslow—arguing that the moon might hold mysteries still. He laughed thickly.

"And I said it was all known," he muttered through slack lips. "Nothing on the moon that wasn't known...."

He was still laughing in a wild inebriation as a net settled close to entangle his swaying figure and bear

him helpless to the ground. He saw Winslow similarly bound, saw him lifted to the shoulders of shouting, yelling men, whose stupid, pasty faces were wide-eyed with excitement.

He, too, was raised into the air.... They were being carried toward the crater's mouth....

A fight for life in thin air does not make for clear thinking. Jerry Foster knew only that a nightmare world was whirling about him; that beneath him powerful shoulders supported, while the one who carried him leaped at racing speed down the slope.

They went more slowly down pathways cleared through the rank vegetation. Soft, pulpy vines from the grotesque trees brushed his face. He tried vaguely to shield himself, but his hands were bound fast. He was helpless in the entangling folds of the net.

The touch of cold stone brought him to his senses. He was lying on smooth rock. They were in a clearing. He turned his head to find Winslow, but could not find

him.

Across the open ground were naked men, their bodies, like these others, dead white in the sun's glare. They were dragging giant stalks to earth by means of ropes. Trunks and branches, bright in their colors of yellow and orange and flaming red, were hacked to short lengths and piled on all sides. The workers, as Jerry watched, dropped their implements to race toward him. There was a press of flat, white faces above. His captors, in their copper armor, beat the newcomers back. The babel of chattering voices was deafening.

Again he was lifted into the air—plainly these were no weaklings he had to deal with—and again the warrior band surrounded him as the march was resumed. The milling, shrieking crowd of workers followed in an ear-splitting mob.

The forest ended, and the men went slowly now down smooth, rocky slopes to stop upon a wide, level expanse. Before he was placed on the ground Jerry had a glimpse of a funnel-shaped pit—the mouth of

the extinct volcano. And toward it, bound and helpless, was being carried a struggling form which he thought he recognized.

"Winslow!" he shouted. But the bodies in their gleaming copper armor closed about him in a solid throng and cut off his view.

In the sky the sun had moved slowly upward since first they landed. It slanted brightly now into the eyes of the prostrate man and made a spectacle of his twisting contortions as he tried to get his hands on his knife in its sheath at his belt. This and his pistol were under his coat. But he could not reach them. He lay panting with his exertions.

One of the warriors seemed to have authority, for his arms alone of all the group were sheathed with copper circlets, and the others obeyed his orders. Jerry addressed himself to this one. He knew the words were unintelligible, but he pleaded desperately for a chance.

"Take this off," he said. "We are friendly—friends—"

friends!" He struggled to keep himself from shouting, to keep his voice under control. "The other man," he said, "bring him back." And again he repeated: "We are friends."

He scanned his captors' faces.

The pasty face above him was impassive; the eyes stared uncomprehendingly into his. Then the figure barked an order. One of the warriors swung Jerry lightly to his shoulder, and started toward the pit.

At its edge was a basket, a huge affair of knotted fiber ropes. Dimly, Jerry saw other baskets standing about: they were filled with the fragments of fungus. Still bound, he was placed in the empty container. Hands grasped the meshes, and he was swung out over the edge. A rope was above him: he was lowered steadily into the dark shaft.

Jerry breathed a sigh of relief. This was not death—not yet. And Winslow? Safe, perhaps, for he had traveled this same road.

There was figures outlined above against the circle of light, figures that clambered like apes down swaying ropes. The light glinted and sparkled from their shining armor. His escort was still with him.

The circle of light changed to a glowing ring, where only the rim was lighted. Above was the deep black of the lunar sky. Then the circle faded to a mere point as he went down into the pit.

The rope basket came to rest upon a rock floor, and Jerry was lifted out. He saw plainly the figures about him, and he wondered vaguely at the light that came from the walls of the cavern. There were long lines of soft light, leading off into the dark, lines that marked plainly a labyrinth of passageways, leading in all directions.

Beyond a narrow entrance was one brighter than the rest, a broad avenue that led downward still further into the depths. Here he was carried. He tried vainly to keep some mental map of their course. He would return some day—he *must* return—he and Winslow. They would escape.... But the passage turned and

twisted; there were many branching corridors, each with its lines of light. Jerry gave up the attempt. It was a maze of serpentine streets beyond his power to remember and recall.

Before him the passage was still wider. It was opening into a great room.... Jerry found himself upon the floor. He strained cruelly at the cords about his head as he twisted and turned to get a view of his surroundings.

The room was a cave, its vast vaulted ceiling sprung high above a level floor, where the figures of men—odd, plaster-white figures like animated statues—were small in the distance. His eyes were drawn quickly to the brilliant glow of the farther wall. There was the bright black of basaltic formation, and in it—though he knew the impossibility—was shining the sun.

Jerry blinked his eyes to look again and again; the golden circle was dazzling. It was set at a point well above the smooth floor, and up to it there led a sloping pathway of gold. It was as if they had indeed

captured their god, these worshipers of the sun, had captured and held it for the adoration of the grovelling people.

Jerry saw them upon the floor. The copper of the armored men gleamed bright in the glow from beyond, as they abased themselves and crept slowly toward the light. At each side of the dazzling orb was a platform. There were figures upon it, seated figures, Jerry saw, even at a distance, that were robed in vestments of the sun. Their forms gleamed gold in the light.

The leader that Jerry had noted among his captors crept on in advance of his men. From among the bright figures on the platform above one rose to extend a glowing arm. He spoke, and the tones rolled majestically back from the high vault above. The crawling man below him stopped rigidly where he was. Another word from above, and he rose slowly to his feet. He stood full in the glow of the captive sun, to be outlined in black against the brilliance beyond.

Haltingly he spoke. Then, seeming to gain confidence,

he launched into a torrent of words. He gestured and waved, and, to Foster, the sign language was plain. He saw reenacted the surprise of the warriors upon beholding these intruders; saw how they had spied out upon them, using trunks and branches of the fungus as a screen; saw in pantomime their own battle with the beasts, then the rush of the armed men to the rescue. Again the net was thrown, and the gesturing figure turned to point dramatically where Jerry lay bound, then pounded his armored chest with unconcealed pride.

He ceased to speak, and there was utter silence in the room as the figure above crossed to stand before the golden sun. He too abased himself before the sign of their god, then rose, to stand motionless, listening....

For a breathless interval he waited before the oracle, then prostrated himself again and returned to his place.

He repeated, it seemed, a command, congratulation, to judge by the ecstasy of the figure below. The warrior turned once to throw himself before the

image of the sun; he repeated this again and yet again before he crept back to his fellows. The group arose and rushed swiftly toward the bound man.

They brought him quickly into the presence. With scant ceremony Jerry was unrolled from the net; he lay free and gasping upon the floor. The men scurried like mad from out the pathway of light that shone down from the false sun. Jerry rose to his feet; the brilliance before him almost blinded, but he saw now whence it came.

There was a hollow in the wall, a great parabola, deep and wide, and it was lined throughout with beaten gold. In a straight path the light was reflected from every point—every point but one for at the far end, where the curved sides joined, was a circle of darkness. It stared like an eye, evil, portentous. Jerry nerved himself for an ordeal, unknown but imminent. The black eye glared at him unwinkingly.

Before him was the pathway of light: it shone brilliantly down the sloping ramp where a floor of bright gold led up to the sun god itself.

The figure on the dais raised its hand. Jerry heard the words come from its lips and roll sonorously back from above. The figure waited for an answer.

Jerry's hands slipped beneath his coat to rest reassuringly upon his weapons. He withdrew his hands empty and raised one toward the figure above.

"I do not understand your words," he said. "Your language is strange. No doubt mine is as strange to you. I come as a visitor—I am friendly." He held out both his hands, palms upward.

"We have come, my friend and myself, on a friendly errand." He paused to look vainly about for Winslow. "And you have received us as if we were wild animals."

Jerry Foster, of San Francisco, U. S. A., was suddenly resentful of their treatment. His words were meaningless, but his tones were not. "You have tied us," he said, "bound us—dragged us before you. Is that the way you receive your guests from another world?"

The golden-clad figure stood in majestic silence while Jerry was speaking. It waited a moment after his outburst, then crossed again to bow low in the floodlight of gold. As before, it seemed listening to words from the black heart of the strange sun, words quite inaudible—soundless. He returned quickly and waved Jerry's attention to the place of light.

The sense of a presence there in the central blackness was strong upon the waiting man. In that other life that now seemed so remote—his life on earth—Jerry had once felt the threat of a concealed intruder in the dark. He recalled it vividly now. The sensation was the same.

But it was magnified. There was no denying the reality of a malign something at the heart of that golden glow. The black center of it vibrated with cold and venomous hate. It struck upon the waiting man like a physical force. His head was swimming, his thoughts refused to form. He was as if suspended in a great void, where all that was lay deep in the center of that radiant orb. And it drew him irresistibly on.

Like a dazed bird, held and stricken in the hypnotic gaze of a snake, Jerry took one stiff, unconscious forward step. Another, and another. He strove dumbly, helplessly, for realization—there was nothing in the universe but the certain thing ahead.

His foot was upon the golden incline leading to his doom, when that buried something which marks a man—the spark of divinity which sets him apart as one alone—reasserted itself.

"I am," he heard his own voice shouting in strangled tones, "I am Jerry Foster! I am I ... I am myself!"

He awoke from his stupor with a shock that set every nerve-fiber quivering. For long minutes he stood silent. Then, realizing his victory and proving it to his own soul, he looked straight into the black center of the threatening sun god, and he laughed, loudly and contemptuously.

[Image description start: A two-page, black and white illustration showing a crowd of people looking at a big ball of light with a black hole in the center, with one man standing in front, his hands on his hips, with other, ornately dressed people crowded around the edges of the drawing, holding sharp weapons. Image description end.]

Then, turning, and with steady stride, he walked calmly from the light.

The great hall was silent with a silence that was breathless. Then pandemonium broke loose. The

priests and the god had been defied, and screaming and shouts rang throughout the vast chamber to re-echo batteringly from ceiling and walls. There was tumult and confusion where the populace thronged. Even the figures above on the dais were milling about in disorder; the rippling gold of their robes made a spectacle that forced Jerry's involuntary admiration.

Then one from among them sprang forward. His voice roared above the shattering din. The room was still. Another order, and the guard of armed fighting men formed in a circle about the defier of their god.

Jerry waited. Trouble was about due, he told himself. One hand was on his pistol, tense and ready. As the ranks stood silent and made no move to attack, Jerry Foster did a curious thing.

It was not done intentionally, but Jerry Foster had nerves, and they had been under a strain. His hand went unconsciously to his pocket and extracted a cigarette. There were matches there, too, and he struck one and lighted the white cylinder. The match made a tiny flame where he flipped it.

The whole room whispered and hissed with one loud gasp of amazement, but the moan that followed, that echoed and resounded from the roof, was of nothing but horror. Even the warriors drew back in trembling dismay. And before them the stranger they had brought to the very portal of their sanctum of holies blew clouds of white smoke that eddied and whirled as they rose round his head.

The effect was not lost upon Jerry. And his mind was working. Was fire unknown to these strange beings? Here in the deep caverns, far from the surface, was fire a thing of terror to them? He looked back toward the wall.

"If they rush me," he thought, "there's a good place to be. That will feel mighty comfortable at my back."

He walked slowly, the smoke rising thick about his head. The copper-clad figures before him withdrew, the ranks parting to let him through. Unharméd he reached the safety of the wall. The enemy now formed a semi-circle before him.

The inertia of the stricken beings on the platform was broken by his move. Again their head priest gave an order; from another side a second detachment of armed men came on. They were carrying something. Jerry leaned forward in quivering preparedness as he saw, in the floodlight of radiance, the body of Winslow lying on the floor.

Was he injured? Dead? The devastating loneliness that swept him at the sight of the still body was unnerving. He breathed a long sigh of relief as the lanky figure rose slowly to its feet. Winslow was alive! They would show these beastly, unearthly humans something yet.

There was no preparation—no preliminaries. Whether Winslow could have reacted as Jerry had would never be known. He seemed stunned and helpless, and it was with no resisting hesitation that he began the climb to the unknown.

Jerry's crouching tenseness snapped. No thought of the gun as he sprang toward the enemy between him and his friend. "No, Winslow—no!" he shouted as he

leaped at the figures in front of him.

Their strength had seemed startling to Jerry when they had carried him like a child. He had forgotten his lightness here on this unheavy world. And he had forgotten his own great strength.

No panting, exhausted, beaten fighter of beasts was this that hurled himself against the ranks before him. One coppery sword flashed upward above his head. Its bearer was seized in two hands that picked him bodily from the floor and crashed him, a living projectile, among the others. Jerry waited for no more. There was an opening ahead, and beyond was Winslow, walking stiffly, certainly, up that damnable slope. He threw himself in giant leaps across the floor.

His companion was half-way up the glittering ramp when Jerry seized him. Holding him in his arms, he leaped outward, to land rolling on the floor. He was on his feet in an instant. He dragged Winslow to a standing posture.

"Wake up, man," he was shouting. "Winslow—wake

up!"

The onrushing horde was upon them while the tall man was still brushing his hand over weary eyes, and Jerry, for the moment, had the fighting to himself.

No time for anything but parry and strike. He caught one white face on the jaw; the man went bodily through the air. Jerry landed again and again. His weapons were his fists, and they did fearful execution. And he knew, at length, that he was not alone.

The long arms of the inventor tore a sword from an upraised hand. Its owner was thrown, as Jerry had thrown one previously, to catapult among its fellows.

They were clear for an instant. "Back to the wall!" shouted Jerry. He had time and room to reach for his pistol, and drew it quickly from its holster. They backed hastily to the protection of the stone wall. There were scores upon scores of copper-clad figures that followed them held out of reach. With a flashing of gold, the head priest himself sprang to urge on his men.

"Ready!" said Jerry. "I wish you had a gun! Here! Take this!" He handed his companion a long-bladed knife, then turned to aim his pistol with steady hand at the oncoming figure in golden robes.

The priest stopped for a brief scrutiny of this new menace, then screamed out an order and hurled himself into the sheltering press of men.

Jerry fired into the whirl of bodies. The roar of the forty-five tore like a battery of siege guns throughout the great room. But the creatures before them were fighting now in an insane frenzy. Their bodies pressed the two men to the wall. Jerry fired again, and the fall of a limp, gold-robed body gave him a thrill of delight.

The inventor was holding a white body as a shield, while he thrust past it incessantly with a red blade. There were huddled figures before them that lay quiet or crept painfully away. The body of the head priest was being carried off.

The dark mouth of a passage had impressed itself upon Jerry; he remembered it now. It offered a means

of escape.

"Off to your right," he said. "Work off to your right. There's a hole in the wall—"

They fought off the struggling eruption of bodies that drove at them. Jerry was saving his ammunition, but once more he fired as a sword was falling over Winslow's head. He drove strongly with his left and beat at the white skulls with the butt of the gun gripped in his other hand.

The passage was suddenly behind them. One last stand against the screaming, frothing faces, and they backed, panting, into the sheltering dark. Jerry stopped and took Winslow by the arm.

"Are you hurt?" he demanded. The inventor was too breathless for reply.

"Nothing much," he panted, after a moment. "One got me along the cheek—you shot him just in time. How about you?"

"O.K.," was the assurance. "But, man, I've been hammered!"

"What a peach of a fight," he added. "But now what?"

Winslow laughed mirthlessly in the dark. "This looks like a one-way street," he said. "We can't go back.

"Say," he demanded, with sudden, dim recollection. "I remember something of a dream—a ghastly sort of thing. I was ... I was ... where was I when you collared me? Where was I headed?"

"For something too damnable for us to imagine," Jerry stated emphatically.

They were walking as rapidly as they dared through the dark passage. There were high-pitched voices from the rear. From somewhere ahead came the sound of running water.

"Too damnable to imagine!" he repeated. "But we'll hunt the vile thing out if we get a chance, and we'll slaughter—"

The words ended in a startled exclamation as the ground fell beneath their feet. They pitched headlong into nothingness—

There was water in Jerry's face as he fell. A torrent engulfed him as he struck into it, pouring in from a lower passageway to plunge straight down the shaft. The roaring crash of water tore madly at his body; his arm was shot through with stabbing pain as Winslow's falling body was torn from his grasp.

He was conscious only of his bursting lungs when he came to the surface from the depths into which he plunged. With one arm he swam weakly, the other trailing at his side, while he gulped greedily at the air.

A voice came hoarsely from a distance. "Foster," it called. "Jerry—where are you, Jerry?"

Ah, the good air in his lungs—he could swim more strongly now. He managed to gasp an answer: "Here, Winslow, over here!" There was a splashing in response to his voice. He heard it over the noise of the waters he had been swept away from the cataract.

A hand was upon him in the dark. "Hurt?" asked the welcome voice. "Can you swim, Jerry?"

"A little. One arm's working."

The hands fumbled over him quickly, and his good arm was drawn over the other's back. "Hang on," Winslow told him. "I can swim. I'm half fish."

Jerry clung to the folds of the coat. He was light in the water, he felt—riding high—and the man beside him was swimming with strong strokes. He released his hold on the other as he felt strength ebbing back into his body.

"I can paddle," he said: "but stick around. Where are we going?"

"In a circle, probably," was the reply, "though I'm trying to hold a straight course. How big is this lake, I wonder?"

They swam slowly, saving their strength, but it was a time that seemed like endless hours before the

answer to Winslow's question was found. Jerry was fighting weakly, exhausted, and the hand supporting him was failing when they felt sharp rocks against their dragging feet. The hand that had held him still clung tightly to his shoulder as they struggled upward and fell together where great rocks gave safety in the darkness. In his arm the sharp pain had dwindled to numbness; Jerry Foster asked only for sleep.

There was light about him when he awoke. In his stupor he had found again the surroundings he knew so well—the clash and clatter of a distant city—the roaring traffic—signals, and glowing lights. He came slowly back to unwelcome reality. The light was there, but it shone in luminous lines along the wall to illumine the hateful familiarity of the honeycombed rock that composed the moon.

It showed, too, a familiar figure, breathing heavily where it lay on the far side of the small room.

Winslow's face was pale in the dull light, and his eyes were closed. He was on a thick pallet of soft fibers and across his body a cloth was spread, shot through with gold in strange designs.

Jerry Foster threw aside a robe of the same material that covered him. He stifled an involuntary word as a twinge of pain shot through his arm, then crossed noiselessly to shake softly at the shoulder of the sleeping man. Winslow, too, came slowly from his sleep of complete exhaustion, but his eyes were clear when they opened.

"Where are—" he began a question, but Jerry's hand was pressed quickly against his lips.

They stared slowly about. The room that held them was in the natural rock, but whether hewn out by hands or a natural formation they could not tell. The rock was rotten with perforations, through which air flowed in a cool stream.

Jerry came softly to his feet to feel cautiously of the glowing, luminous mounds along the wall. They were spread upon a ledge. The light was cold to his touch, the material like fine soil in his hands.

"Fluorescent," whispered Winslow. "Calcium sulphide, possibly; I saw them spreading it above ground in the

sun. It absorbs light and gives it off slowly." Jerry nodded; the source of the endless glowing lines had been puzzling to him.

Their whispers ceased at a sound beyond a doorway. In the opening a figure appeared, tall and erect, the figure of a girl. Her face was white like the others of these whose lives were lived below the surface, but there was a kindly softness in the eyes, a refinement and intelligence of no low order, that contrasted with the cold eyes of the warriors and the priests. Not beautiful, perhaps, by earth standards, yet it required no straining of chivalry on Jerry's part to find her human and lovely.

In silence the men stood staring. Then Foster, with unconscious gentleness, made a revealing gesture. This woman—this girl—had saved them. He knew it without words, and he was wordless to reply. He dropped swiftly to his knees and pressed a bit of the golden robe against his lips.

A flush of scarlet swept across the white face and receded. The hand dropped from its startled poise

and rested, gently, questioningly, on the brown head bent before her.

She murmured unintelligible words in a guarded voice as Jerry arose. "Marahna," she said, and touched her breast lightly. "Marahna." Her head was erect, the whole attitude imperious, commanding. She questioned them with swift, liquid words. The men shook their heads in utter incomprehension.

Again she spoke, and again they shook their heads. Jerry felt foolish and dumb. He took his turn at questioning, and this time, with a trace of a smile, it was the girl's turn to shake her head. She had mastered one sign at least.

Pointing toward the great hall they knew was somewhere above, she reenacted the scene there; she evidently knew what had transpired. And now Jerry nodded in confirmation. That she approved of the part they had played was evident.

Now she questioned whence they had come. She pointed down, and her fluttering hands and graceful

posture spoke eloquently. She showed them more than a trace of fear, too, as she marked them coming from the depths. Jerry shook his head in vehement denial.

He pointed above, spread his hands wide, tried as best he could to indicate vast distance beyond. She stared, wide-eyed, then in her turn knelt as if before a god.

"She thinks we have come down from the sun," Winslow surmised. "Well, let it go at that." But Jerry Foster was embarrassed in the strange role of a god; he raised the humbled, kneeling young woman to her feet.

He pointed to her gold-clad figure and repeated the name she had given. "Marahna," he said. "Marahna!" Then, placing his hand on his companion, he repeated: "Winslow—Winslow!" And, pointing to himself, he completed the introduction with: "Foster, Jerry—Jerry Foster!"

The pale lips formed themselves slowly to the strange

and unaccustomed sounds.

"Cherrie," she repeated, and smiled in comprehension. "Cherrie."

This was the first of many lessons, and it was amazing to both men how rapidly they learned to get their thoughts across. In turn, they learned to read the messages that the slim hands and graceful, undulating body conveyed. Even words were linked one by one with their indicated objects and meanings.

One syllable the girl used only in a hushed and awe-stricken tone. It was "Oong" that she whispered, while her eyes filled with terror and dread. And they knew this for the name of the horror that waited in the black center of that unholy place where the pathway of light ascended. It was later that they learned to read hatred as well as sheer terror in the emotions that the word *Oong* aroused.

The first lesson ended in a soft exclamation from the girl. She withdrew, to return in a moment with a beaker of hammered gold, filled with cold water. In

her hands, too, were strange fruits and branches of fungus. She ate bits of them to show they were food. And Jerry, as he watched her, was aware that he was famished. But the two men ate sparingly at first of the strange food.

It was tasteless, they found, except for an elusive flavor, but the reception of the food in their gnawing stomachs was satisfactory. Their strength was returning, and with it came hope of release. The moon-people, evidently, were not altogether villainous.

"Thank you," said Jerry in a normal tone, "that was—" White fingers trembled against his lips to enforce silence.

The girl listened intently, then stole softly out into the corridor from which she had come. She motioned the men to follow, and pointed there in the dim light to a far room.

There were others, they saw; a group of young women lying at ease on their pallets, or moving slowly

about. The need for quiet was apparent, more so when the figure of a man appeared as they watched. Quickly the girl, Marahna, stepped before them and motioned them back to their room.

She followed and glanced quickly about. In the farther wall was an opening, close to the floor, and low, but they managed to work their way through at her silent command. A passage, much like the others, lay beyond. It widened and grew higher, until they could stand erect. Back in the circle of light they saw, for a moment, the man, bowing low in respect before Marahna. He carried a basket of light that shone brightly in the room.

"Replenishing the supply of sulphide," whispered Winslow.

A current of air came cool and refreshing from a branching tunnel in the rock. There was no lack of ventilation, as they well knew, throughout all the tortuous passages, but this came with a scent of outdoors that set both men a-tingle with hope. Jerry forgot even the dull ache in his arm as he breathed

deep of this messenger from the outside.

But exploration must wait. They needed to rest, to learn and to plan. They returned when Marahna called softly from the room.

Time had lost all its meaning. They could only guess at the hours that had passed since the hour they left their ship, could only make unanswered surmises as to where was the sun or how much was left of the long lunar day. They must escape—they would escape—but their one stroke for freedom must not be made when darkness and paralyzing cold should force them back into the hands of the enemy tribes.

Marahna was with them much of the time, and always they struggled and strove with desperate concentration to grasp at the meanings of the thoughts she tried to convey. And they learned much.

Of the passage they believed they had found out to the surface, she knew little. But she showed them, with doubt in her face, that there was almost hopeless struggle along that path to the freedom above. Sadly

she touched Jerry's injured arm, and she shook her head in dejection.

The arm had had a bad wrench, Jerry found. No fracture, but the muscles and ligaments had been painfully torn. But Jerry set his teeth firm at the thought of a possible escape.

Once, peering along the dark passage that led to the room where the others had been seen, the men noticed the deep bows that unfailingly marked the entrance of Marahna. They questioned her and learned that here was royalty among the people of the moon. This, as they considered the proud poise of her head and her whole attitude of unassuming superiority was not entirely surprising. But they marveled the more at the truth that she finally made plain to them.

Marahna, she told them, as plainly as if she were speaking in their own tongue, Marahna was chosen for death. And her white face was pitiful and her eyes full of horror as she enacted for them the slow march she must take up the long golden slope and into the

horror that waited.

"A sacrifice to that god!" Jerry spoke with dismay.

"No, no!" But the face of the Princess Marahna of the moon people was unutterably sad with unspoken thoughts as she touched her breast with one slender finger, then indicated the outer room and showed there were two there beside herself who were to go.

"Help us to get out," Jerry begged, and with fierce eagerness he showed them going through the passage to the outside. "We will come back, and we will find some way to end all this damnable thing."

She gave them to understand the time that was left. The sun, she showed, was long past the meridian and was on its return. The day was now reaching a close. And then, as the sun set, the great sacrifice would be made—had always been made—to insure the return of their god.

Their watches were useless, for the water had entered their cases. The two men waited what they judged was the length of a day, while Jerry tried to

believe that his arm was improving. Then, putting a small supply of food in their pockets, they were ready for the attempt.

Jerry saw that his gun and knife were ready at his belt, and patted a pocket where his matches were safe in their watertight container. The prospect of escape almost unnerved him. To breathe the clear air; to stand in the radiant light of the sun—he could understand now how these people made a god of the sun. He turned to Marahna.

"Good-by," he said, "but not for long. We'll be back. And we'll save you, Marahna, we'll save you. Winslow will figure some way to do it.... We'll be back...."

The girl was silent. She touched Jerry's arm, and shook her head slowly, doubtfully.

He reached for the hand. It trembled, he felt, in his. The impulse to take the slim form within his arms, to hold her close, was strong upon him. Would he ever see her again ... would he?

"Won't you say good-by, Marahna?" he asked.

But she smiled, instead—a friendly smile, and encouraging. Then dropped in silence to her knees to press with both her trembling hands his hand upon her forehead. And, still in silence, she rose to vanish from the room.

The men entered the narrow opening to start forward into the dark. But Jerry Foster was puzzled, puzzled and more than a trifle hurt. Marahna could at least have said good-by. She knew the word, for he had taught it to her. And she had let him—them—go....

"Oh, well," he thought, "how can I know how a princess feels—a princess of the moon? And why should I care—why should she? But...." He refused to complete the thought. He hurried instead, as best he could, to follow Winslow, fumbling ahead of him in the dark.

Jerry had used plenty of muttered invective with the massage he had given his arm, but he cursed his handicap wholeheartedly at the end of some several

hours.

They were standing, he and Winslow, in a dark tunnel. They had climbed and clawed their way through the absolute dark, over broken fragments, through narrow apertures, down and up, and up again through a tortuous, winding course. And now they had reached the end. They had found the source of the fresh air, had come within reaching distance, it seemed, of sunlight and all that their freedom might mean. And they had come, too, to a precipitous rock wall.

They stared long and hopelessly at the shaft that reached, vertical and sheer, high, high over their heads. And a curse like that of Tantalus was theirs. For, far at the top, slanting in through some off-shooting passage, there was sunlight. It was unmistakable in its clear glare, beautiful, glorious—and unattainable.

There were roughnesses in the wall, footholds, handholds here and there. "It might be ... it might be...." Jerry tried to believe, but the ache in his arm

made the thought hopeless and incomplete. He turned to his companion.

"I believe you can do it," he said steadily.

Winslow's dark eyes were gleaming in the dimness that surrounded. "Possibly," he replied, and eyed the ascent with an appraising stare. "Even probably. But you know damn well, Foster, that I'm not going to try."

"Don't be an ass." Jerry's tone was harsh, but the tall man must have known what emotions lay underneath.

"We'll play it out together," he said.

Jerry was silent as he reached in the darkness for Winslow's hand.

"Of course I knew you were that sort," he said. He waited a moment, then added: "But you're going, old man, you're going. Don't you see it's our only hope?"

Winslow shook his head emphatically. Jerry could see him in the dim reflection from that radiance above.

"Nothing doing," the calm voice assured him. "Don't bother to think up more reasons why I should desert."

"Listen!" Jerry gripped roughly at the other's shoulder. "Listen to reason."

"If you go and I go back there, what will happen? With Marahna gone we are helpless, and we will be helpless to save her. The long night is ahead. How can we live? Where can we live? We will be wiped out as sure as we're alive this minute."

"If you go—and if you make it to the ship—there's a chance. Alone, I may manage to stick it out." He knew he was lying, knew that the other knew it too, but he went on determinedly. "You can wait for me up above. My arm will be well—" Winslow stopped him with a gesture.

"There's a chance," the older man was muttering, "there's a chance...." He swung quickly toward Foster, to grab hard at the good right hand.

"I'm going," he stated. "I'm on my way. I won't say

good-by; what's the use—I'll be back soon!"

He released his hold on Jerry to leap high in the air for a ledge of projecting rock. He caught it and hung. His foot found a toehold and he drew himself up to where another rough outcrop gave grip for his hand.

Jerry Foster stood frozen to throbbing stillness. Words were strangling in his throat, an impulse, almost irresistible, to call. If there were only a rope....

He was still silent when the tiny figure of his companion and friend was lost in the heights, where it vanished into that tunnel from which came the light. He turned blindly, to stumble back into the dark.

Marahna was waiting when he regained the safety of her room. "Safety!" The thought was bitter when linked with the certain fate that lay ahead.

Silently she stroked the bent head of the man who dropped dejectedly upon the hard stone floor. Her fingers were gentle, comforting, despite the utter

hopelessness and discouragement that lay heavily upon him.

They sat thus, nor counted the flying minutes, while the fog of despair in the mind of the beaten man was clearing. He raised his head finally to meet the look in the dark eyes. And he managed a smile, as one can who has thought his way through to the bitter end and has faced it. He patted the hand that had stroked his bowed head.

"It's all right," he said gently. "What is to be, will be—and we can't change it. And it's all right somehow."

His sleeping, during their long stay, had been a cause for amusement to Marahna, whose habits were tuned to the long days and nights on the moon. And he was sleepy now, sleepy and tired. She spread the robe over him as he rested on the soft fiber bed.

He awoke from a deep sleep with a light heart. For Jerry Foster, as he faced his own certain death, had seen certain things. It was the end—that was one fact he couldn't evade. But he grinned cheerfully, all by

himself in that strange cheerless room, as he thought of what else he had visioned.

"And it will be just one hell of a fight," he said softly aloud. "There will be some of those priests that will know they have been in a war."

He examined again the knife and the automatic, and counted the cartridges left in the magazine. There were more he had found in a pocket of his coat, enough to replace those he had fired. He slipped the pistol into its holster at the sound of soft footsteps approaching.

It was Marahna who entered, a strange and barbaric Marahna. She was clad in a garment of spun gold that enveloped her tall figure. It trailed in rippling beauty on the floor—draped in resplendence her slim body, to end in soft folds about a head-dress that left Jerry breathless.

Her face was entirely concealed. The gold helmet covered her head. It was tall, made entirely of hammered gold in which spirals of jewels reflected

their colors of glittering light. She was quite unrecognizable in the weird magnificence.

Only her voice identified the figure. She murmured chokingly some soft words, then raised her head with its barbaric helmet proudly high as she concluded. There were words become familiar now to Jerry. Together with the spectacle she presented, her meaning was more than plain.

"The time has come," she was telling him. "The sun ... the hour of sacrifice."

Jerry leaped to his feet. His plans for battle were being revised. An idea—a plan, half-formed—was beating in his brain.

A sound was beating upon him, too. There were drums that throbbed in steady unison, that echoed hollowly along resounding walls, that approached in loudly increasing cadence.

The plan was complete. "No!" said Jerry Foster, with a wild laugh. He reached to remove the golden helmet.

He placed it upon his own head, under the startled gaze of the wondering girl. He reached out for the robe.

"You shall not go," he told her. "I will go in your place. And when I reach that room...." His eyes were savage behind the slits in the golden head-dress.

"No—no!" the girl protested. Her face showed plainly the complete hopelessness of what Jerry proposed. To pit himself against that antagonist—she knew how futile was the brave gesture.

Jerry was undaunted. "I've got to die anyway," he tried to explain, "and if I can get in one good crack at whatever is there—well, I may be of help."

His hand was taking off the cloak. Marahna's eyes were steady upon him. She ceased to resist. She whipped one of the covers from the couch about her and helped him with the golden robe.

The throbbing of drums was hammering at Jerry's temples. They were close at hand! Marahna, without

a word, rushed frantically back toward the room where the others waited.

And again Jerry Foster felt that odd tightening of disappointment about his heart. But what was the difference, he told himself, in a hundred years—or a hundred minutes. He set his lips tight and walked slowly out and down the passage.

The room he entered was deathly quiet. There were figures standing about, figures robed in their gold-threaded drapes, that stared strangely, wonderingly, at him, and drew themselves into a huddled group against the wall. And two there were, who stood apart: the other victims—their sacrificial garments wrapped them round where they waited for the third who was to accompany them. Jerry joined them as a guard came in from the outer hall.

The drums were rolling softly in their rhythmic beat. The priests who entered showed annoyance at the delay; they gave a curt order, and motioned the three to follow.

Outside, the corridor was broad, and the double rows of lights on either side glowed brightly to illumine a pageant grotesque and terrible in its barbaric splendor. The drums throbbed louder. Jerry saw them in their fire of burnished metal, beaten by the bands of naked men. Beyond, a group of warriors waited. Stalwart and strongly muscled, they stood erect in copper armor beside a platform of metal bars, whose floor was of latticed gold. The victims were placed upon it to stand erect. Jerry balanced himself upon the golden floor as the warriors raised it slowly to their shoulders.

Priests, in robes of heavy golden rope, were ranged about; they formed a guard and escort ten deep about the living sacrifice. At that the drums increased their volume, and to this was added a nerve-racking, discordant and rasping jangle, when sheets of copper, paper-thin, were struck with a heavy hand. The pulsing, throbbing pandemonium was terrific as the march began.

Slowly they made their way through a winding gallery. Slowly they came to where a portal, high-

arched, gave entrance upon the great hall. Solemnly, proudly, the priests lead the way as they circled the vast room. Their wrappings of gold were a scintillant quiver of light; above each hard face a circle of gold—symbol of the sun—was borne imperiously high.

The priestly guard surrounded the platform where the three standing figures were huddled. And behind, and on either side, the men with the drums and the discordant, ringing sheets gave full force to their blows. The high vault above thundered and roared to the thunder and roar of the drums. And, high over all, a wailing began.

The thin shrillness beat with the tempo of the drums in a pitch that steadily descended. The glittering procession had come to rest at its appointed place in the pathway, of light as the wailing came down to a moan. "*Oong! Oong!*" the voices groaned, while the walls re-echoed the despairing tones. Only from the band of warriors did the ear of Jerry Foster detect anything but misery and despair. The priests were silent, but the warriors, in their shining armor, stood erect and roared out the syllables in exultant joy.

The priests were now upon the dais—the rocky platform, divided by the great, glowing parabola of light. They stood erect as a new high priest, replacing the one Jerry had killed, crossed to bow and grovel in the radiance from their god.

The room was silent with the silence of a great tomb as the march of death began. Softly, from the silence, the drums resumed the merest whisper of their former thunderous booming. Beside him, Jerry heard the soft sobs of a girl. One of the figures swayed and threatened to fall as the platform was lowered to rest upon the floor. The other pressed close to support the drooping figure.

Now the entire directed ray of light from the round, glowing hole struck full upon them. It blinded and dazzled, yet, plain and distinct, Jerry saw at its heart the circle of blackness, the eye of the mysterious, hypnotic parabola—the entrance to what lay beyond.

The beat of the drums was hypnotic. As if in a trance he saw, at the side of the way they must go, the form of the head priest beckon them on. The two victims at

his side took one step on the path to their death. And the same stiff rigidity held Jerry as he, too, moved onward and up the golden ramp.

The drums were bearing them on. Louder they throbbed in a steady crescendo, to carry the three rigid figures a step at a time up the pathway of light.

The priest, Jerry felt more than saw, was beside them. Close ahead was the blackness that held the set stare of his eyes. One of the golden figures was before him. He saw the priest reach out to take the helmet from her head.

The movement aroused him from his numb horror. An impulse to escape surged through him; every nerve was tense and ready for a spring. He looked quickly about. The warriors were behind, the priests ready on their platform to direct them. And in the doorway, from where he first had seen this chamber, on the only way he knew that led to freedom, another figure, tall in its priestly robes, blocked the passage.

Hopeless, he knew. And then there swept through him

a wave of hate. Gone was his horror, and gone the dull deadness of brain and body. There, facing him, was the mouth of the pit, where waited a something—horrible, rapacious—demanding the lives of these people ... of Marahna ... of others—more and yet more.

No thought now of life or escape. For the moment, Jerry Foster's whole being held nothing but hot hate, and the wish for revenge.

Before him the priest was stripping the robe from the girl at his feet. She stood like a statue, a carving of purest alabaster, slim and erect in her white, slender nakedness. And the face that he saw through incredulous eyes was that of Marahna.

Marahna! The realization and quick understanding held him spellbound. She had come, had taken the robes from another poor victim ... to be with him in this, the last hour....

Marahna—a princess among these strange folk—was giving her life when another could have been in her

place. And she smiled tremulously, bravely, as her eyes locked with his, as, speechless and spellbound, he stared through the eyelets of gold.

The priest was reaching for his head-dress, Jerry tensed. The moment had come.

He was ready. As the weight left his shoulders, he dropped, with one swift movement, his golden disguise. The robe fell in folds at his feet. He stared in silence, through narrowing eyes, at the face of the head priest above him. Then, leaping straight up, he fastened one hand, sinewy, sun-browed and strong, on the white neck below the white face. They crashed back, to land on the ramp and roll, struggling, toward the edge.

Jerry's hold never slackened. He felt his fingers sink deep in the flesh. He came to his knees, then up, to hold the writhing figure at arm's length. Then, heaving with all his strength, he whipped the man into the air, to drag him in one leaping bound for the sheltering darkness beyond.

A figure was entering with him—a slim, naked figure, with glowing and worshipping eyes.

Behind them the silence was shattered. Jerry saw, as he stepped from the light, the riot of figures that surged in hysterical frenzy through the great hall. The priests were leaping among them ... the tall priest who had guarded the door was fighting his way through the mob.

Jerry loosed his quivering hand from the throat it held. He cast the figure from him. And he blinked his eyes to make them serve him in the blackness all about.

Beside him, a form, invisible in the dark, was stroking at his face, and a voice was whispering tremulously: "Cherrie ... Cherrie!"

The tumult in the great hall reached them but faintly. Jerry Foster strove desperately to focus his eyes in that darkness of utter night. A dim glow from the portal crept softly in to bring faint illumination to the farther wall. Slowly his eyes found that which they

feared yet sought.

Off in the dark, directly opposite the entrance, was a white and ghostly thing. Formless and vague, it wavered and blurred to his straining eyes. He fumbled clumsily for a match, one of his treasured store. He must see—he must know what was waiting —

The match flared to a point of brilliance in the murky gloom. It showed, on the floor where they stood, a litter of dried vegetation—food, doubtless placed there as an offering. It was dry now, and dusty, and through it there shone the bleak whiteness of bones. Beyond was the floor, and beyond that.... The whiteness that had been but a blur grew sharply distinct.

Jerry could not have told what he expected the light to disclose. Certainly it was not the heaping of coils, milk-white and ghastly, that took shape before his staring eyes. Above them a head hung in air. It was motionless—lifeless, almost—like the coiled body that held it. But the eyes, black and staring, in the bloated,

bulging head, made its poised stillness the more deadly.

Even in the dark Jerry had sensed the hypnotic spell of unseen eyes. Visible, they held him in a rigid, unreasoning terror. Unreal, unthinkable, this serpentlike horror, tremendous and ghastly in its loathsome whiteness. A dweller in the dark, used by the priests as a symbol and a threat for the ignorant folk who trusted and believed them. And it held him, stilled and stricken, in its evil spell.

The flame was scorching Jerry's hand that nervelessly opened to release the match. The man was like a statue, frozen to mental deadness. About his feet a light was playing, unseen. A bit of the dry stuff sprang brightly to yellow flame. Neither seeing nor feeling, the figure of Jerry Foster stood, held in the deadly magic of the malignant eyes.

Dimly he sensed that the prostrate body on the floor was that of Marahna. Vaguely he knew when the form of the priest took a halting step forward. The fire his match had kindled was rising about his feet. The

flames seared and stabbed with a pain that reached his dulled brain. Quivering and shaken, the body of Jerry Foster reacted again to a conscious thought. He leaped quickly as the deadly witchery left him, and he tore at the smoldering cloth about his legs.

And now he knew the thing before him for what it was. Shocking in its gigantic size, more so in the concentrated venom of its gaze, it was the flabby, scaly and crusted whiteness of the thing that filled his being with a deadly nausea. He stared with a sickened fascination at the flabby, drooping pouches beside the mouth, the distorted, bulging head and the short legs, armed with long, curving talons—legs that sprang from out the neck to clutch and tear at what the jaws might hold.

Deadly and hateful—loathsome beyond all imagining—still Jerry Foster found it was something a man could meet. Its devilish power to paralyze and still the soul of him was gone.

He snatched quickly for the gun at his belt and knelt to aim—then checked his finger on the trigger. The

figure of the priest had come between him and the monster.

The golden robe was dragging. It fell to the floor, to gleam dully in the flickering light of the fire. Against the heaping coils of white the priest was outlined, drawn, as Jerry sensed, against the protest of every fiber of his being. Yet, one stiff step at a time, he went faltering on. The hair above his white face was torn in disarray. And the face itself, so exultantly fierce in its hour of triumph, now a mask of quivering, hopeless terror.

The head of the monster came slowly to life. It raised and raised into the air. The mouth gaped open with a hoarse, sucking sound, then struck, like a whip of light, at the doomed priest.

His screams, as the thing descended upon him, rang through the roar of the forty-five. Jerry fired again where the black eyes showed above the writhing body of their prey. The head jerked backward, to tower in the darkness overhead. The mouth disgorged its contents to the floor.

Only for a shuddering instant did the monster pause. Then it launched its great bulk in a counter-attack, while the automatic poured out the rest of its futile lead.

The gun was knocked from his grasp as the great head smashed past, swerved from its aim by the blinding bullets. Jerry knew only that his knife was in his hand as the great scabrous coils closed inevitably about him.

Vaguely he heard the shouting from behind as the writhing folds engulfed him. He stabbed blindly at the scaly mass; again and again his knife ripped slashingly at the abhorrence that drew him close. Then his arm, too, was caught in the crushing loathsome embrace....

He felt no pain—the pressure alone was insufferable. His head was drawn back. Above him the horrible eyes glared into his—there was blood dripping from the jaws....

He saw it in the brilliance of a light that flashed in

blue heat overhead. There came in his ears a vast roaring of sound, a great heat-blast that scorched and burned at his face. The crushing pressure was relaxed. He went reeling to the floor, as the great coils whirled high into the air.

He was stunned by the fall, his body inert and relaxed. But he knew through it all that from somewhere above there was shrieking of gas—blue, roaring fires—a flame that tore blastingly into a writhing contortion beyond.

The tall figure of a priest was bending over him, but it was the voice of Winslow that was in his ears—a blessed, human voice—when he awoke.

"Thank God, I made it," the voice was saying, over and over. "Thank God, I found the ship and got back here in time!"

There was light within the cavern. The burning fungus was extinguished by the smothering coils that had crashed upon it, but beyond was a waving plume of yellow where a blue flame shot against a wall of

rock.

And Jerry, through the stress and riot of emotion that overwhelmed him, laughed chokingly, wildly, at the words of his companion.

"It is sodium," Winslow was saying in explanation, as he saw Jerry's eyes resting on the light. "A hydrogen flame, but there's sodium in the rocks that turns the flame yellow. I rigged up a flame-thrower of hydrogen."

"You would," Jerry gasped through hysterical laughter. "You would do just that, and make your way back to this hell just to save me—you damn fool inventor!"

He clung to Winslow, who was raising him to his feet. Marahna was beside him, robed in the golden garment of the priest. She placed her hands beside his face to turn him toward the further wall. The light was fickle, but it showed him, as it rose and fell, the blackened, swollen body of the monster, still writhing in its death struggle. And beside it, blasted and

charred, the head of the obscene sun god, severed by the cutting, obliterating blast, lay flabby and black in a silent heap.

"Rather effective," said Winslow complacently, "though I didn't have much to work with. Two small vials of my liquid and a hand generator to furnish the current. A tubular strut from the frame of the ship made the blow-pipe."

"And these?" Jerry questioned, and pointed to the priest's vestments that Winslow still wore.

"Oh, it was all quiet up above," said the inventor, "and I came down the rope. But there was one of them waiting at the bottom. He didn't need these any more when I left, so I took them to help get about—"

He stopped, to cross quickly and pick up the flame-thrower as the flame died away. It roared as he worked at the mechanism, then dwindled again. Its light, for an instant, was reflected in a liquid on the floor.

"Broken!" said Winslow in an anguished voice. "The vials are gone—smashed! And I counted on this to hold off the mob, to get us safely out...."

He regarded the instrument with silent dismay. The blue flame, as he held it, flickered and died.

"Not so good!" said Jerry slowly. He stopped to retrieve the knife. This, he reflected, was their sole weapon of defense. In the dim light his eyes met with Winslow's in mutual comprehension of their plight.

There were caverns beyond, dark and forbidding. Did they lead to the outer world? Or, instead, was it not probable that they went to some deep, subterranean dens, from which this monster had learned to come at the priests' summons? Jerry put from his mind all thought of escape in that direction.

"And Marahna, too," he told Winslow. "What will become of her?"

The girl got the essence of the question. Fumbling for phrases that they knew, she made them believe that

she was safe. Her people, she told them, would protect her.

"Yes," Jerry agreed. "I guess that's right. She's a princess, you know," he reminded Winslow, "and the great mass of the people look up to her. Only the priests and warrior gangs will be opposed. But how can we get through them?"

The question was unanswered.

"We've got to knock them cold some way," said the inventor. "Got to give them a fright that will last till they let us get through. Once at the big shaft where we came down, we can make our getaway. But how to do it...." His voice died away in dismal thought.

Jerry's eyes were casting about. The priest's robe? No, not good enough. It had brought Winslow through, but it couldn't take them back. Marahna? No help there: she had enough to do to protect herself from the fury of the priests.

His eyes rested again on the steaming, blackened

mass that still showed the horrible features that had marked the head of the monster. The sun god! There was an idea there.

"Come!" he said to Winslow, and walked swiftly across to the severed head.

He had to steel his nerves before he could lay hands upon the vile thing. The paws were still attached behind the head. He took a grip on one and pulled. The great mass moved.

"I don't get the idea," said Winslow.

"Nor I," Jerry admitted, "but there's an idea here." His thoughts were racing in the moment's silence.

"I've got it," he shouted. "I've got it! If only I can make Marahna understand!" He led the girl nearer to the door, where his signs could be seen more plainly.

"You," he told her, "go out there." He pointed to the place where the priests had stood. "Tell your people"—he took the attitude of the orator declaiming

to his audience—"we have come here from the sun." Again his signs were plain. Marahna nodded. This plainly was literal truth to her.

"Tell them," he continued earnestly, "we have saved them from this thing. Tell them it was no sun god, but a monster that the priests had kept. Monster!" he exclaimed, and pointed to the head and to the body that still writhed and jerked spasmodically. "No god—no!" And again the girl showed her understanding. Her eyes were glowing.

"Then," said Jerry, indicating Winslow and himself, "we will take the head that they have worshipped, and we'll drag it out and throw it to the priests." His gestures were graphic. The girl nodded her head in an ecstasy of comprehension.

"And then," Jerry added softly for Winslow's hearing, "we'll beat it. And, with luck, we'll make it safe."

"There's a chance," said Winslow softly, "there's a chance—and that's all we ask."

It's up to you, Marahna," Jerry told her. His words were meaningless, but the tone sufficed. She drew herself proudly erect, wrapped herself closely in the robe of braided gold, and stepped firmly and fearlessly through the portal and down toward the platform of the priests.

The two men watched from the shadows. Beyond the outline of the platform they saw the warrior clans, a phalanx of protecting bodies. And beyond, drawn back in huddled consternation, were masses of white-faced people—Marahna's people—who listened, now, in wondering silence to their princess.

Marahna made her way slowly to the platform's edge. Of all the countless ones to have gone that road, she was the first ever to return. She stood silent, while her eyes found their way scornfully over the enemy below. Then looking beyond them, she began to speak.

Her soft voice echoed liquidly throughout the room. She gestured, and Jerry knew that she was giving them the message.

From the priests there came once a hoarse, inarticulate growl of hate and unbelief. She silenced them with her hand. She pointed to the heavens, and she told them of the sun and of the two who were true children of the sun, who had come to save them from their false god.

Her voice rose as she told her people in impassioned tones that which she had seen. And she was shouting above the tumult of the priests and pointing directly at them as she made the roof echo with the message: "*Oong devah! Oong devah!*"

"The god is dead," translated Jerry. "*Devah* means death; she said that of herself before we left. Come on!" he shouted, and laid-hold of one great claw. "It's our turn now."

Winslow was tugging at the other foot. Between them they dragged into the light the obscene burden. Down the long ramp they took it and off upon the platform of the priests, where Marahna waited.

The priests, as Jerry's quick glance showed, were

milling wildly about. It seemed that a charge was soon to follow, but the commotion ceased as the two men come upon the platform, hauling between them the great scorched head of "Oong." The vast hall was without movement or sound as they made their way out to the front. Jerry stood erect and faced the crowd.

He pointed, as had Marahna, toward the sun somewhere above those thick masses of rock; he traced it in its course across the sky; he pointed to Winslow and himself. And in loudest tones he roared throughout the room his message. "Oong," he shouted, "*Oong devah!*"

"I'll count three," he whispered in the utter silence. "Then let 'er go!"

Again he took a firm hold on the flabby paw.

"One," he whispered, and swung his body with the word. "Two ... and *three!*"

The men heaved mightily upon the gruesome horror.

The head swung ghastly in scorched whiteness into the air. The dead jaws fell open as it crashed downward among the huddled, stricken priests.

"This way!" commanded Winslow. He had been carefully appraising the openings in the crowd. "And don't hurry! Remember, you're a god to them—or something a darn sight worse."

Heads proudly erect, the two strode firmly down the pathway of golden light. The room was silent as the few they met fell back in cringing fear. Slowly, interminably, the long triumphal march was made across the rocky cavern of the moon.

Not till they reached the portal did the silence break. The shrieks of the priests and the clashing of copper were behind them, as they vanished with steady steps from out the room.

"Now run!" ordered Winslow. "Run as if the devils from hell were after you—and I think they are!" The two tore madly down the corridor whose double rows of brightness made possible their utmost speed.

There was the narrowing of the passage—Jerry remembered it—where they came out at the foot of the great shaft, the dead throat of the volcano. Behind them the shrieks and clamor echoed close. A rope was dangling from far up at the top.

Jerry leaped for it before he recalled the condition of his arm. In the excitement of the encounter he had forgotten that the arm was still in no shape for a long hand-over-hand climb.

"I can't make it," he said, and looked about quickly. There were baskets of fungus growth, already dried from the heat of the mid-day sun that had shone where it grew. He dragged one to the narrow part of the tunnel. Winslow tugged at another and threw it up as a barricade. A chalk-white figure in copper sheathing was clambering upon it as he worked at another of the nets.

Jerry let go the fiber basket he was dragging and drew his knife as he sprang to meet the assault. A sharp cutting edge was unknown to these workers in copper. Jerry slipped under the raised bludgeoning

copper weapon to plunge the knife into a white throat. Then, without a look at the body he helped Winslow, struggling with another load.

They completed the barricade. A heap of fungus made a raised place where Jerry leaped. Commanding the top of the pile that blocked the choked throat of the passage, he was ready for the next figure that leaped wildly up.

It would take them a while, Jerry saw, to learn of this scintillant death that struck at them from close quarters. His knife flashed again and again as he took the men one at a time and let their limp bodies roll back to the passage beyond.

The assault was checked when Jerry shouted to his companion. "Tie the rope around me," he ordered, "up under my arms ... then you go on up. When you get there pull up—and for the Lord's sake pull fast!"

"Go on," he shouted. "I can hold them for a while—" He turned swiftly to take a leaping body upon the red point of his knife.

He felt the rope about him as he fought, knew by its twitching when Winslow started the long climb, and prayed dumbly for strength to hold his weak fortress till the other could hoist himself up to the top.

He was fighting blindly as they came on in endless succession, the figures of frenzied priests leaping grotesquely beyond. Only the strategic position he had taken allowed him to turn the wild assault again and again. They could only reach him by ones and twos, but the end must come soon. There were priests tearing at the foot of the barricade.... The cold winds that came down from above revived him, but it helped the figures ripping at the fiber cords. The dry fungus fragments whirled gaily away and down the passage in the wind.

The wind! The draft was blowing from him, directly upon his attackers. Jerry struggled and clinched with another that bounded beside him, and knew as he fought that a weapon was at hand. His knife found the lower edge of copper, and the figure screamed as he rolled it down the slope. He slipped the knife into his left hand as he fumbled with his right.

His precious matches! He struck one on the rock; it broke in his trembling fingers. Another—there were so few left. He drew it with infinite care on the surface of rock. The figures below tore in frenzy at the weakening barricade, while yet others stood waiting at this sign of some new form of magic.

They shouted again, as they had when, those long days ago, he had lighted a cigarette before their horrified gaze. Jerry shielded the tiny blaze in his hand to bring it beneath a papery leaf beside him.

The flame flashed and dwindled. He dared not drop back to set fire to the base of the heap. But even in the exhaustion and strain of the moment Jerry Foster still knew the value of the showman's tricks in reaching the fears of these white-faced fighters.

With grandiloquent gesture he raised another of the tindery fragments and ignited it from the first. Another, and he had the beginning of a fire. He lit another piece, and, when he had it blazing, dropped it behind him and kept on with the show.

A large piece became a flaming torch, and he waved it before him and laughed to see the warriors cringe. A cloud of smoke was billowing about him—he leaped to safety through a rising wall of flame.

The rear slope of the barricade became a furnace; the wind behind him swept the smoke clouds down the passage. He heard, and sank back weakly on the ground as it came to him, the screaming riot where a mob of terrified warriors fought and struck to turn the horde that clamored behind them and pushed them on. The blast roared over the heaped fuel and poured downward from the crest. The noise of the retreat went silent in the distance.

Spent and exhausted, Jerry Foster lay panting upon the stone floor. The breath of cold and life came down the long shaft from the crater. Had Winslow gained the top? Was he equal to the climb? Jerry hardly felt the jerking of the rope about his shoulders, but he knew as, in frantic haste, it drew him scraping up the long side of the shaft.

The biting cold above revived him, and again a scene

of desolation was spread before his eyes. Winslow fumbled with the knots and released him from the rope.

"Come on!" he shouted, and extended a helping hand as they leaped and raced across the rocky floor.

Jerry again was vividly, strongly alive as the cold winds swept him. He leaped hugely through the whirling wisps of dried out vegetation—the sun had stripped the surface of every living thing. Again the rocky slopes rose naked in the rosy light of evening. The sun was hidden below a distant range of jagged hills. The long night was begun.

"You're going the wrong way," Jerry shouted. "We left it over there." He stopped to point where the sun had set. "See, that's where we fought the beasts—"

"Come on!" repeated Winslow. "Hurry! We mustn't lose out now. I flew the ship over this way while I was up here before."

A ridge of rock cut off the view where Winslow

pointed. "Bully for you!" Jerry shouted and turned to follow. They stopped as the slope ahead, from its multitude of honeycomb caverns, erupted men.

The priests were ahead, and behind them swarmed their men. Vindictive and revengeful, the wily enemy was fighting to the end. The two stopped in consternation.

"What's the use!" demanded Jerry. His voice was tired, utterly hopeless. "And the ship's right over there...."

"A million miles away," said Winslow slowly, "as far as we're concerned." The army was sweeping down the long slope: they had found their quarry. There were other figures, too, pouring from the throat of the volcano—white, naked figures that swarmed in growing numbers and rushed across upon them from the rear.

"Trapped," said Jerry Foster savagely, "and we almost made it." He rose wearily to his feet. "We'll take it standing."

The armored warriors were approaching; in leaping triumph they raced to be the first ones at the death. The shouts of the priests were ringing encouragement in their ears.

But the leaders from the rear were nearer. One deep breath Jerry drew as he turned to meet them. Then stared, astonished, as the figures swept past. They streamed by in confusion. They were armed with rocks, with clubs or copper metal—some even carried bars of gold above their heads. They came in a great swarm that swept past and beyond them. And they met, like an engulfing wave, the bounding figures of the men in copper. Smothered and lost were the warriors in the horde that poured increasingly on.

The wave, before Jerry's eyes, swept on over the crest, while he still stood in amazed unbelief at the battle that raged.

It was Marahna who brought understanding. He turned to see her kneel in sobbing, thankful abasement at his feet.

Marahna! Her people! She had saved them! There was time needed for the full force of the truth to banish the hopeless despair from his heart. Then he stooped to raise the crouching figure with arms that were suddenly strong.

The pale rose light of the departed sun above shone softly within a rocky valley of the moon. It tipped the tall crags with lavender hues, and it touched with soft gleaming reflections a blunted cylinder of aluminum alloy.

The valley was silent, save for the hushed whispers of wondering thousands who peopled the enclosing hills, and the rushing roar from the cylinder itself where the inventor was testing his machine.

There were figures in priestly robes—scores of them—and they were surrounded by a white throng that, silent and watchful, held them captive.

Beyond, in the open, where bare rock made a black rolling floor, there were two who stood alone. The golden figure of a girl, and beside her, Jerry Foster, in

wordless indecision.

Behind him was the ship. Its muffled thunder came softly to his unheeding ears. He looked at the girl steadily, thoughtfully.

Gone was all trace of her imperious dignity. The Princess Marahna was now all woman. And Jerry, looking into her dark eyes, read plainly the yearning and adoration in their depths. The Princess Marahna had forgotten her deference to the god in her love for the man. The tale was told in her flushed face, openly, unashamed.

And his gray eyes were thoughtful and tender as he gazed into hers. He was thinking, was Jerry Foster, of many things. And he was weighing them carefully. His hand clasped and unclasped at something safely hidden in his pocket. He had taken it from his pack; he had wanted something for Marahna, something she would treasure.

And now she was offering him herself. He could take her with him, take her to that far-off world that she

never dreamed existed. He could show her the things of that world, its wonders and beauties. He could train her in its ways. He would watch over her, love her... And she would be miserable and heartsick for the sight of this awful desolation. He knew it—he told himself it was the truth—and he hated himself for the telling.

The voice of Winslow aroused him. The inventor had come from his ship. "We had better be starting," he said.

The slim figure of the girl in her robe of pure gold trembled visibly. She knew, it was plain, the import of the words. She spoke rapidly, beseechingly, in her own tongue. The words were liquid music in the air. Then, realizing their impotence, she resorted to her poor vocabulary of their own strange sounds.

"No!" she said, and shook her head vehemently. "No—no!"

She motioned to wait, and she called loud and clear across the silence to her own people. There was a stir

about the priests. One in the robes and head-dress of the high priest was brought forward, led by two others of her men. They stopped a few steps from her and bowed low.

Again she called, and the leaders among the vast throng came, too, and made their obeisance before her.

She turned then to Jerry. And now it was Marahna, Princess of the Moon, who stood quiet and poised before him. The light, he saw, made soft wavelets of radiance in her hair, and her eyes were still glowing and tender. She stepped forward toward the priest.

The helmet of the sun god was upon his head. It marked him, Jerry knew, as the master of their world. True, they had bowed in submission to that other master, whose vile head lay horrible and harmless on the floor of the great hall—they had believed in the commands the priests had pretended to receive from him—but this emblem on the helmet marked the leader of the race, the master of this world, for these simple folk.

Marahna reached her slim hands and lifted the thing of gold. She turned, and held it above the startled eyes of Jerry Foster, and she placed it upon his head with all the dignity that became a queen. A word from her, and the men before him dropped in humbleness to the ground. The Princess Marahna was among them in honoring salutation to their king.

Jerry was beyond speech. Not so Winslow. "It looks to me," he said dryly, "as if you were being offered the kingdom of the earth—I mean the moon. Think it over, Jerry—think it over."

And Jerry Foster thought it over, deeply and soberly. He could rule this people, he and Marahna, rule in peace and quiet and comfort. He could bring them knowledge and wisdom of infinite help; he could make their new civilization a measure of advancement for a whole race. He could teach them, train them, instruct them. And he and Marahna—there would be children who would be princes born—could be happy—for a time. And then ... and then he would be old. Old and lonely for his kind, hungering and longing for his own people. As Marahna would be on earth, so would he

be here....

His decision was formed. And with it he knew he must not hurt the heart of Marahna. She loved him, Jerry Foster, the man. He must leave her as Jerry Foster, the god, child of the sun. He stood suddenly to his full height, and who shall say that for a moment the man did not approach the stature of divinity—for he was wholly kind.

He placed a hand upon the head of the kneeling girl before him. He held her in her submissive pose, then, turning to the waiting men, he spoke in measured tones.

"I thank you," he said, and the words came from a full heart, "but my place is not here. I leave with you one more worthy."

Before their wondering gaze he removed the glowing circlet from his head; he leaned to place it on the head of Marahna, humbled before him. With strong hands he raised her to her feet. His look, so tender yet reserved, was full of meaning. She followed his

every sign.

He waved once toward the sun, hidden behind the distant hills: he pointed again to Winslow and himself and to their shining ship: and again he marked the going of the sun. His meaning was plain—these children of the sun must return to their far-off home.

He turned now to Marahna. In his hand was the object he had taken from his pack. It was a treasured thing, this locket of platinum on its thin and lacy chain; it had been his mother's, and he thought of her now as he opened the clasp to show his own face framed within the oval. His mother—she had worn this. And she would have approved, he knew, of its disposal.

Gravely he faced Marahna. He showed her the picture within the case, then held it aloft where all might see. He closed it and taught her the pressure that released the spring. Then, with gentle dignity that made of the gesture a rite, he placed the chain about the neck of Princess Marahna—Queen, now, of the People of the Moon. And he knew that he gave into her keeping

their only relic of a being from the sun. It marked her beyond all future question with a symbol of mastery. And it made of him a god.

And even a queen may not aspire to such an one.

It was well that Winslow's hand was there to guide him as he walked with unseeing eyes toward the ship.

Time may lose at times all meaning and measure—moments become timeless. It seemed ages to Jerry Foster when Winslow spoke in casual tones. "I'm going straight up," he said, above the generator's roar. "Then we'll swing around above the other side. We'll follow the sun—make the full circle of the moon before we start."

But Jerry neither thought nor heard. His eyes were close to a window of thick glass. Below him was a shrinking, dwindling landscape, wind-swept and desolate.

There was a multitude of faces, turned worshipping toward the sky. On one, who stood apart in tiny

loneliness, his vision centered. He watched and strained his aching eyes until the figure was no more. Only the pale rose of a dying sun, and a torn, volcanic waste that tugged strangely at his heart.

"Yes," he answered mechanically, "yes, we'll go round with the sun ... a couple of sun gods."

He laughed strangely as he regarded his companion.

If Winslow wondered at the weariness in the voice he made no sign. He was busy with a rheostat that made thunderous roaring of the blast behind their ship: that swung them in a sweeping arc through velvet skies, away from the far side of the moon, to follow the path of the setting sun—homeward bound.

July 1930

#33 Beyond The Heavside Layer, By Sterner St. Paul Meek:

For eighty vertical Miles Carpenter and Bond blasted their way—only to be trapped by the extraordinary monsters of the heavside layer.

Aproximate word count: 8,200

Bigotry:

Warnings:

- - -

McQuarrie, the City Editor, looked up as I entered his office.

"Bond," he asked, "do you know Jim Carpenter?"

"I know him slightly," I replied cautiously. "I have met him several times and I interviewed him some years ago when he improved the Hadley rocket motor. I can't claim a very extensive acquaintance with him."

"I thought you knew him well. It is a surprise to me to find that there is any prominent man who is not an especial friend of yours. At any rate you know him as well as anyone of the staff, so I'll give you the assignment."

"What's he up to now?" I asked.

"He's going to try to punch a hole in the heaviside layer."

"But that's impossible," I cried. "How can anyone...."

My voice died away in silence. True enough, the idea of trying to make a permanent hole in a field of magnetic force was absurd, but even as I spoke I remembered that Jim Carpenter had never agreed to the opinion almost unanimously held by our scientists as to the true nature of the heaviside layer.

"It may be impossible," replied McQuarrie dryly, "but you are not hired by this paper as a scientific consultant. For some reason, God alone knows why, the owner thinks that you are a reporter. Get down

there and try to prove he is right by digging up a few facts about Carpenter's attempt. Wire your stuff in and Peavey will write it up. On this one occasion, please try to conceal your erudition and send in your story in simple words of one syllable which uneducated men like Peavey and me can comprehend. That's all."

He turned again to his desk and I left the room. At one time I would have come from such an interview with my face burning, but McQuarrie's vitriol slid off me like water off a duck's back. He didn't really mean half of what he said, and he knew as well as I did that his crack about my holding my job with the Clarion as a matter of pull was grossly unjust. It is true that I knew Trimble, the owner of the Clarion, fairly well, but I got my job without any aid from him. McQuarrie himself hired me and I held my job because he hadn't fired me, despite the caustic remarks which he addressed to me. I had made the mistake when I first got on the paper of letting McQuarrie know that I was a graduate electrical engineer from Leland University, and he had held it against me from that day on. I

don't know whether he really held it seriously against me or not, but what I have written above is a fair sample of his usual manner toward me.

In point of fact I had greatly minimized the extent of my acquaintance with Jim Carpenter. I had been in Leland at the same time that he was and had known him quite well. When I graduated, which was two years after he did, I worked for about a year in his laboratory, and my knowledge of the improvement which had made the Hadley rocket motor a practicability came from first hand knowledge and not from an interview. That was several years before but I knew that he never forgot an acquaintance, let alone a friend, and while I had left him to take up other work our parting had been pleasant, and I looked forward with real pleasure to seeing him again.

Jim Carpenter, the stormy petrel of modern science! The eternal iconoclast: the perpetual opponent! He was probably as deeply versed in the theory of electricity and physical chemistry as any man alive, but it pleased him to pose as a "practical" man who knew next to nothing of theory and who despised the little he did know. His great delight was to experimentally smash the most beautifully constructed theories which were advanced and taught in the colleges and universities of the world, and when he couldn't smash them by experimental evidence, to attack them from the standpoint of philosophical reasoning and to twist around the data on which they were built and make it prove, or seem to prove, the exact opposite of what was generally accepted.

No one questioned his ability. When the ill-fated Hadley had first constructed the rocket motor which bears his name it was Jim Carpenter who made it practical. Hadley had tried to disintegrate lead in order to get his back thrust from the atomic energy which it contained and proved by apparently

unimpeachable mathematics that lead was the only substance which could be used. Jim Carpenter had snorted through the pages of the electrical journals and had turned out a modification of Hadley's invention which disintegrated aluminum. The main difference in performance was that, while Hadley's original motor would not develop enough power to lift itself from the ground, Carpenter's modification produced twenty times the horsepower per pound of weight of any previously known generator of power and changed the rocket ship from a wild dream to an everyday commonplace.

When Hadley later constructed his space flyer and proposed to visit the moon, it was Jim Carpenter who ridiculed the idea of the attempt being successful. He proposed the novel and weird idea that the path to space was not open, but that the earth and the atmosphere were enclosed in a hollow sphere of impenetrable substance through which Hadley's space flyer could not pass. How accurate were his prognostications was soon known to everyone. Hadley built and equipped his flyer and started off on what he

hoped would be an epoch making flight. It was one, but not in the way which he had hoped. His ship took off readily enough, being powered with four rocket motors working on Carpenter's principle, and rose to a height of about fifty miles, gaining velocity rapidly. At that point his velocity suddenly began to drop.

He was in constant radio communication with the earth and he reported his difficulty. Carpenter advised him to turn back while he could, but Hadley kept on. Slower and slower became his progress, and after he had penetrated ten miles into the substance which hindered him, his ship stuck fast. Instead of using his bow motors and trying to back out, he had moved them to the rear, and with the combined force of his four motors he had penetrated for another two miles. There he insanely tried to force his motors to drive him on until his fuel was exhausted.

He had lived for over a year in his space flyer, but all of his efforts did not serve to materially change his position. He had tried, of course, to go out through his air locks and explore space, but his strength, even although aided by powerful levers, could not open the

outer doors of the locks against the force which was holding them shut. Careful observations were continuously made of the position of his flyer and it was found that it was gradually returning toward the earth. Its motion was very slight, not enough to give any hope for the occupant. Starting from a motion so slow that it could hardly be detected, the velocity of return gradually accelerated; and three years after Hadley's death, the flyer was suddenly released from the force which held it, and it plunged to the earth, to be reduced by the force of its fall to a twisted, pitiful mass of unrecognizable junk.

The remains were examined, and the iron steel parts were found to be highly magnetized. This fact was seized upon by the scientists of the world and a theory was built up of a magnetic field of force surrounding the earth through which nothing of a magnetic nature could pass. This theory received almost universal acceptance, Jim Carpenter alone of the more prominent men of learning refusing to admit the validity of it. He gravely stated it as his belief that no magnetic field existed, but that the heaviside layer

was composed of some liquid of high viscosity whose density and consequent resistance to the passage of a body through it increased in the ratio of the square of the distance to which one penetrated into it.

There was a moment of stunned surprise when he announced his radical idea, and then a burst of Jovian laughter shook the scientific press. Carpenter was in his glory. For months he waged a bitter controversy in the scientific journals and when he failed to win converts by this method, he announced that he would prove it by blasting a way into space through the heaviside layer, a thing which would be patently impossible were it a field of force. He had lapsed into silence for two years and his curt note to the Associated Press to the effect that he was now ready to demonstrate his experiment was the first intimation the world had received of his progress.

[?] drew expense money from the cashier and boarded the Lark for Los Angeles. When I arrived I went to a hotel and at once called Carpenter on the telephone.

"Jim Carpenter speaking," came his voice presently.

"Good evening, Mr. Carpenter," I replied, "this is Bond of the San Francisco Clarion."

I would be ashamed to repeat the language which came over that telephone. I was informed that all reporters were pests and that I was a doubly obnoxious specimen and that were I within reach I would be promptly assaulted and that reporters would be received at nine the next morning and no earlier or later.

"Just a minute, Mr. Carpenter," I cried as he neared the end of his peroration and was, I fancied, about to slam up the receiver. "Don't you remember me? I was at Leland with you and used to work in your laboratory in the atomic disintegration section."

"What's your name?" he demanded.

"Bond, Mr. Carpenter."

"Oh, First Mortgage! Certainly I remember you.

Mighty glad to hear your voice. How are you?"

"Fine, thank you, Mr. Carpenter. I would not have ventured to call you had I not known you. I didn't mean to impose and I'll be glad to see you in the morning at nine."

"Not by a long shot," he cried. "You'll come up right away. Where are you staying?"

"At the El Rey."

"Well, check out and come right up here. There's lots of room for you here at the plant and I'll be glad to have you. I want at least one intelligent report of this experiment and you should be able to write it. I'll look for you in an hour."

"I don't want to impose—" I began; but he interrupted.

"Nonsense, glad to have you. I needed someone like you badly and you have come just in the nick of time. I'll expect you in an hour."

he receiver clicked and I hastened to follow his instructions. A ringside seat was just what I was looking for. It took my taxi a little over an hour to get to the Carpenter laboratory and I chuckled when I thought of how McQuarrie's face would look when he saw my expense account. Presently we reached the edge of the grounds which surrounded the Carpenter laboratory and were stopped at the high gate I remembered so well.

"Are you sure you'll get in, buddy?" asked my driver.

"Certainly," I replied. "What made you ask?"

"I've brought three chaps out here to-day and none of them got in," he answered with a grin. "I'm glad you're so sure, but I'll just wait around until you are inside before I drive away."

I laughed and advanced to the gate. Tim, the old guard, was still there, and he remembered and welcomed me.

"Me ordhers wuz t' let yez roight in, sor," he said as

he greeted me. "Jist lave ye'er bag here and Oi'll have ut sint roight up."

I dropped my bag and trudged up the well remembered path to the laboratory. It had been enlarged somewhat since I saw it last and, late though the hour was, there was a bustle in the air and I could see a number of men working in the building. From an area in the rear, which was lighted by huge flood lights, came the staccato tattoo of a riveter. I walked up to the front of the laboratory and entered. I knew the way to Carpenter's office and I went directly there and knocked.

"Hello, First Mortgage!" cried Jim Carpenter as I entered in response to his call. "I'm glad to see you. Excuse the bruskeness of my first greeting to you over the telephone, but the press have been deviling me all day, every man jack of them trying to steal a march on the rest. I am going to open the whole shebang at nine to-morrow and give them all an equal chance to look things over before I turn the current on at noon. As soon as we have a little chat, I'll show you over the works."

After half an hour's chat he rose. "Come along, First Mortgage," he said, "we'll go out and look the place over and I'll explain everything. If my ideas work out, you'll have no chance to go over it to-morrow, so I want you to see it now."

I had no chance to ask him what he meant by this remark, for he walked rapidly from the laboratory and I perforce followed him. He led the way to the patch of lighted ground behind the building where the riveting machine was still beating out its monotonous cacaphony and paused by the first of a series of huge reflectors, which were arranged in a circle.

"Here is the start of the thing," he said. "There are two hundred and fifty of these reflectors arranged in a circle four hundred yards in diameter. Each of them is an opened parabola of such spread that their beams will cover an area ten yards in diameter at fifty miles above the earth. If my calculations are correct they should penetrate through the layer at an average speed of fifteen miles per hour per unit, and by two o'clock to-morrow afternoon, the road to space should be open."

"What is your power?" I asked.

"Nothing but a concentration of infra-red rays. The heaviside layer, as you doubtless know, is a liquid and, I think, an organic liquid. If I am right in that thought, the infra-red will cut through it like a knife through cheese."

"If it is a liquid, how will you prevent it from flowing back into the hole you have opened?" I asked.

"When the current is first turned on, each reflector will bear on the same point. Notice that they are moveable. They are arranged so that they move together. As soon as the first hole is bored through, they will move by clockwork, extending the opening until each points vertically upward and the hole is four hundred yards in diameter. I am positive that there will be no rapid flow even after the current is turned off, for I believe that the liquid is about as mobile as petroleum jelly. Should it close, however, it would take only a couple of hours to open it again to allow the space flyer to return."

"What space flyer?" I demanded quickly.

"The one we are going to be on, First Mortgage," he replied with a slight chuckle.

e?" I cried, aghast.

"Certainly. We. You and I. You didn't think I was going to send you alone, did you?"

"I didn't know that anyone was going."

"Of course. Someone has to go; otherwise, how could I prove my point? I might cut through a hundred holes and yet these stiff-necked old fossils, seeing nothing, would not believe. No, First Mortgage, when those arcs start working to-morrow, you and I will be in a Hadley space ship up at the bottom of the layer, and as soon as the road has been opened, two of the lamps will cut off to allow us through. Then the battery will hold the road open while we pass out into space and return."

"Suppose we meet with Hadley's fate?" I demanded.

"We won't. Even if I am wrong—which is very unlikely—we won't meet with any such fate. We have two stern motors and four bow motors. As soon as we meet with the slightest resistance to our forward progress we will stop and have twice the power plus gravity to send us earthwards. There is no danger connected with the trip."

"All the same—" I began.

"All the same, you're going," he replied. "Man alive, think of the chance to make a world scoop for your paper! No other press man has the slightest inkling of my plan and even if they had, there isn't another space flyer in the world that I know of. If you don't want to go, I'll give some one else the chance, but I prefer you, for you know something of my work."

I thought rapidly for a moment. The chance was a unique one and one that half the press men in San Francisco would have given their shirts to get. I had had my doubts of the accuracy of Jim Carpenter's reasoning while I was away from him, but there was no resisting the dynamic personality of the man when

in his presence.

"You win," I said with a laugh. "Your threat of offering some of my hated rivals a chance settled it."

"Good boy!" he exclaimed, pounding me on the back. "I knew you'd come. I had intended to take one of my assistants with me, but as soon as I knew you were here I decided that you were the man. There really ought to be a press representative along. Come with me and I'll show you our flyer."

The flyer proved to be of the same general type as had been used by Hadley. It was equipped with six rocket motors, four discharging to the bow and two to the stern. Any one of them, Carpenter said, was ample for motive power. Equilibrium was maintained by means of a heavy gyroscope which would prevent any turning of the axis of its rotation. The entire flyer shell could be revolved about the axis so that oblique motion with our bow and stern motors was readily possible. Direct lateral movement was provided for by valves which would divert a portion of the discharge of either a bow or stern motor out through side vents

in any direction. The motive power, of course, was furnished by the atomic disintegration of powdered aluminum. The whole interior, except for the portion of the walls, roof and floor, which was taken up by vitriolene windows, was heavily padded.

At nine the next morning the gates to the enclosure were thrown open and the representatives of the press admitted. Jim Carpenter mounted a platform and explained briefly what he proposed to do and then broke the crowd up into small groups and sent them over the works with guides. When all had been taken around they were reassembled and Carpenter announced to them his intention of going up in a space flyer and prove, by going through the heaviside layer, that he had actually destroyed a portion of it. There was an immediate clamor of applications to go with him. He laughingly announced that one reporter was all that he could stand on the ship and that he was taking one of his former associates with him. I could tell by the envious looks with which I was favored that any popularity I had ever had among my associates was gone forever. There was little time to

think of such things, however, for the hour for our departure was approaching, and the photographers were clamoring for pictures of us and the flyer.

We satisfied them at last, and I entered the flyer after Carpenter. We sealed the car up, started the air conditioner, and were ready for departure.

"Scared, Pete?" asked Carpenter, his hand on the starting lever.

I gulped a little as I looked at him. He was perfectly calm to a casual inspection, but I knew him well enough to interpret the small spots of red which appeared on his high cheekbones and the glitter in his eye. He may not have been as frightened as I was but he was laboring under an enormous nervous strain. The mere fact that he called me "Pete" instead of his usual "First Mortgage" showed that he was feeling pretty serious.

"Not exactly scared," I replied, "but rather uneasy, so to speak."

He laughed nervously.

"Cheer up, old man! If anything goes wrong, we won't know it. Sit down and get comfortable; this thing will start with a jerk."

He pulled the starting lever forward suddenly and I felt as though an intolerable weight were pressed against me, glueing me to my seat. The feeling lasted only for a moment, for he quickly eased up on the motor, and in a few moments I felt quite normal.

"How fast are we going?" I asked.

"Only two hundred miles an hour," he replied. "We will reach the layer in plenty of time at this rate and I don't want to jam into it. You can get up now."

I rose, moved over to the observation glass in the floor, and looked down. We were already five or ten miles above the earth and were ascending rapidly. I could still detect the great circle of reflectors with which our way was to be opened.

"How can you tell where these heat beams are when they are turned on?" I asked. "Infra-red rays are not visible, and we will soon be out of sight of the reflectors."

"I forgot to mention that I am having a small portion of visible red rays mixed with the infra-red so that we can spot them. I have a radio telephone here, working on my private wavelength, so that I can direct operations from here as well as from the ground—in fact, better. If you're cold, turn on the heater."

The friction of the flyer against the air had so far made up for the decreasing temperature of the air surrounding us, but a glance at the outside thermometer warned me that his suggestion was a wise one. I turned a valve which diverted a small portion of our exhaust through a heating coil in the flyer. It was hard to realize that I was actually in a rocket space ship, the second one to be flown and that, with the exception of the ill-fated Hadley, farther from the earth than any man had been before. There was no sensation of movement in that hermetically sealed flyer, and, after the first few moments, the

steady drone of the rocket motor failed to register on my senses. I was surprised to see that there was no trail of detritus behind us.

"You can see our trail at night," replied Carpenter when I asked him about it, "but in daylight, there is nothing to see. The slight luminosity of the gasses is hidden by the sun's rays. We may be able to see it when we get out in space beyond the layer, but I don't know. We have arrived at the bottom of the layer now, I believe. At any rate, we are losing velocity."

I moved over to the instrument board and looked. Our speed had dropped to one hundred and ten miles an hour and was steadily falling off. Carpenter pulled the control lever and reduced our power. Gradually the flyer came to a stop and hung poised in space. He shut off the power an instant and at once our indicator showed that we were falling, although very slowly. He promptly reapplied the power, and by careful adjustment brought us again to a dead stop.

"Ready to go," he remarked looking at his watch, "and just on time, too. Take a glass and watch the ground. I

am going to have the heat turned on."

I took the binoculars he indicated and turned them toward the ground while he gave a few crisp orders into his telephone. Presently from the ground beneath us burst out a circle of red dots from which long beams stabbed up into the heavens. The beams converged as they mounted until at a point slightly below us, and a half-mile away they became one solid beam of red. One peculiarity I noticed was that, while they were plainly visible near the ground, they faded out, and it was not until they were a few miles below us that they again became apparent. I followed their path upward into the heavens.

"Look here, Jim!" I cried as I did so. "Something's happening!"

He sprang to my side and glanced at the beam.

"Hurrah!" he shouted, pounding me on the back. "I was right! Look! And the fools called it a magnetic field!"

Upward the beam was boring its way, but it was almost concealed by a rain of fine particles of black which were falling around it.

"It's even more spectacular than I had hoped," he chortled. "I had expected to reduce the layer to such fluidity that we could penetrate it or even to vaporize it, but we are actually destroying it! That stuff is soot and is proof, if proof be needed, that the layer is an organic liquid."

He turned to his telephone and communicated the momentous news to the earth and then rejoined me at the window. For ten minutes we watched and a slight diminution of the black cloud became apparent.

"They're through the layer," exclaimed Carpenter. "Now watch, and you'll see something. I'm going to start spreading the beam."

He turned again to his telephone, and presently the beam began to widen and spread out. As it did so the dark cloud became more dense than it had been before. The earth below us was hidden and we could

see the red only as a dim murky glow through the falling soot. Carpenter inquired of the laboratory and found that we were completely invisible to the ground, half the heavens being hidden by the black pall. For an hour the beam worked its way toward us.

"The hole is about four hundred yards in diameter right now," said Carpenter as he turned from the telephone. "I have told them to stop the movement of the reflectors, and as soon as the air clears a little, we'll start through."

It took another hour for the soot to clear enough that we could plainly detect the ring of red light before us. Carpenter gave some orders to the ground, and a gap thirty yards wide opened in the wall before us. Toward this gap the flyer moved slowly under the side thrust of the diverted motor discharge. The temperature rose rapidly as we neared the wall of red light before us. Nearer we drew until the light was on both sides of us. Another few feet and the flyer shot forward with a jerk that threw me sprawling on the floor. Carpenter fell too, but he maintained his hold on the controls and tore at them desperately to check us.

I scrambled to my feet and watched. The red wall was alarmingly close. Nearer we drove and then came another jerk which threw me sprawling again. The wall retreated. In another moment we were standing still, with the red all around us at a distance of about two hundred yards.

"We had a narrow escape from being cremated," said Carpenter with a shaky laugh. "I knew that our speed would increase as soon as we got clear of the layer but it caught me by surprise just the same. I had no idea how great the holding effect of the stuff was. Well, First Mortgage, the road to space is open for us. May I invite you to be my guest on a little week-end jaunt to the Moon?"

"No thanks, Jim," I said with a wry smile. "I think a little trip to the edge of the layer will quite satisfy me."

"Quitter," he laughed. "Well, say good-bye to familiar things. Here we go!"

He turned to the controls of the flyer, and presently

we were moving again, this time directly away from the earth. There was no jerk at starting this time, merely a feeling as though the floor were pressing against my feet, a great deal like the feeling a person gets when they rise rapidly in an express elevator. The indicator showed that we were traveling only sixty miles an hour. For half an hour we continued monotonously on our way with nothing to divert us. Carpenter yawned.

"Now that it's all over, I feel let down and sleepy," he announced. "We are well beyond the point to which Hadley penetrated and so far we have met with no resistance. We are probably nearly at the outer edge of the layer. I think I'll shoot up a few miles more and then call it a day and go home. We are about eighty miles from the earth now."

I looked down, but could see nothing below us but the dense cloud of black soot resulting from the destruction of the heaviside layer. Like Carpenter, I felt sleepy, and I suppressed a yawn as I turned again to the window.

"Look here, Jim!" I cried suddenly. "What's that?"

He moved in a leisurely manner to my side and looked out. As he did so I felt his hand tighten on my shoulder with a desperate grip. Down the wall of red which surrounded us was coming an object of some kind. The thing was fully seventy-five yards long and half as wide at its main portion, while long irregular streams extended for a hundred yards on each side of it. There seemed to be dozens of them.

"What is it, Jim?" I asked in a voice which sounded high and unnatural to me.

"I don't know," he muttered, half to me and half to himself. "Good Lord, there's another of them!"

He pointed. Not far from the first of the things came another, even larger than the first. They were moving sluggishly along the red light, seeming to flow rather than to crawl. I had a horrible feeling that they were alive and malignant.

[Image description start: A black and white illustration showing narrow wedge shaped flyer moving through a lighter column in the heavisider layer, represented outside the colum by dark static, with massive, flat creautues with tentacles all around them, and fourgiant eyes in their front, two of them looking at the ship. Image description end.]

Carpenter stepped back to the controls of the flyer and stopped our movement; we hung in space,

watching them. The things were almost level with us, but their sluggish movement was downward toward the earth. In color, they were a brilliant crimson, deepening into purple near the center. Just as the first of them came opposite us it paused, and slowly a portion of the mass extended itself from the main bulk; and then, like doors opening, four huge eyes, each of them twenty feet in diameter, opened and stared at us.

"It's alive, Jim," I quavered. I hardly knew my own voice as I spoke.

Jim stepped back to the controls with a white face, and slowly we moved closer to the mass. As we approached I thought that I could detect a fleeting passage of expression in those huge eyes. Then they disappeared and only a huge crimson and purple blob lay before us. Jim moved the controls again and the flyer came to a stop.

Two long streamers moved out from the mass. Suddenly there was a jerk to the ship which threw us both to the floor. It started upward at express train

speed. Jim staggered to his feet, grasped the controls and started all four bow motors at full capacity, but even this enormous force had not the slightest effect in diminishing our speed.

"Well, the thing's got us, whatever it is," said Jim as he pulled his controls to neutral, shutting off all power. Now that the danger had assumed a tangible form, he appeared as cool and collected as ever, to my surprise, I found that I had recovered control of my muscle and of my voice. I became aware that the shoulder which Jim had gripped was aching badly, and I rubbed it absently.

"What is it, Jim?" I asked for the third time.

"I don't know," he replied. "It is some horrible inhabitant of space, something unknown to us on earth. From its appearance and actions, I think it must be a huge single-celled animal of the type of the earthly amoeba. If an amoeba is that large here, what must an elephant look like? However, I expect that we'll learn more about the matter later because it's taking us with it, wherever it's going."

uddenly the flyer became dark inside. I looked at the nearest window, but I could not even detect its outline. I reached for the light switch, but a sudden change in direction threw me against the wall. There was an instant of intense heat in the flyer.

"We have passed the heaviside layer," said Jim. "The brute has changed direction, and we felt that heat when he took us through the infra-red wall."

I reached again for the light switch, but before I could find it our motion ceased and an instant later the flyer was filled with glaring sunlight. We both turned to the window.

We lay on a glistening plain of bluish hue which stretched without a break as far as we could see. Not a thing broke the monotony of our vision. We turned to the opposite window. How can I describe the sight which met our horrified gaze? On the plain before us lay a huge purple monstrosity of gargantuan dimensions. The thing was a shapeless mass, only the four huge eyes standing out regarding us balefully. The mass was continually changing its outline and, as

we watched, a long streamer extended itself from the body toward us. Over and around the flyer the feeler went, while green and red colors played over first one and then another of the huge eyes before us. The feeler wrapped itself around the flyer and we were lifted into the air toward those horrible eyes. We had almost reached them when the thing dropped us. We fell to the plain with a crash. We staggered to our feet again and looked out. Our captor was battling for its life.

ts attacker was a smaller thing of a brilliant green hue, striped and mottled with blue and yellow. While our captor was almost formless, the newcomer had a very definite shape. It resembled a cross between a bird and a lizard, its shape resembling a bird, as did tiny rudimentary wings and a long beak, while the scaly covering and the fact that it had four legs instead of two bore out the idea that it might be a lizard. Its huge birdlike beak was armed with three rows of long sharp teeth with which it was tearing at our captor. The purple amoeba was holding its assailant with a dozen of its thrown out feelers which

were wrapped about the body and legs of the green horror. The whole battle was conducted in absolute silence.

"Now's our chance, Jim!" I cried. "Get away from here while that dragon has the amoeba busy!"

He jumped to the control levers of the flyer and pulled the starting switch well forward. The shock of the sudden start hurled me to the floor, but from where I fell I was able to watch the battle on the plain below us. It raged with uninterrupted fury and I felt certain of our escape when, with a shock which hurled both Jim and me to the ceiling, the flyer stopped. We fell back to the floor and I reflected that it was well for us that the interior of the flyer was so well padded. Had it not been, our bones would have been broken a dozen times by the shocks to which we had been subjected.

"What now?" I asked as I painfully struggled to my feet.

"Another of those purple amoebas," replied Jim from

the vantage point of a window. "He's looking us over as if he were trying to decide whether we are edible or not."

joined him at the window. The thing which had us was a replica of the monster we had left below us engaged in battle with the green dragon which had attacked it. The same indefinite and ever changing outline was evident, as well as the four huge eyes. The thing regarded us for a moment and slowly moved us up against its bulk until we touched it. Deeper and deeper into the mass of the body we penetrated until we were in a deep cavern with the light coming to us only from the entrance. I watched the entrance and horror possessed my soul.

"The hole's closing. Jim!" I gasped. "The thing is swallowing us!"

"I expected that," he replied grimly. "The amoeba has no mouth, you know. Nourishment is passed into the body through the skin, which closes behind it. We are a modern version of Jonah and the whale, First Mortgage."

"Well, Jonah got out," I ventured.

"We'll try to," he replied. "When that critter swallowed us, he got something that will prove pretty indigestible. Let's try to give him a stomach ache. I don't suppose that a machine-gun will affect him, but we'll try it."

"I didn't know that you had any guns on board."

"Oh yes, I've got two machine-guns. We'll turn one of them loose, but I don't expect much effect from it."

He moved over to one of the guns and threw off the cover which had hidden it from my gaze. He fed in a belt of ammunition and pulled his trigger. For half a minute he held it down, and two hundred and fifty caliber thirty bullets tore their way into space. There was no evidence of movement on the part of our host.

"Just as I thought," remarked Jim as he threw aside the empty belt and covered the gun again. "The thing has no nervous organization to speak of and probably never felt that. We'll have to rig up a disintegrating

ray for him."

"What?" I gasped.

"A disintegrating ray," he replied. "Oh yes, I know how to make the fabulous 'death ray' that you journalists are always raving about. I have never announced my discovery, for war is horrible enough without it, but I have generated it and used it in my work a number of times. Did it never occur to you that the rocket motor is built on a disintegrating ray principle?"

"Of course it is, Jim. I never thought of it in that light before, but it must be. How can you use it? The discharge from the motors is a harmless stream of energy particles."

"Instead of turning the ray into powdered aluminum and breaking it down, what is to prevent me from turning it against the body of our captor and blasting my way out?"

"I don't know."

"Well, nothing is. I'll have to modify one of the motors a little, but it's not a hard job. Get some wrenches from the tool box and we'll start."

An hour of hard work enabled us to disconnect one of the reserve bow motors and, after the modifications Jim had mentioned, turn the ray out through the port through which the products of disintegration were meant to go. When we had bolted it in place with an improvised coupling, Jim opened the vitriolene screen which held in our air and turned to his control board.

"Here goes," he said.

He pulled the lever to full power and with a roar which almost deafened us in the small flyer, the ray leaped out to do its deadly work. I watched through a port beside the motor. There was a flash of intense light for an instant and then the motor died away in silence. A path to freedom lay open before us. Jim started one of the stern motors and slowly we forced our way through the hole torn in the living mass. When we were almost at the surface, he threw in full power and we shot free from the amoeba and into the

open. Again we were stopped in midair and drawn back toward the huge bulk. The eyes looked at us and we were turned around. As the ray swung into a position to point directly toward one of the eyes, Jim pulled the controlling lever. With the flash of light which ensued, the eye and a portion of the surrounding tissue disappeared. The amoeba writhed and changed shape rapidly, while flashes of brilliant crimson played over the remaining eyes. Again the ray was brought into play and another of the eyes disappeared. This was evidently enough for our captor, for it suddenly released us and instantly we started to fall. Jim caught the control levers and turned on our power in time to halt us only a few feet above the plain toward which we were falling. We were close to the point whence we had started up and we could see that the battle below us was still raging.

The green dragon was partially engulfed by the amoeba, but it still relentlessly tore off huge chunks and devoured them. The amoeba was greatly reduced in bulk but it still fought gamely. Even as we approached the dragon was evidently satiated, for it

slowly withdrew from the purple bulk and back away. Long feelers shot out from the amoeba's bulk toward the dragon but they were bitten off before they could grasp their prey.

"Let's get away from here, Jim," I cried, but I spoke too late. Even as the words left my mouth the green dragon saw us and raised itself in the air, and with gaping jaws launched itself at us. It took Jim only a moment to shoot the flyer up into space, and the charge passed harmlessly beneath us. The dragon checked its headway and turned again toward us.

"Use the machine-gun, Pete!" cried Jim. "I've got to run the ship."

I threw the cover off the gun and fed in a fresh belt of ammunition. As the green monster dashed toward us I hastily aligned the gun and pulled the trigger. My aim was good and at least fifty of the bullets plowed through the approaching bulk before Jim dropped the ship and allowed it to pass above us. Again the dragon turned and charged, and again I met it with a hail of bullets. They had no apparent effect and Jim

dropped the ship again and let the huge bulk shoot by above us. Twice more the dragon rushed but the last rush was less violent than had been the first three.

"The bullets are affecting him, Pete!" cried Jim as he shot the flyer upward. "Give him another dose!"

I hastily fed in another belt, but it was not needed. The dragon rushed the fifth time, but before it reached us its velocity fell off and it passed harmlessly below us and fell on a long curve to the plain below. It fell near the purple amoeba which it had battled and a long feeler shot out and grasped it. Straight into the purple mass it was drawn, and vanished into the huge bulk.

Jim started one of the stern motors. In a few seconds we were far from the scene.

"Have you any idea of which direction to go?" he asked. I shook my head.

"Have you a radio beacon?" I asked.

He withered me with a glance.

"We're beyond the heaviside layer," he reminded me.

For a moment I was stunned.

"We can't be very far from the hole," he said consolingly as he fumbled with the controls. "But before we try to find it, we had better disconnect one of the stern motors and rig it as a disintegrating ray so that we will have one bearing in each direction. We may meet more denizens of space who like our looks, and we haven't much ammunition left."

We landed on the plain and in an hour had a second disintegrating ray ready for action. Thus armed, we rose from the blue plain and started at random on our way. For ten minutes we went forward. Then Jim stopped the flyer and turned back. We had gone only a short distance when I called to him to stop.

"What is it?" he demanded as he brought the flyer to a standstill.

"There's another creature ahead of us," I replied. "A red one."

"Red?" he asked excitedly as he joined me. About a mile ahead of us a huge mass hung in the air. It resembled the amoeba which had attacked us, except that the newcomer was red. As we watched, it moved toward us. As it did so its color changed to purple.

"Hurrah!" cried Jim. "Don't you remember, Pete, that the one which captured us and took us out of the hole was red while in the hole and then turned purple? That thing just came out of the hole!"

"Then why can't we see the red beam?" I demanded.

"Because there's no air or anything to reflect it," he replied. "We can't see it until we are right in it."

I devoutly hoped that he was right as he headed the ship toward the waiting monster. As we approached the amoeba came rapidly to meet us and a long feeler shot out. As it did so there was a flash of intense light ahead of us as Jim turned loose the ray, and the feeler

disappeared. Another and another met the same fate. Then Jim rotated the ship slightly and let out the full force of the ray toward the monster. A huge hole was torn in it, and as we approached with our ray blazing, the amoeba slowly retreated and our path was open before us. Again there was an instant of intense heat as we passed through the red wall, and we were again in the hole which Jim's lamps had blasted through the layer. Below us still lay the fog which had obscured the earth when we had started on our upward trip.

Down toward the distant earth we dropped. We had gone about thirty miles before we saw on the side of the hole one of the huge amoeba which were so thick above.

"We might stop and pick that fellow off," said Jim, "but, on the whole, I think we'll experiment with him."

He drove the ship nearer and turned it on its axis, holding it in position by one of the auxiliary discharges. A flash came from our forward ray and a portion of the amoeba disappeared. A long arm moved out toward us, but it moved slowly and sluggishly

instead of with the lightninglike swiftness which had characterized the movements of the others. Jimmy easily eluded it and dropped the ship a few yards. The creature pursued it, but it moved slowly. For a mile we kept our distance ahead of it, but we had to constantly decrease our speed to keep from leaving it behind. Soon we were almost at a standstill, and Jim reversed our direction and drew nearer. A feeler came slowly and feebly out a few feet toward us and then stopped. We dropped the ship a few feet but the amoeba did not follow. Jim glanced at the altimeter.

"Just as I thought," he exclaimed. "We are about forty-five miles above the earth and already the air is so dense that the thing cannot move lower. They are fashioned for existence in the regions of space and in even the most rarified air they are helpless. There is no chance of one ever reaching the surface of the earth without years of gradual acclimation, and even if it did, it would be practically immobile. In a few years the layer will flow enough to plug the hole I have made, but even so, I'll build a couple of space flyers equipped with disintegrating rays as soon as we

get down and station them alongside the hole to wipe out any of that space vermin which tries to come through. Let's go home. We've put in a good day's work."

Hundreds of the purple amoeba have been destroyed by the guarding ships during the past five years. The hole is filling in as Jim predicted, and in another ten years the earth will be as securely walled in as it ever was. But in the mean time, no one knows what unrevealed horrors space holds, and the world will never rest entirely easy until the slow process of time again heals the broken protective layer.

#34 The Attack From Space, By Sterner St. Paul Meek:

From a far world came monstrous invaders who were all the more terrifying because invisible.

"No one knows what unrevealed horrors space holds and the world will never rest entirely easy until the slow process of time again heals the protective layer."—From "Beyond the Heaviside Layer."

Over a year has passed since I wrote those lines. When they were written the hole which Jim Carpenter had burned with his battery of infra-red lamps through the heaviside layer, that hollow sphere of invisible semi-plastic organic matter which encloses

the world as a nutshell does a kernel, was gradually filling in as he had predicted it would: every one thought that in another ten years the world would be safely enclosed again in its protective layer as it had been since the dawn of time. There were some adventurous spirits who deplored this fact, as it would effectually bar interplanetary travel, for Hadley had proved with his life that no space flyer could force its way through the fifty miles of almost solid material which barred the road to space, but they were in the minority. Most of humanity felt that it would rather be protected against the denizens of space than to have a road open for them to travel to the moon if they felt inclined.

From a far world came monstrous invaders who were all the more terrifying because invisible.

To be sure, during the five years that the hole had been open, nothing more dangerous to the peace and well-being of the world had appeared from space than a few hundreds of the purple amoeba which we had found so numerous on the outer side of the layer, when we had traveled in a Hadley space ship up

through the hole into the outer realms of space, and one lone specimen of the green dragons which we had also encountered. The amoeba had been readily destroyed by the disintegrating rays of the guarding space-ships which were stationed inside the layer at the edge of the hole and the lone dragon had fallen a ready victim to the machine-gun bullets which had been poured into it. At first the press had damned Jim Carpenter for opening the road for these horrors, but once their harmlessness had been clearly established, the row had died down and the appearance of an amoeba did not merit over a squib on the inside pages of the daily papers.

While the hole in the heaviside layer was no longer news for the daily press, a bitter controversy still waged in the scientific journals as to the reason why no observer on earth, even when using the most powerful telescopes, could see the amoeba before they entered the hole, and then only when their telescopes were set up directly under the hole. When a telescope of even small power was mounted in the grounds back of Carpenter's laboratory, the amoeba

could be detected as soon as they entered the hole, or when they passed above it through space; but, aside from that point of vantage, they were entirely invisible.

Carpenter's theory of the absorptive powers of the material of which the heaviside layer was composed was laughed to scorn by most scientists, who pointed out the fact that the sun, moon and stars could be readily seen through it. Carpenter replied that the rays of colored or visible light could only pass through the layer when superimposed upon a carrier wave of ultra-violet or invisible light. He stated dogmatically that the amoeba and the other denizens of space absorbed all the ultra-violet light which fell on them and reflected only the visible rays which could not pass through the heaviside layer because of the lack of a synchronized carrier wave of shorter wavelength.

Despetier replied at great length and showed by apparently unimpeachable mathematics that Carpenter was entirely wrong and that his statements showed an absolute lack of knowledge of the most

elementary and fundamental laws of light transmission. Carpenter replied briefly that he could prove by mathematics that two was equal to one and he challenged Despetier or anyone else to satisfactorily explain the observed facts in any other way. While they vainly tried to do so, Carpenter lapsed into silence in his Los Angeles laboratory and delved ever deeper into the problems of science. Such was the situation when the attack came from space.

My first knowledge of the attack came when McQuarrie, the city editor of the San Francisco *Clarion*, sent for me. When I entered his office he tossed a Los Angeles dispatch on the desk before me and with a growl ordered me to read it. It told of the unexplained disappearance of an eleven year old boy the night before. It looked like a common kidnapping.

"Well?" I asked as I handed him back the dispatch.

With another growl he tossed down a second telegram. I read it with astonishment, for it told of a second disappearance which had happened about an hour after the first. The similarity of the two cases

was at once apparent.

"Coincidence or connection?" I asked as I returned it.

"Find out!" he replied. "If I knew which it was I wouldn't be wasting the paper's money by sending you to Los Angeles. I don't doubt that I am wasting it anyway, but as long as I am forced to keep you on as a reporter, I might as well try to make you earn the money the owner wastes on paying you a salary, even although I know it to be a hopeless task. Go on down there and see what you can find out, if anything."

I jotted down in my notebook the names and addresses of the missing children and turned to leave. A boy entered and handed McQuarrie a yellow slip. He glanced at it and called me back.

"Wait a minute, Bond," he said as he handed me the dispatch. "I doubt but you'd better fly down to Los Angeles. Another case has just been reported."

I hastily copied down the dispatch he handed me, which was almost a duplicate of the first two with the

exception of the time and the name. Three unexplained disappearances in one day was enough to warrant speed; I drew some expense money and was on my way south in a chartered plane within an hour.

On my arrival I went to the Associated Press office and found a message waiting for me, directing me to call McQuarrie on the telephone at once.

"Hello, Bond," came his voice over the wire, "have you just arrived? Well, forget all about that disappearance case. Prince is on his way to Los Angeles to cover it. You hadn't been gone an hour before a wire came in from Jim Carpenter. He says, 'Send Bond to me at once by fastest conveyance. Chance for a scoop on the biggest story of the century.' I don't know what it's about, but Jim Carpenter is always front page news. Get in touch with him at once and stay with him until you have the story. Don't risk trying to telegraph it when you get it—telephone. Get moving!"

I lost no time in getting Carpenter on the wire.

"Hello, First Mortgage," he greeted me. "You made

good time getting down here. Where are you?"

"At the A. P. Office."

"Grab a taxi and come out to the laboratory. Bring your grip with you: you may have to stay over night."

"I'll be right out, Jim. What's the story?"

His voice suddenly grew grave.

"It's the biggest thing you ever handled," he replied.

"The fate of the whole world may hang on it. I don't want to talk over the phone; come on out and I'll give you the whole thing."

An hour later I shook hands with Tim, the guard at the gate of the Carpenter laboratory, and passed through the grounds to enter Jim's private office. He greeted me warmly and for a few minutes we chatted of old times when I worked with him as an assistant in his atomic disintegration laboratory and of the stirring events we had passed through together when we had ventured outside the heaviside layer in his

space ship.

"Those were stirring times," he said, "but I have an idea, First Mortgage, that they were merely a Sunday school picnic compared to what we are about to tackle."

"I guessed that you had something pretty big up your sleeve from your message." I replied. "What's up now? Are we going to make a trip to the moon and interview the inhabitants?"

"We may interview them without going that far," he said. "Have you seen a morning paper?"

"No."

"Look at this."

He handed me a copy of the *Gazette*. Streamer headlines told of the three disappearances which I had come to Los Angeles to cover, but they had grown to five during the time I had been flying down. I looked at Jim in surprise.

"We got word of that in San Francisco," I told him, "and I came down here to cover the story. When I got here, McQuarrie telephoned me your message and told me to come and see you instead. Has your message anything to do with this?"

"It has everything to do with it, First Mortgage; in fact, it *is* it. Have you any preconceived ideas on the disappearance epidemic?"

"None at all."

"All the better—you'll be able to approach the matter with an unbiased viewpoint. Don't read that hooey put out by an inspired reporter who blames the laxness of the city government; I'll give you the facts without embellishment. Nothing beyond the bare fact of the disappearance is known about the first case. Robert Prosser, aged eleven, was sent to the grocery store by his mother about six-thirty last night and failed to return. That's all we know about it, except that it happened in Eagle Rock. The second case we have a little more data on. William Hill, aged twelve, was playing in Glendale last night with some companions.

They were playing 'hide and go seek' and William hid. He could not be found by the boy who was searching and has not been found since. His companions became frightened and reported it about eight o'clock. They saw nothing, but mark this! Four of them agree that they heard a sound in the air *like a motor humming*."

"That proves nothing."

"Taken alone it does not, but in view of the third case, it is quite significant. The third case happened about nine-thirty last night. This time the victim was a girl, aged ten. She was returning home from a moving picture with some companions and she disappeared. This time the other children saw her go. They say she was suddenly taken straight up into the air and then disappeared from sight. They, also claim to have heard a sound like a big electric fan in the air at the time, although they could see nothing."

"Had they heard the details of the second disappearance?"

"They had not. I can see what you are thinking; that they were unconsciously influenced by the account given of the other case."

"Consciously or unconsciously."

"I doubt it, for the fourth case was almost a duplicate of the third. The fourth and fifth cases happened this morning. In the fourth case the child, for it was a nine year old girl this time, was lifted into the air in broad daylight and disappeared. This disappearance was witnessed, not only by children, but also by two adults, and their testimony agrees completely with that of the children. The fifth case is similar to the first: a ten year old boy disappeared without trace. The whole city is in a reign of terror."

The telephone at Carpenter's elbow rang and he answered it. A short conversation took place and he turned to me with a grim face as he hung up the receiver.

"Another case has just been reported to police headquarters from Beverly Hills," he said. "Again the

child was seen to be lifted into the air by some invisible means and disappeared. The sound of a motor was plainly heard by five witnesses, who all agree that it was just, above their heads, but that nothing could be seen."

"Was it in broad daylight?"

"Less than an hour ago."

"But, Jim, that's impossible!"

"Why is it impossible?"

"It would imply the invisibility of a tangible substance; of a solid."

"What of it?"

"Why, there isn't any such substance. Nothing of the sort exists."

Carpenter pointed to one of the windows of his laboratory.

"Does that window frame contain glass or not?" he asked.

I strained my eyes. Certainly nothing was visible.

"Yes," I said at a venture.

He rose and thrust his hand through the space where the glass should have been.

"Has this frame glass in it?" he asked, pointing to another.

"No."

He struck the glass with his knuckle.

"I'll give up," I replied. "I am used to thinking of glass as being transparent but not invisible; yet I can see that under certain light conditions it may be invisible. Granted that such is the case, do you believe that living organisms can be invisible?"

"Under the right conditions, yes. Has any observer

been able to see any of the purple amoeba which we know are so numerous on the outer side of the heaviside layer?"

"Not until they have entered the hole through the layer."

"And yet those amoeba are both solid and opaque, as you know. Why is it not possible that men, or intelligences of some sort, are in the air about us and yet are invisible to our eyes!"

"If they are, why haven't we received evidence of it years ago?"

"Because there has only been a hole through the heaviside layer for six years. Before that time they could not penetrate it any more than poor Hadley could with his space ship. They have not entered the hole earlier because it is a very small one, at present only some two hundred and fifty yards in diameter in a sphere of over eight thousand miles diameter. The invaders have just found the entrance."

"The invaders? Do you think that the world has been invaded?"

"I do. How else can you explain the very fact which you have just quoted, that no evidence of the presence on these invisible entities has previously been recorded?"

"Where did they come from?"

"They may have come from any where in the solar system, or even from outside it but I fancy, that they are from Mars or Venus."

"Why so?"

"Because they are the two planets nearest to the earth and are the ones where conditions are the most like they are on the earth. Venus, for example, has an atmosphere and a gravity about .83 of earthly gravity, and life of a sort similar to that of the earth might well live there. Further, it seems more probable that the invaders have come from one of the nearby planets than from the realms of space beyond the

solar system."

"What about the moon?"

"We can dismiss that because of the lack of an atmosphere."

"It sounds logical, Jim, but the idea of living organisms of sufficient size to lift a child into the air who are invisible seems a little absurd."

"I never said they were invisible. I don't think they are."

"But they must be, else why weren't they seen?"

"Use your head, First Mortgage. Those purple amoeba we encountered were quite visible to us, yet they are invisible to observers on the earth."

"Yes, but that is because the heaviside layer is between them and the earth. As soon as they come below it they can be seen."

"Exactly. Why is it not possible that the Venetians, or Martians, or whoever our invaders are, have encased themselves and their space flyer in a layer of some substance similar to the heaviside layer, a substance which is permeable to light rays only when a large proportion of ultra-violet rays accompany the visible rays? If they did this and then constructed the walls of their ship of some substance which absorbed all the ultra-violet rays which fell on it; not only would the ship itself be invisible, but also everything contained in it—and yet they could see the outside world easily. That such *is* the case is proved by the disappearance of those children in mid-air. They were taken into a space ship behind an ultra-violet absorbing wall and so became invisible."

"If the walls absorbed all the ultra-violet and were impermeable to light without ultra-violet, the ship would appear as a black opaque substance and could be seen."

"That would be true except for one thing which you are forgetting. The heaviside layer, as I have repeatedly proved, is a splendid conductor of ultra-

violet. The rays falling on it are probably bent along the line of the covering layer so that they open up and bend around the ship in the same manner as flowing water will open up and flow around a stone and then come together again. The light must flow around the solid ship and then join again in such a manner that the eye can detect no interruption."

"Jim, all that sounds reasonable, but have you any proof of it?"

"No, First Mortgage, I haven't—yet; but if the Lord is good to us we'll have definite proof this afternoon and be in a position to successfully combat this new menace to the world."

"Do you expect me to go on another one of your crack-brained expeditions into the unknown with you?"

"Certainly I do, but this time we won't go out of the known. I have our old space flyer which we took beyond the heaviside layer six years ago ready for action and we're going to look for the invaders this

afternoon."

"How will we see them if they are invisible?"

"They are invisible to ordinary light but not to ultra-violet light. While most of the ultra-violet is deflected and flows around the ship or else is absorbed, I have an idea that, if we bathe it in a sufficient concentration of ultra-violet, some would be reflected. We are going to look for the reflected portion."

"Ultra-violet light is invisible."

"It is to the eye, but it can be detected. You know that radium is activated and glows under ultra-violet?"

"Yes."

"Mounted on our flyer are six ultra-violet searchlights. By the side of each one is a wide angle telescopic concentrator which will focus any reflected ultra-violet onto a radium coated screen and thus make it visible to us. In effect the apparatus is a camera obscura with all lens made of rock crystal or fused

quartz, both of which allow free passage to ultra-violet."

"What will we do if we find them?"

"Mounted beneath the telescope is a one-pounder gun with radite shells. If we locate them, we will use our best efforts to shoot them down."

"Suppose they are armed too?"

"In that case I hope that you shoot faster and straighter than they do. If you don't—well, old man, it'll just be too damned bad."

"I don't know that the *Clarion* hires me to go out and shoot at invisible invaders from another planet, but if I don't go with you, I expect you'd just about call up the *Echo* or the *Gazette* and ask them for a gunner."

"Just about."

"In that case, I may as well be sacrificed as anyone else. When do we start?"

"You old faker!" cried Jim, pounding me on the back. "You wouldn't miss the trip for anything. If you're ready we'll start right now. Everything is ready."

"Including the sacrifice," I replied, rising. "All right, Jim, let's go and get it over with. If we live, I'll have to get back in time to telephone the story to McQuarrie for the first edition."

I followed Jim out of the laboratory and to a large open space behind the main building where the infra-red generators with which he had pierced the hole through the heaviside layer had been located. The reflectors were still in place, but the bank of generators had been removed. A gang of men were hard at work erecting a huge parabolic reflector in the center of the circle, about the periphery of which the infra-red reflectors were placed. In an open space near the center stood a Hadley space ship, toward which Jim led the way.

I wondered at the activity and meant to ask what it portended, but in the excitement of boarding the flyer forgot it. I followed Jim in; he closed the door and

started the air conditioner.

"Here, First Mortgage," he said as he turned from the control board and faced me, "here are the fluoroscopic screens. They are arranged in a bank, so that you can keep an eye on all of them readily.

Beneath each telescope is an automatic one-pounder gun with its mount geared to the telescope and the light, so that the gun bears continually on the point in space represented by the center of the fluoroscopic screen which belongs to that light. If we locate anything, turn your beam until the object is in the exact center of the screen where these two cross-hairs are. When you have it lined up, push this button and the gun will fire."

"What about reloading?"

"The guns are self-loading. Each one has twenty shells in its magazine and will fire one shot each time the button is pushed until it is empty. If you empty one magazine, I can turn the ship so that another gun will bear. This gives you a total of one hundred and twenty shots quickly available; there are sixty extra rounds,

which we can break out and load into the magazines in a few seconds. Do you understand everything?"

"I guess so. Everything seems clear enough."

"All right; sit down and we'll start."

I took my seat, and Jim pulled the starting lever. I was glued to the seat and the heavy springs in the cushion were compressed almost to their limit by the sudden acceleration. As soon as we were well clear of the ground Jim reduced his power, and in a few moments we were floating motionless in the air, a thousand feet up. He left the control board and came to my side.

"Start your ultra lights," he said as he joined me. "We may be able to spot something from here."

I started the lights and we stared at the screens before us. Nothing appeared on any of them except the one pointing directly down, and only an image of the ground, appeared on it. Under Jim's tutelage I swung the beams in wide circles, covering the space around us, but nothing appeared.

"Those beams won't project over five miles in this atmosphere," he said, "and the ship we are looking for may be so small that we would have trouble locating it at any great distance. I am going to move over near the scene of the last disappearance. Keep your lights swinging and sing out if you see anything on the screens."

I could feel the ship start to move slowly under the force of a side discharge from the rocket motor, and I swung the beams of the six lights around, trying to cover the entire area about us. Nothing appeared on the screens for an hour, and my head began to ache from the strain of unremitting close observation of the glowing screens. A buzz sounding over the hum of the rocket motor attracted my attention; Jim pulled his levers to neutral with the exception of the one which maintained our elevation and stepped to an instrument on the wall of the flyer.

"Hello," he called. "What? Where did it happen? All right, thanks, we'll move over that way at once."

He turned from the radio telephone and spoke.

"Another disappearance has just been reported," he said. "It happened on the outskirts of Pasadena. Keep your eyes open: I'm going to head in that direction."

A few minutes later we were floating over Pasadena. Jim stopped the flyer and joined me at the screens. We swung our beams in wide circles to cover the entire area around us, but no image on the screens rewarded us.

"Doggone it, they must have left here in a hurry," grumbled Jim.

Even as he spoke the flyer gave a lurch which nearly threw me off my seat and which sent Jim sprawling on the floor. With a white face he leaped to the control board and pulled the lever controlling our one working stern motor to full power. For a moment the ship moved upward and then came to a dead stop, although the motor still roared at full speed.

"Can't you see anything, Pete?" cried Jim as he threw our second stern motor into gear.

Again the ship moved upward for a few feet and then stopped. I swung the searchlights frantically in all directions, but five of the screens remained blank and the sixth showed only the ground below us.

"Not a thing," I replied.

"Something ought to show," he muttered, and suddenly shut off both motors. The flyer gave a sickening lurch toward the ground, but we fell only a hundred yards before our motion stopped. We hung suspended in the air with no motors working. Jim joined me at the screens and we swung the lights rapidly without success.

"Look, Pete!" Jim cried hoarsely.

My gaze followed his pointing finger and I saw the door of our flyer springing out as though some force from the outside were trying to wrench it open. The pull ceased for an instant, then came again; the sturdy latches burst and the door was torn from its hinges. Jim swung one of the searchlights until the beam was at right angles to the hull of the flyer and

pressed the gun button. A crash filled the confined space of the flyer as a one-pounder radite shell tore out into space.

"They're there but still invisible," he exclaimed as he shifted the direction of the gun and fired again. "I am shooting by guess-work, but I might score a hit."

He changed the direction of the gun again, but before he could press the button he was lifted into the air and drawn rapidly toward the open door.

"Shoot, Pete!" he shouted. "Shoot and keep on shooting—it's your only chance!"

I turned to the knobs controlling the guns and lights, but, before I could make a move, something hard and cold grasped me about the middle and I was lifted into the air and drawn toward the open door after Jim. I tore at the thing holding me with my hands, but it was a smooth round thing like a two-inch thick wire, and I could get no grip on it to loosen it. Out through the door I went and was drawn through the air a few feet behind Jim. He moved ahead of me for

fifteen or twenty feet and then vanished in mid-air. I dared not struggle in mid-air and I was drawn through a door into a large space flyer which became visible as I entered it. The flexible wire or rod which had held me uncoiled and I was free on the floor beside Jim Carpenter. This much was clear and understandable, but when I looked at the crew of that space ship, I was sure that I had lost my mind or was seeing visions. I had naturally expected men, or at least something in semi-human form, but instead of anything of the sort, before me stood a dozen gigantic beetles!

I rubbed my eyes and looked again. There was no mistaking the fact that we had been captured by a race of gigantic beetles flying an invisible space ship. When I had time later to examine them critically, I could see marked differences between our captors and the beetles we were accustomed to see on the earth besides the mere matter of size. To begin with, their bodies were relatively much smaller, the length of shell of the largest specimen not being over four feet, while the head of the same insect, exclusive of

the horns or pinchers, was a good eighteen inches in length. The pinchers, which by all beetle proportions should have been a couple of feet long at the least, did not extend over the head a distance greater than eight inches, although they were sturdy and powerful.

Instead of traveling with their shells horizontal as do earthly beetles, these insects stood erect on their two lower pairs of legs, which were of different lengths so that all four feet touched the ground when the shell was vertical. The two upper pairs of legs were used as arms, the topmost pair being quite short and splitting out at the end into four flexible claws about five inches long, which they used as fingers. These upper arms, which sprouted from a point near the top of the head, were peculiar in that they apparently had no joints like the other three pairs but were flexible like an elephant's trunk. The second pair of arms were armed with long, vicious-looking hooks. The backplates concealed only very rudimentary wings, not large enough to enable the insects to fly, although Jim told me later that they could fly on their own planet, where the lessened gravity made such

extensive wing supports as would be needed on earth unnecessary.

The backplates were a brilliant green in color, with six-inch stripes of chrome yellow running lengthwise and crimson spots three inches in diameter arranged in rows between the stripes. Their huge-faceted eyes sparkled like crystal when the light fell on them, and from time to time waves of various colors passed over them, evidently reflecting the insect's emotions. Although they gave the impression of great muscular power, their movements were slow and sluggish, and they seemed to have difficulty in getting around.

(Editor's note 1:

Mr. Bond has made a laughable error in his description. Like all of the coleoptera, the Mercurians were hexapoda (six legged). What Mr. Bond continually refers to in his narrative as "upper arms" were really the antenna of the insects which split at the end into four flexible appendages resembling fingers. His mistake is a natural one, for the Mercurians used their antenna as extra arms.—James

S. Carpenter. End Editor's note.]

As my horrified gaze took in these monstrosities I turned with a shudder to Jim Carpenter.

"Am I crazy, Jim," I asked, "or do you see these things too?"

"I see them all right, Pete," he replied. "It isn't as surprising as it seems at first glance. You expected to find human beings; so did I, but what reason had we for doing so? It is highly improbable, when you come to consider the matter, that evolution should take the same course elsewhere as it did on earth. Why not beetles, or fish, or horned toads, for that matter?"

"No reason, I guess," I answered; "I just hadn't expected anything of the sort. What do you suppose they mean to do with us?"

"I haven't any idea, old man. We'll just have to wait and see. I'll try to talk to them, although I don't expect much luck at it."

He turned to the nearest beetle and slowly and clearly spoke a few words. The insect gave no signs of

comprehension, although it watched the movement of Jim's lips carefully. It is my opinion, and Jim agrees with me, that the insects were both deaf and dumb, for during the entire time we were associated with them, we never heard them give forth a sound under any circumstances, nor saw them react to any sound that we made. Either they had some telepathic means of communication or else they made and heard sounds beyond the range of the human ear, for it was evident from their actions that they frequently communicated with one another.

When Jim failed in his first attempt to communicate he looked around for another method. He noticed my notebook, which had fallen on the floor when I was set down; he picked it up and drew a pencil from his pocket. The insects watched his movements carefully, and when he had made a sketch in the book, the nearest one took it from him and examined it carefully and then passed it to another one, who also examined it. The sketch which Jim had drawn showed the outline of the Hadley space flyer from which he had been taken. When the beetles had examined the

sketch, one of them stepped to an instrument board in the center of the ship and made an adjustment. Then he pointed with one of his lower arms.

We looked in the direction in which he pointed; to our astonishment, the walls of the flyer seemed to dissolve, or at least to become perfectly transparent. The floor of the space ship was composed of some silvery metal, and from it had risen walls of the same material, but now the effect was as though we were suspended in mid-air, with nothing either around us or under us. I gasped and grabbed at the instrument board for support. Then I felt foolish as I realized that there was no change in the feel of the floor for all its transparency and that we were not falling.

A short distance away we could see our flyer suspended in the air, held up by two long flexible rods or wires similar to those which had lifted us from our ship into our prison. I saw a dozen more of these rods coiled up, hanging in the air, evidently, but really on the floor near the edge of the flyer, ready for use. Jim suddenly grasped me by the arm.

"Look behind you in a moment," he said, "but don't start!"

He took the notebook in his hand and started to draw a sketch. I looked behind as he had told me to.

Hanging in the air in a position which told me that they must have been in a different compartment of the flyer, were five children. They were white as marble, and lay perfectly motionless.

"Are they dead, Jim?" I asked in a low voice without looking at him.

"I don't know," he replied, "but we'll find out a little later. I am relieved to find them here, and I doubt if they are harmed."

The sketch which he was making was one of the solar system, and, when he had finished, he marked the earth with a cross and handed the notebook to one of the beetles. The insect took it and showed it to his companions; so far as I was able to judge expressions, they were amazed to find that we had knowledge of the heavenly bodies. The beetle took Jim's pencil in

one of its hands and, after examining it carefully, made a cross on the circle which Jim had drawn to represent the planet Mercury.

"They come from Mercury," exclaimed Jim in surprise as he showed me the sketch. "That accounts for a good many things; why they are so lethargic, for one thing. Mercury is much smaller than the earth and the gravity is much less. According to Mercurian standards, they must weigh a ton each. It is quite a tribute to their muscular development that they can move and support their weight against our gravity. They can understand a drawing all right, so we have a means of communicating with them, although a pretty slow one and dependent entirely on my limited skill as a cartoonist. I wonder if we are free to move about?"

"The only way to find out is to try," I replied and stood erect. The beetles offered no objection and Jim stood up beside me. We walked, or rather edged, our way toward the side of the ship. The insects watched us when we started to move and then evidently decided that we were harmless. They turned from us to the working of the ship. One of them manipulated some

dials on the instrument board. One of the rods which held our flyer released its grip, came in toward the Mercurian ship and coiled itself up on the floor, or the place where the floor should have been. The insect touched another dial. Jim threw caution to the winds, raced across the floor and grasped the beetle by the arm.

The insect looked at him questioningly; Jim produced the notebook and drew a sketch representing our flyer falling. On the level he had used to represent the ground he made another sketch of it lying in ruins. The beetle nodded comprehendingly and turned to another dial; the ship sank slowly toward the ground.

We sank until we hung only a few feet from the ground when our flyer was gently lowered down. When it rested on the ground, the wire which had held it uncoiled, came aboard and coiled itself up beside the others. As the Mercurian ship rose I noticed idly that the door which had been torn from our ship and dropped lay within a few yards of the ship itself. The Mercurian ship rose to an elevation of a hundred feet, drifting gently over the city.

As we rose I determined to try the effect of my personality on the beetles. I approached the one who seemed to be the leader and, putting on the most woeful expression I could muster, I looked at the floor. He did not understand me and I pretended that I was falling and grasped at him. This time he nodded and stepped to the instrument board. In a moment the floor became visible. I thanked him as best I could in pantomime and approached the walls. They were so transparent that I felt an involuntary shrinking as I approached them. I edged my way cautiously forward until my outstretched hand encountered a solid substance. I looked out.

At the slow speed we were traveling the drone of our motors was hardly audible to us, and I felt sure that it could not be heard on the ground. Once their curiosity was satisfied, our captors paid little or no attention to me and left me free to come and go as I wished. I made my way cautiously toward the children, but ran into a solid wall. Remembering Jim's words, I made my way back toward him without displaying any interest.

Jim could probably have wandered around as I did had he wished, but he chose to occupy his time differently. With his notebook and pencil he carried on an extensive conversation, if that term can be applied to a crudely executed set of drawings, with the leader of the beetles. I was not especially familiar with the methods of control of space ships and I could make nothing of the maze of dials and switches on the instrument board.

For half an hour we drifted slowly along. Presently one of the beetles approached, seized my arm and turned me about. With one of his arms he pointed ahead. A mile away I could see another space flyer similar to the one we were on.

"Here comes another one, Jim." I called.

"Yes, I saw it some time ago. I don't know where the third one is."

"Are there three of them?"

"Yes. Three of them came here yesterday and are

exploring the country round about here. They are scouts sent out from the fleet of our brother planet to see if the road was clear and what the world was like. They spotted the hole through the layer with their telescope and sent their fleet out to pay us a visit. He tells me that the scouts have reported favorably and that the whole fleet, several thousand ships, as near as I can make out, are expected here this evening."

"Have you solved the secret of their invisibility?"

"Partly. It is as I expected. The walls of the ship are double, the inner one of metal and the outer one of vitrolene or some similar perfectly transparent substance. The space between the walls is filled with some substance which will bend both visible and ultra-violet rays along a path around the ship and then lets them go in their original direction. The reason why we can see through the walls and see the protective coating of that ship coming is that they are generating some sort of a ray here which acts as a carrier for the visible light rays. I don't know what sort of a ray it is, but when I get a good look at their generators, I may be able to tell. Are you beginning to

itch and burn?"

"Yes, I believe that I am, although I hadn't noticed it until you spoke."

"I have been noticing it for some time. From its effects on the skin, I am inclined to believe it to be a ray of very short wave-length, possibly something like our X-ray, or even shorter."

"Have you found out what they intend to do with us?"

"I don't think they have decided yet. Possibly they are going to take us up to the leader of their fleet and let him decide. The cuss that is in command of this ship seems surprised to death to find out that I can comprehend the principles of his ship. He seems to think that I am a sort of a rara avis, a freak of nature. He intimated that he would recommend that we be used for vivisection."

"Good Lord!"

"It's not much more worse than the fate they design

for the rest of their captives, at that."

"What is that?"

"It's a long story that I'll have to tell you later. I want to watch this meeting."

The other ship had approached to within a few yards and floated stationary, while some sort of communication was exchanged between the two. I could not fathom the method used, but the commander of our craft clamped what looked like a pair of headphones against his body and plugged the end of a wire leading from them into his instrument board. From time to time various colored lights glowed on the board before him. After a time he uncoupled his device from the board, and one of the long rods shot out from our ship to the other. It returned in a moment clamped around the body of a young girl. As she came on board, she was lowered onto the deck beside the other children. Like them, she was stiff and motionless. I gave an exclamation and sprang forward.

"Pete!"

Jim's voice recalled me to myself, and I watched the child laid with the others with as disinterested an expression as I could muster. I had never made a mistake in following Jim Carpenter's lead and I knew that somewhere in his head a plan was maturing which might offer us some chance of escape.

Our ship moved ahead down a long slant, gradually dropping nearer to the ground. I watched the maneuver with interest while Jim, with his friend the beetle commander, went over the ship. The insect was evidently amused at Jim and was determined to find out the limits of his intelligence, for he pointed out various controls and motors of the ship and made elaborate sketches which Jim seemed to comprehend fairly well.

One of the beetles approached the control board and motioned me back. I stepped away from the board; evidently a port in the side of the vessel opened, for I felt a breath of air and could hear the hum of the city. I walked to the side and glanced down, and found that

we were floating about twenty feet off the ground over a street on the edge of the city. On the street a short distance ahead of us two children, evidently returning from school, to judge by the books under their arms, were walking unsuspectingly along. A turn of the dial sped up our motors, and as the hum rang out in a louder key the children looked upward. Two of the long flexible wires shot out and wrapped themselves about the children; screaming, they were lifted into the space flyer. The port through which they came in shut with a clang and the ship rose rapidly into the air. The children were released from the wires which coiled themselves up on deck and the beetle who had operated them stepped forward and grasped the nearer of the children, a boy of about eleven, by the arm. He raised the boy, who was paralyzed with terror, up toward his head and gazed steadily into his eyes. Slowly the boy ceased struggling and became white and rigid. The beetle laid him on the deck and turned to the girl. Involuntarily I gave a shout and sprang forward, but Jim grasped me by the arm.

"Keep quiet, you darned fool!" he cried. "We can do nothing now. Wait for a chance!"

"We can't stand here and see murder done!" I protested.

"It's not murder. Pete, those children aren't being hurt. They are being hypnotized so that they can be transported to Mercury."

"Why are they taking them to Mercury?" I demanded.

"As nearly as I can make out, there is a race of men up there who are subject to these beetles. This ship is radium propelled, and the men and women are the slaves who work in the radium mines. Of course the workers soon become sexless, but others are kept for breeding purposes to keep the race alive. Through generations of in-breeding, the stock is about played out and are getting too weak to be of much value.

"The Mercurians have been studying the whole universe to find a race which will serve their purpose and they have chosen us to be the victims. When their

fleet gets here, they plan to capture thousands of selected children and carry them to Mercury in order to infuse their blood into the decadent race of slaves they have. Those who are not suitable for breeding when they grow up will die as slaves in the radium mines."

"Horrible!" I gasped. "Why are they taking children, Jim? Wouldn't adults suit their purpose better?"

"They are afraid to take adults. On Mercury an earthman would have muscles of unheard of power and adults would constantly strive to rise against their masters. By getting children, they hope to raise them to know nothing else than a life of slavery and get the advantage of their strength without risk. It is a clever scheme."

"And are we to stand here and let them do it?"

"Not on your life, but we had better hold easy for a while. If I can get a few minutes more with that brute I'll know enough about running this ship that we can afford to do away with them. You have a pistol,

haven't you?"

"No."

"The devil! I thought you had. I have an automatic, but it only carries eight shells. There are eleven of these insects and unless we can get the jump on them, they'll do us. I saw what looks like a knife lying near the instrument board; get over near it and get ready to grab it as soon as you hear my pistol. These things are deaf and if I work it right I may be able to do several of them in before they know what's happening. When you attack, don't try to ram them in the back; their backplates are an inch thick and will be proof against a knife thrust. Aim at their eyes; if you can blind them, they'll be helpless. Do you understand?"

"I'll do my best, Jim," I replied. "Since you have told me their plans I am itching to get at them."

I edged over toward the knife, but as I did so I saw a better weapon. On the floor lay a bar of silvery metal about thirty inches long and an inch in diameter. I

picked it up and toyed with it idly, meanwhile edging around to get behind the insect which I had marked for my first attentions. Jim was talking again by means of the notebook with his beetle friend. They walked around the ship, examining everything in it.

"Are you ready, Pete?" came Jim's voice at last.

"All set," I replied, getting a firmer grasp on my bar and edging toward one of the insects.

"Well, don't start until I fire. You notice the bug I am talking to? Don't kill him unless you have to. This ship is a little too complicated for me to fathom, so I want this fellow taken prisoner. We'll use him as our engineer when we take control."

"I understand."

"All right, get ready."

I kept my eye on Jim. He had drawn the beetle with whom he was talking to a position where they were behind the rest. Jim pointed at something behind the

insect's back and the beetle turned. As it did so, Jim whipped out his pistol and, taking careful aim, fired at one of the insects.

As the sound of the shot rang out I raised my bar and leaped forward. I brought it down with crushing force on the head of the nearest beetle. My victim fell forward, and I heard Jim's pistol bark again; but I had no time to watch him. As the beetle I struck fell the others turned and I had two of them coming at me with outstretched arms, ready to grasp me. I swung my bar, and the arm of one of them fell limp; but the other seized me with both its hands, and I felt the cruel hooks of its lower arms against the small of my back.

One of my arms was still free; I swung my bar again, and it struck my captor on the back of the head. It was stunned by the blow and fell. I seized the knife from the floor, and threw myself down beside it and struck at its eyes, trying to roll it over so as to protect me from the other who was trying to grasp me.

I felt hands clutch me from behind; I was wrenched

loose from the body of my victim and lifted into the air. I was turned about and stared hard into the implacable crystalline eyes of one of the insects. For a moment my senses reeled and then, without volition, I dropped my bar. I remembered the children and realized that I was being hypnotized. I fought against the feeling, but my senses reeled and I almost went limp, when the sound of a pistol shot, almost in my ear, roused me. The spell of the beetle was momentarily broken. I thrust the knife which I still grasped at the eyes before me. My blow went home, but the insect raised me and bent me toward him until my head lay on top of his and the huge horns which adorned his head began to close. Another pistol shot sounded, and I was suddenly dropped.

I grasped my bar as I fell and leaped up. The flyer was a shambles. Dead insects lay on all sides while Jim, smoking pistol in hand, was staring as though fascinated into the eyes of one of the surviving beetles. I ran forward and brought my bar down on the insect's head, but as I did so I was grasped from behind.

"Jim, help!" I cried as I was swung into the air. The insect whirled me around and then threw me to the floor. I had an impression of falling; then everything dissolved in a flash of light. I was unconscious only for a moment, and I came to to find Jim Carpenter standing over me, menacing my assailant with his gun.

"Thanks, Jim," I said faintly.

"If you're conscious again, get up and get your bar," he replied. "My pistol is empty and I don't know how long I can run a bluff on this fellow."

I scrambled to my feet and grasped the bar. Jim stepped behind me and reloaded his pistol.

"All right," he said when he had finished. "I'll take charge of this fellow. Go around and see if the rest are dead. If they aren't when you find them, see that they are when you leave them. We're taking no prisoners."

I went the rounds of the prostrate insects. None of them were beyond moving except two whose heads

had been crushed by my bar, but I obeyed Jim's orders. When I rejoined him with my bloody bar, the only beetle left alive was the commander, whom Jim was covering with his pistol.

"Take the gun," he said when I reported my actions, "and give me the bar."

We exchanged weapons and Jim turned to the captive.

"Now, old fellow," he said grimly, "either you run this ship as I want you to, or you're a dead Indian. Savvy?"

He took his pencil and notebook from his pocket and drew a sketch of our Hadley space ship. On the other end of the sheet he drew a picture of the Mercurian ship, and then drew a line connecting the two. The insect looked at the sketch but made no movement.

"All right, if that's the way you feel about it," said Jim. He raised the bar and brought it down with crushing force on one of the insect's lower arms. The arm fell as though paralyzed and a blue light played across the beetle's eyes. Jim extended the sketch again and

raised the bar threateningly. The beetle moved over to the control board, Jim following closely, and set the ship in motion. Ten minutes later it rested on the ground beside the ship in which we had first taken the air.

Following Jim's pictured orders the beetle opened the door of the Mercurian ship and followed Jim into the Hadley. As we emerged from the Mercurian ship I looked back. It had vanished completely.

"The children, Jim!" I gasped.

"I haven't forgotten them," he replied, "but they are all right for the present. If we turned them loose now, we'd have ninety reporters around us in ten minutes. I want to get our generators modified first."

He pointed toward the spot where the Mercurian ship had stood and then toward our generators. The beetle hesitated, but Jim swung his bar against the insect's side in a vicious blow. Again came the play of blue light over the eyes; the beetle bent over our generators and set to work. Jim handed me the bar

and bent over to help. They were both mechanics of a high order and they worked well together; in an hour the beetle started the generators and swung one of the searchlights toward his old ship. It leaped into view on the radium coated screen.

"Good business!" ejaculated Jim. "We'll repair this door; then we'll be ready to release the children and start out."

We followed the beetle into the Mercurian ship, which it seemed to be able to see. It opened a door leading into another compartment of the flyer, and before us lay the bodies of eight children. The beetle lifted the first one, a little girl, up until his many-faceted eyes looked full into the closed ones of the child. There was a flicker of an eyelash, a trace of returning color, and then a scream of terror from the child. The beetle set the girl down and Jim bent over her.

"It's all right now, little lady," he said, clumsily smoothing her hair.

"You're safe now. Run along to your mother. First

Mortgage, take charge of her and take her outside. It isn't well for children to see these things."

The child clung to my hand: I led her out of the ship, which promptly vanished as we left it. One by one, seven other children joined us, the last one, a miss of not over eight, in Jim's arms. The beetle followed behind him.

"Do any of you know where you are?" asked Jim as he came out.

"I do, sir," said one of the boys. "I live close to here."

"All right, take these youngsters to your house and tell your mother to telephone their parents to come and get them. If anyone asks you what happened, tell them to see Jim Carpenter to-morrow. Do you understand?"

"Yes, sir."

"All right, run along then. Now, First Mortgage, let's go hunting."

We wired our captive up so securely that I felt that there was no possible chance of his escape; then, with Jim at the controls and me at the guns, we fared forth in search of the invaders. Back and forth over the city we flew without sighting another spaceship in the air. Jim gave an exclamation of impatience and swung on a wider circle, which took us out over the water. I kept the searchlights working. Presently, far ahead over the water, a dark spot came into view. I called to Jim and we approached it at top speed.

"Don't shoot until we are within four hundred yards," cautioned Jim.

I held my fire until we were within the specified distance. The newcomer was another of the Mercurian space-ships; with a feeling of joy I swung my beam until the cross-hairs of the screen rested full on the invader.

"All ready!" I sung out.

"If you are ready, Gridley, you may fire!" replied Jim. I pressed the gun button. The crash of the gun was

followed by another report from outside as the radite shell burst against the Mercurian flyer. The deadly explosive did its work, and the shattered remains of the wreck fell, to be engulfed in the sea below.

"That's one!" cried Jim. "I'm afraid we won't have time to hunt up the other right now. This bug told me that the other Mercurians are due here to-day, and I think we had better form ourselves into a reception committee and go up to the hole to meet them."

He sent the ship at high speed over the city until we hovered over the laboratory. We stopped for a moment, and Jim stepped to the radio telephone.

"Hello, Williams," he said, "how are things going? That's fine. In an hour, you say? Well, speed it up as much as you can; we may call for it soon."

He turned both stern motors to full power, and we shot up like a rocket toward the hole in the protective layer through which the invaders had entered. In ten minutes we were at the altitude of the guard ships and Jim asked if anything had been seen. The report

was negative; Jim left them below the layer and sent our flyer up through the hole into space. We reached the outer surface in another ten minutes and we were none too soon. Hardly had we debouched from the hole than ahead of us we saw another Mercurian flyer. It was a lone one, and Jim bent over the captive and held a hastily made sketch before him. The sketch showed three Mercurian flyers, one on the ground, one wrecked and the third one in the air. He touched the drawing of the one in the air and pointed toward our port hole and looked questioningly at the beetle. The insect inspected the flyer in space and nodded.

"Good!" cried Jim. "That's the third of the trio who came ahead as scouts. Get your gun ready, First Mortgage: we're going to pick him off."

Our ship approached the doomed Mercurian. Again I waited until we were within four hundred yards; then I pressed the button which hurled it, a crumpled wreck, onto the outer surface of the heaviside layer.

"Two!" cried Jim as we backed away.

"Here come plenty more," I cried as I swung the searchlight. Jim left his controls, glanced at the screen and whistled softly. Dropping toward us from space were hundreds of the Mercurian ships.

"We got here just in time," he said. "Break out your extra ammunition while I take to the hole. We can't hope to do that bunch alone, so we'll fight a rearguard action."

Since our bow gun would be the only one in action, I hastily moved the spare boxes of ammunition nearer to it while Jim maneuvered the Hadley over the hole. As the Mercurian fleet came nearer he started a slow retreat toward the earth. The Mercurians overtook us rapidly; Jim locked his controls at slow speed down and hurried to the bow gun.

"Start shooting as soon as you can," he said. "I'll keep the magazine filled."

I swung the gun until the cross-hairs of the screen rested full on the leading ship and pressed the button. My aim was true, and the shattered fragments of the

ship fell toward me. The balance of the fleet slowed down for an instant; I covered another one and pressed my button. The ship at which I had aimed was in motion and I missed it, but I had the satisfaction of seeing another one fall in fragments. Jim was loading the magazine as fast as I fired. I covered another ship and fired again. A third one of our enemies fell in ruins. The rest paused and drew off.

"They're retreating, Jim!" I cried.

"Cease firing until they come on again," he replied as he took the shells from the magazines of the other guns and piled them near the bow gun.

I held my fire for a few minutes. The Mercurians retreated a short distance and then came on again with a rush. Twenty times my gun went off as fast as I could align it and press the trigger, and eighteen of the enemy ships were in ruins. Again the Mercurians retreated. I held my fire. We were falling more rapidly now and far below we could see the black spots which were the guard ships. I told Jim that they were in sight; he stepped to the radio telephone and ordered

them to keep well away from the hole.

Again the Mercurian ships came on with a rush, this time with beams of orange light stabbing a way before them. When I told Jim of this he jumped to the controls and shot our ship down at breakneck speed.

"I don't know what sort of fighting apparatus they have, but I don't care to face it," he said to me. "Fire if they get close; but I hope to get out of the hole before they are in range."

Fast as we fell, the Mercurians were coming faster, and they were not over eight hundred yards from us when he reached the level of the guard ships. Jim checked our speed; I managed to pick off three more of the invaders before we moved away from the hole. Jim stopped the side motion and jumped to the radio telephone.

"Hello, Williams!" he shouted into the instrument.

"Are you ready down there? Thank God! Full power at once, please!

"Watch what happens," he said to me, as he turned from the instrument.

Some fifty of the Mercurian flyers had reached our level and had started to move toward us before anything happened. Then from below came a beam of intolerable light. Upward it struck, and the Mercurian ships on which it impinged disappeared in a flash of light.

"A disintegrating ray," explained Jim. "I suspected that it might be needed and I started Williams to rigging it up early this morning. I hated to use it because it may easily undo the work that six years have done in healing the break in the layer, but it was necessary. That ends the invasion, except for those ten or twelve ships ahead of us. How is your marksmanship? Can you pick off ten in ten shots?"

"Watch me," I said grimly as the ship started to move.

Pride goeth ever before a fall: it took me sixteen shots to demolish the eleven ships which had escaped destruction from the ray. As the last one fell in ruins,

Jim ordered the ray shut off. We fell toward the ground.

"What are we going to do with our prisoner?" I asked.

Jim looked at the beetle meditatively.

"He would make a fine museum piece if he were stuffed," he said, "but on the whole, I think we'll let him go. He is an intelligent creature and will probably be happier on Mercury than anywhere else. What do you say that we put him on his ship and turn him loose?"

"To lead another invasion?" I asked.

"I think not. He has seen what has happened to this one and is more likely to warn them to keep away. In any event, if we equip the guard ships with a ray that will show the Mercurian ships up and keep the disintegrating ray ready for action, we needn't fear another invasion. Let's let him go."

"It suits me all right, Jim, but I hold out for one thing.

I will never dare to face McQuarrie again if I fail to get a picture of him. I insist on taking his photograph before we turn him loose."

"All right, go ahead," laughed Jim. "He ought to be able to stand that, if you'll spare him an interview."

An hour later we watched the Mercurian flyer disappear into space.

"I hope I've seen the last of those bugs," I said as the flyer faded from view.

"I don't know," said Jim thoughtfully. "If I have interpreted correctly the drawings that creature made, there is a race of manlike bipeds on Mercury who are slaves to those beetles and who live and die in the horrible atmosphere of a radium mine. Some of these days I may lead an expedition to our sister planet and look into that matter."

#35 Earth, The Marauder, By Arthur Josephus Burks:

Out of her orbit sped the teeming Earth—a marauding planet bent on starry conquest.

2023 Editor's note:

I have added different symbols to differentiate between the secret hand code, [in brackets], and telepathic communication, in ::double colons::, to help show the differences between different communication types since it's important to the plot.

In some areas it's not clear whether the characters are speaking aloud, telepathically, or with the secret

hand code, so any parts left unclear are left in normal “quotation marks”. There may also be sections where it’s obvious but I forgot to mark them.

Foreword

Despite the fact that for centuries the Secret of Life had been the possession of children of men, the Earth was dying. She was dying because the warmth of the sun was fading; because, with the obliteration of the oceans in order to find new land upon which men might live, her seasons had become stormy, unbearably cold and dreary: and the very fact of her knowledge of the Secret of Life, in which men numbered their ages by centuries instead of by years, was her undoing.

For when men did not die, they multiplied beyond all counting, beyond all possibility of securing permanent abiding places. One man, in the days when the earth was young, and man lived at best to the age of three score years and ten, could have, given time and opportunity, populated a nation. Now, when men lived for centuries, eternally youthful, their living descendants ran into incalculable numbers.

The earth—strange paradox—was dying because it had learned the Secret of Life. Twenty centuries

before, the last war of aggression had been fought, in order that an over-populated nation might find room in which to live. Now all the earth was one nation, speaking one tongue—and there were no more lands to conquer.

Chapter 1: Sarka

In his laboratory atop the highest peak in the venerable Himalayas, lived Sarka, conceded by the world to be its greatest scientist, despite his youth. His grandfather, who had watched the passing of eighteen centuries, had discovered the Secret of Life and thoughtlessly, in the light of later developments, broadcast his discovery to the world. The genius of this man, who was also called Sarka, had been passed on to his son, Sarka the Second, and by him in even greater degree to Sarka the Third ... called merely Sarka for the purposes of this history.

Had Sarka lived in the days before the discovery of the Secret of Life, people of that day would have judged him a young man of twenty. His real age was four centuries.

Behind him as he sat moodily staring at the gigantic Revolving Beryl stood a woman of most striking appearance. Her name was Jaska, and according to ideas of the Days Before the Discovery, she seemed a trifle younger than Sarka. Her hand, unadorned by

jewelry of any kind, rested on Sarka's shoulder as he studied the Revolving Beryl, while her eyes, whose lashes, matching her raven hair, were like the wings of tiny blackbirds, noted afresh the wonder of this man.

"What is to be done?" she asked him at last, and her voice was like music there in the room where science performed its miracles for Sarka.

Wearily Sarka turned to face her, and she was struck anew, as she had been down the years since she had known this man, every time their glances met, at the mighty curve of his brow, which rendered insignificant his mouth, his delicate nose of the twitching nostrils, the well-deep eyes of him.

"Something must be done," he said gloomily, "and that soon! For, unless the children of men are provided with some manner of territorial expansion, they will destroy one another, only the strongest will survive, and we shall return to the days when the waters covered the earth, and monstrous creatures bellowed from the primeval slime!"

"You are working on something?" she asked softly.

For a moment he did not answer. While she waited, Jaska peered into the depths of the Revolving Beryl, which represented the earth. It was fifty feet in diameter, and in its curved surface and entrancing depths was mirrored, in this latest development of televue, all the earth and the doings of its people. But Jaska scarcely saw the fleeting images, the men locked in conflict for the right to live, the screaming, terror-stricken women. This was now a century-old story, and the civilization of Earth had almost reached the breaking point.

No, she scarcely saw the things in the Beryl, for she had read the hint of a vast, awesome secret in the eyes of Sarka—and wondered if he dared even tell her.

"If the people knew," he whispered, "they would do one of two things! They would tear me limb from limb, and hurl the parts of me outward into space forever—or they would demand that I move before I am ready—and cause a catastrophe which could

never be rectified; and this grand old Earth of ours would be dead, indeed!"

[And this secret of yours?] Jaska now spoke in the sign language which only these two knew, for there were billions of other Revolving Beryls in the world, and words could be heard by universal radio by any who cared to listen. And always, they knew, the legions of enemies of Sarka kept their ears open for words of Sarka which could be twisted around to his undoing.

[I should not tell even you,] he answered, his fingers working swiftly in their secret, silent language, which all the world could see, but which only these two understood. [For if my enemies knew that you possessed the information, there is nothing they would stop at to make you tell.]

"But I would not tell, Sarka," she said softly. "You know that!"

He patted her hands, and the ghost of a smile touched his lips.

"No," he said, "you would not tell. Some day soon—and it must be soon if the children of men are not to destroy themselves, I will tell you! It is a secret that lies heavily on my heart. If I should make a mistake.... Chaos! Catastrophe! Eternal, perpetual dark, the children of men reduced to nothingness!"

A little gasp from Jaska, for it was plain that this thing Sarka hinted at was far and away beyond anything he had hitherto done—and Sarka had already performed miracles beyond any that had ever been done by his predecessors.

"When my grandfather," went on Sarka moodily, "perfected, in this self-same laboratory, the machinery by which the waters of the oceans could be disintegrated, our enemies called him mad, and fought their way up these mountain slopes to destroy him! With the pack at his doors, he did as he had told them he would do. Though they hurried swiftly into the great valleys to colonize them—where oceans had been—they were like ravening beasts, and gave my grandfather no thanks. Our people have always fought against progress, have always been

disparaging of its advocates! When the first Sarka discovered the Secret they would have destroyed him, though he made them immortal...."

"If only the Secret," interrupted Jaska, "could be returned to him who discovered it! That would solve our problem, for men then would die and be buried, leaving their places for others."

Again that weary smile on the face of Sarka.

"Take back the Secret which is known to-day to every son and daughter of woman? Impossible! More nearly impossible than the attainment of my most ambitious dream!"

[And that dream?] spoke Jaska with speeding fingers.

"I have wondered about you," said Sarka softly, while those eyes of his bored deeply into hers. "We have been the best of friends, the best of comrades; but there are times when it comes to me that I do not know you entirely! And I have many enemies!"

"You mean," gasped the woman, for the moment forgetting the secret sign manual, "you think it possible that I—I—might be one of your enemies, in secret?"

"Jaska, I do not know; but in this matter in my mind I trust no one. I am afraid even that people will read my very thoughts, though I have learned to so concentrate upon them that not the slightest hint of them shall go forth telepathically to my enemies! I do not mind death for myself; but our people must be saved! It is hideous to think that we have been given the Secret of Life, only to perish in the end because of it! I am sorry, Jaska, but I can tell no one!"

But Jaska, one of the most beautiful and intelligent of Earth's beautiful and intelligent women, seemed not to be listening to Sarka at all, and when he had finished, she shrugged her shoulders slightly and prepared to leave.

He followed her to the nearest Exit Dome, built solidly into the side of his laboratory, and watched her as she slipped swiftly into the white, skin-tight clothing—

marked on breast and back with the Red Lily of the House of Cleric. His eyes still were deeply moody.

He helped her don the gleaming metal helmet in whose skull-pan was set the Anti-Gravitational Ovoid—invented by Sarka the Second, used now of necessity by every human creature—and strode with her to the Outer Exit, a door of ponderous metal sufficiently strong to prevent the inner warmth of the laboratory getting out, or the biting cold of the heights to enter, and studied her still as she buckled about her hips her own personal Sarka-Belt, which automatically encased her, through contact with her tight clothing, with the warmth and balanced pressure of the laboratory, which would remain constant as long as she wore it.

With a nod and a brief smile, she stepped to the metal door and vanished through it. Sarka turned gloomily back to his laboratory. Looking into the depths of the Revolving Beryl and adjusting the enlarging device which brought back, life size, the infinitesimal individuals mirrored in the Beryl, he watched her go—a trim white figure which flashed across the void,

from mountain-top to her valley home, like a very white projectile from another world. Very white, and very precious, but....

When she was home, and had waved to him that she had arrived safely, he forgot her for a time, and allowed his eyes to study the inner workings of this vast, crowded world whose on-rushing fate was so filling his brain with doubt, with fear—and something of horror!

Chapter 2: The People of the Hives

Moodily Sarka stared into the depths of the Beryl, which represented the Earth, and in which he could see everything that earthlings did, after visually enlarging them, through use of a microscope that could be adjusted, with relation to the Beryl, to bring out in detail any section of the world he wished to study. His face was utterly sad. The people at last truly possessed the Earth—all of it that was, even with the aid of every miracle known to science, habitable.

The surface of the Earth was one vast building, like a hive, and to each human being was allotted by law a certain abiding place. But men no longer died, unless they desired to do so, and then only when the Spokesmen of the Gens saw fit to grant permission; and there soon would be no place for the newborn to live. Even now that point had practically been reached throughout the world, and in the greater portion it *had* been reached, and passed, and men knew that while men did not die, they could be killed!

The vast building, towering above what had once been the surface of the earth, to heights undreamed of before the discovery, was irregular on its top, to fit the contour of the earth, and its roof, constructed of materials raped from the earth's core, was so designed as to catch and concentrate the yearly more feeble rays of the sun, so that its life-giving warmth might continue to be the boon of living people.

It had been found as Earth cooled that life was possible to a depth of eight miles below the one-time surface, so that the one huge building extended below the surface to this great depth, and was divided and re-divided to make homes for men, their wives, and their progeny. But even so, space was limited. Neighboring families outgrew their surroundings, overflowed into the habitations of their neighbors—and every family was at constant war against its neighbors.

Men did not die, but they could be slain, and there was scarcely a home, above or below, in all the vast building, which had not planned and executed murder, times and times—or which had not left its

own blood in the dwelling places of neighbors.

No law could cope with this intolerable situation, for men, down the ages, had changed in their essential characteristics but little—and recognized one law only in their extremity, that of self-preservation.

So there was murder rampant, and mothers who wept for children, husbands, fathers or mothers, who would never return to their homes.

"My grandfather," whispered Sarka, his eyes peering deeply into a certain area beyond that assigned by law to the House of Cleric, where men of two neighboring families were locked in mortal, silent conflict, "should not have frustrated the mad scheme of Dalis! It was slaughter, wholesale and terrible, but it would have cleansed the souls of the survivors!"

Mentally Sarka was looking back now to that red day when Dalis, the closest scientific rival of Sarka the First, had come to Sarka the First with his proposal which at the time had seemed so hideous. Sarka remembered that interval in all its details, for he had

heard it many times.

"Sarka," Dalis had said in his high-pitched voice, staring at Sarka the First out of red-rimmed, fiery eyes, "unless something is done the world will rush on to self-destruction! Men will slay one another! Fathers will kill their sons, and sons their fathers, if something is not done! For always there is marrying and giving in marriage, and each family is reaching out in all directions, seeking merely space in which to live. Formerly there were wars which automatically took thought of the overplus of men; but to-day the world is at peace, as men regard the term—and every man's hand is against his neighbor! There will be no more wars, when there should be! There is but one alternative!"

"And that?" Sarka the First had queried suspiciously.

"The segregation of the fittest! The destruction, swiftly, painlessly, of all the others! And when the survivors have again re-populated the earth to overflowing—a repetition of the same corrective! Men will die, yes, by millions; but those who are left will be

a stronger, sturdier race, and by this process of elimination, century by century, men will evolve and become super-men!"

"And this plan of yours?"

For a moment Dalis had paused, breathing heavily, as though almost afraid to continue. Then, while Sarka the First had listened in frozen terror, Dalis had explained his ghastly scheme.

"If it were not for the mountains and the valleys," said Dalis, "and the world were perfectly round and smooth of surface, that surface would be covered by water to the depth of one mile! Is that not correct! The Earth, rotating on its axis, travels about the sun at the rate of something like nineteen miles per second, so perfectly balanced that the oceans remain almost quiescent in their beds! But, Sarka, mark me well! If we could, together, devise a way to halt this rotation for as much as a few seconds, what would happen?"

"What would happen?" repeated Sarka the First,

dropping his own voice to a husky, frightened whisper. "Why, the oceans would be hurled out of their beds, and a wall of water a mile high or more—it is all guesswork!—would rush eastward around the world, bearing everything before it! It would uproot and destroy buildings, sweep the rocky covering of the earth free of soil; and humanity, caught on the earth below the highest level of the world's greatest tidal wave, would be engulfed!"

"Exactly!" Dalis had said with a grin. "Exactly! Only—the people we wish to survive could be warned, and these could either be aloft when the tidal wave swept the face of the earth, or could be safely out of reach of the waters on the sides of the highest mountains!"

Sarka the First, wanly smiling, catching his breath at last, now that he realized the utter impossibility of this mad scheme, had been minded to humor the fancies of a man whom he had believed not quite sane.

"Why not," he began, "take away from men the Secret of Life, so that they will die, as formerly, when the

world was young?"

"When all the world knows the Secret, when even children learn it before they are capable of walking?" demanded Dalis sarcastically. "You could only remove knowledge of the Secret from the brains of men by removing those brains themselves! Your thought is more terrible even than mine, because it leads to this inescapable conclusion!"

"But supposing for a moment your mad scheme were possible, who should say whom, of all the earth's people, should be saved, whom sacrificed?"

"What better test could be given than that which I am proposing?" Dalis had snarled. "Those worthy of being saved would save themselves! Those who would perish would not be worth saving! As natural, as inescapable as the law of the survival of the fittest, which has been an axiom of life since men first crawled out of the slime and asked each other questions as they caught their first glimpses of the stars and pondered the reasons for them!"

"But where, then, was there any point in my giving to people the Secret of Life?"

"Had you paused to think," snapped Dalis, "you would never have done so! Your lust for power, and for fame, destroyed your foresight!"

"And is it not, Dalis," replied Sarka the First, softly, "for this, really, that you have come to me? To berate me? To throw at my head mad schemes impossible of accomplishment? I have always known you for an enemy, Dalis, because you are envious of what I have accomplished, what you sense that I will accomplish as time passes!"

"I do not love you, Sarka!" retorted Dalis frankly. "I despise you! Hate you! But I need the aid of that keen brain of yours! You see, hate you though I may, I do you honor still. I have something up here," tapping the dome of his brow, only less lofty than that of Sarka, "which you lack. You have something I have not, never can attain! But together we are complements, each of the other, and to the two of us this scheme is possible!"

"I am very busy, Dalis," Sarka the First had replied coldly. "I must ask you to leave me! What you propose is impossible, unthinkable!"

"So," retorted Dalis, "you think me mad? You think me incapable of perfecting this plan about whose details you have not even yet been informed! You would show me the door as though you were a king and I a slave—when kings and slaves vanished from the earth millenniums ago! Then listen to me, Sarka! I know how to do this thing about which I have told you. I can halt, for a brief moment only, the whirl of the earth about its axis. And by so doing I can flood the earth with the waters of the oceans! If you will not listen to me, I shall do it myself! You shall have two days in which to give me an answer, for I admit that I need you, who would balance me, make sure I made no fatal mistakes! But if you do not, I will act ... along the lines I have hinted!"

Apparently as unconcerned as though he had not just listened to a scheme for almost total depopulation of the world, the destruction of millions upon millions of lives, Sarka the First had dismissed Dalis—who had

straightway used all his offices to arouse the world of science against the first Sarka.

But, when the two days of grace given by Dalis had passed, there were no oceans—for Sarka the First had been planning for a century against the time when the earth must of necessity be over-populated, and had worked and slaved in his laboratory against the contingency which had developed.

He had smiled, though there was a trace of fear on his face after Dalis had left, for *his* scheme had been worked out—not to destroy, but to save!

And from this same laboratory in which Sarka now sat and pondered on the next step in man's expansion, Sarka the First had, in fear and trembling at first, but with his confidence growing by leaps and bounds, worked his own miracle. Untold millions and billions of rays, whose any portion of which, coming in contact with water, immediately separated its hydrogen and oxygen, thus disintegrating its molecules, were hurled forth from their store-houses beneath the laboratory, across the faces of the mighty

oceans of Earth....

And when men saw the miracle, they rushed into the mighty valleys where the oceans had been, and began to build new homes!

That had been centuries ago—scores of centuries.

Now all the earth, all the livable part of the earth, above its surface—and below it to the depths of miles—was filled with people, like bees in a monster hive, like ants of antiquity in their warren hills. And there was no place now that they could go.

So they fought among themselves for the right to live.

"But my grandfather was right!" Sarka almost screamed it, speaking aloud in the silence of his laboratory. "My grandfather was right! Dalis was wrong! Science should be the science of Life, not of Death! Yet whither shall we go! Where now shall we find places for our people who are daily being born in myriads, to live, and love and flourish?"

But there was no answer. Only the humming of the perpetually revolving Beryl, which showed to the sad eyes of Sarka that the people of his beloved earth were rushing onward to Chaos, unless....

"If only I could be sure about Jaska!" he moaned. "If only my courage were as great as that of which I stand in need! For if I fail, even Dalis, had he succeeded with that scheme of his in grandfather's time, would be less a monster, less a criminal!"

Chapter 3: *The Spokesmen of the Gens*

For a long moment Sarka looked broodingly out across the world beyond the metalized glass which formed the curving dome of his laboratory roof. There was little that could be seen, for always the mighty, cold winds, ruffed with flurries of snow and particles of ice, swept over this artificial roof of the world. Here and there huge portions of the area within the range of his normal vision were swept clear and clean of snow and ice—and looked bluely, bitterly cold and hostile.

Without the Sarka-Belts, people who ventured forth from their hives would instantly freeze to the consistency of marble in those winds and storms. For the people of Earth had built their monster habitation toward the stars until they reached up into the altitude of perpetual cold.

Only under that gleaming roof was there warmth. Many of the men, and women, and children who had lost in the now century-old fight for survival had merely been tossed out of the hives. A painless, swift

death—but each death, in a world so highly specialized that each grown person fitted into his niche naturally and easily, was a distinct loss, not much, perhaps, but enough for the loss to be felt.

Sarka, closing his eyes for a moment as though to shut out a horror which in his mind he could visualize, turned back to the Revolving Beryl, in which he kept in constant touch with all parts of the world at will.

"It *must* be done!" he muttered. "I must take action. It means the loss of thousands, perhaps millions of lives, in such a war as the mind of man has not hitherto conceived; but for a Cause greater than any which has ever hitherto been an excuse for armed conflict. But I must discuss it with the Spokesmen of the Gens!"

On the table before Sarka was a row of vari-colored lights, whose source was beneath the floor of the laboratory, out of the heart of the master-mountain, part of the intricate machinery of this laboratory which had been almost twenty centuries in the perfecting. In the dwelling place of each of the

Spokesmen was a single light, colored like one of the lights on Sarka's table. To speak with any one of the Spokesmen Sarka had but to dim the properly colored light by covering it with the palm of his hand. The light in the home of the thus signalled Spokesman was dimmed, and the Spokesman would know that Sarka desired to converse with him.

Sarka noted the blue light, and shuddered. For if he covered it with his palm it would summon Dalis, a great scientist, but an erratic one, as Sarka the First had so clearly shown.

Sarka turned again to the Beryl. The area of which Dalis was Spokesman was, roughly speaking, that part of what had once been the Pacific Ocean, north of a line drawn east and west through the southernmost of the Hawaiian Islands, northward to the Pole. The home of Dalis was in the heart of what had once been an island historians claimed had been called Oahu, now a mountain peak still retaining a hint of the pre-Discovery name: Ohi.

The total number of the Spokesmen, the oldest of

earth's inhabitants, was twelve, and the remainder of the Earth not under the tutelary rule of Dalis was divided up among the other eleven Spokesmen. Cleric, for example, father of Jaska, was Spokesman of that area which men had once called Asia, the vast valleys of the once Indian Ocean and the Mediterranean; while the youngest of the Spokesmen, in a manner serving his apprenticeship, was tutelary head of the vast plateau once called Africa. The name of this man was Gerd.

“He, at least,” thought Sarka, thinking of each Spokesman in turn and cataloguing each in his mind, “will be with me. I wonder about the others, and especially Dalis. He has always hated us!”

Then, with the air of a man who has made up his mind and crosses his particular Rubicon in a single step, Sarka rose to his feet and passed along the row of vari-colored lights, covering each one with his hand in rapid succession.

Then he sat down again, almost holding his breath, and waited. As he stared at the row of lights his eyes

lingered longest on two which were almost golden in color—and his face was very gentle, almost reverent. For those two lights were signals to Sarka the First and Sarka the Second, his grandfather and his father!

It was Dalis, the irascible, the fiery tempered, the erratic, who first made answer.

"Yes! What is it now?"

Sarka smiled a trifle grimly as he spoke a single word.

"Wait!"

The voice of Dalis, which Sarka had good cause to remember, had sounded as loudly in the laboratory as though Dalis had been present there in person, for men had learned to communicate by voice almost without the aid of radio and its appurtenances though the principle upon which the first crude beginnings of radio were fashioned still applied. Each man's dwelling place was both a "sender" and a "receiver," and men could talk and be talked to no matter where they lived—individuals telepathically summoned at

desire of anyone wishing verbal contact.

"Gerd is here!" came the voice of that Spokesman.

To him also Sarka spoke one word.

"Wait!"

"I am here, Sarka!" came a musical voice. "And Jaska is with me, listening!"

That would be Cleric, loyal friend, master scientist, but always shy of contact with people, though swift to anger and self-forgetfulness when he knew himself right and was opposed. Sarka darted a look back at the Revolving Beryl, adjusted swiftly the Beryl-microscope, and smiled into the faces of Jaska and Cleric, who looked enough alike that they might have been brother and sister, though Cleric had been born ten centuries before his daughter Jaska. They smiled back at him.

He shifted the Beryl-microscope and stared for a second at Dalis, there in the Beryl, and marked the

antagonism Dalis was at no pains to hide.

One by one the Spokesmen reported.

Klaser, from the Americas; Durce from the valleys of the vanished Atlantic; Boler from that part of the Artic Circle not included in the wedge which the Gens of Dalis thrust northward to the Pole: Vardee; Prull; Yuta; Aal; Vance and Hime. Each from his appointed area, each from the official headquarters of his Gens, the name given to those people who acknowledged the tutelage of a Spokesman. Each Spokesman, therefore, was the mouthpiece of millions of men, women and children. And over the Spokesmen, and not themselves Spokesmen, were three scientists: The Sarkas, First, Second and Third.

When all twelve of the Spokesmen had reported and been bidden by Sarka to wait, a smile touched the face of Sarka for an instant as two other voices, so nearly alike they might have been the voice of a single person, reported themselves.

"I am here, son! What is it?"

Oddly enough, Sarka's father and grandfather reported with exactly the same words. Sarka smiled at a whimsical thought of his own. It had been some time since the three scientist Sarkas had been together, and despite the vast differences in their ages they might have been triplets!

The reports were in and the Spokesmen were waiting; but for almost a minute Sarka waited still. Then he spoke swiftly those words for which there could be no recall:

"Gentlemen, the time is come when we must go to war!"

For a long moment after he had spoken there was no answer. Then it came, in the jeering laughter of the antagonistic Dalis.

"War? Against whom? The Sarkas are always dreaming!"

"And Dalis," continued Sarka, "shall be one of the leaders of Earthlings in this war which I am about to

propose! You doubtless recall a proposal you once made to Sarka the First? Your proposal to halt for a few moments the headlong whirl of the earth about its axis, thus to flood—"

"Stop!" interrupted Dalis. "Stop! Immediately!"

And Sarka stopped. He had forgotten, in the excitement of his urge to explain his plans, that the millions of people who gave official allegiance to Dalis had never been informed of the hideous proposal he had made, back there centuries ago, as a corrective for a world rapidly approaching over-population. Had his people known, never again would the voice of Dalis be heard in life. The Spokesmen knew, and the Sarkas; but no others. Sarka understood the protest of Dalis; honored it.

"Dalis," he went on, more softly, "after I have explained what I wish to do, you will come to me here, prepared to explain to me exactly how you planned doing what you proposed to my grandfather—for your knowledge will be necessary to me...."

"Isn't it enough that your grandfather stole from me, and amplified, an idea that would have made me forever famous, without his grandson also stealing the fruit of my brains?"

"Your brains," said Sarka sharply, "belong to your people. What I plan is for their betterment. But it means war, war which may last a century, two centuries, in which lives of countless thousands may be lost."

Sarka's last words were almost drowned out by the humming sound that came out of the Revolving Beryl, that perfected device which was the ultimate in the evolution of television and vibration-transference. Sarka's heart sank, for he knew the meaning of that sound. So did the Spokesmen.

"You see?" came the rasping voice of Dalis. "You hear? Look into your Beryl! See the clenched fists of the earth's myriads being shaken at you! Listen to the protests of the millions who hear your every word! See what Earthlings think of the prospect of war!"

For a moment Sarka spoke directly to the people.

"Be silent and listen! It will be war, yes; but not such a skulking, hideous war as ye wage among yourselves for a place to live! You, fathers, are guilty of slaying your sons! You, sons, of slaying your fathers! Merely by thrusting them forth from the hives, into the Outer Cold! This war I propose shall be a war that shall match your manhood, if ye indeed be men! Listen to me, and I will find for you new lands to conquer, new homes for your holding, if ye can take them!"

"But where," interrupted the sarcastic voice of Dalis, "are these new lands of which you speak? Inside the Earth? Already our hives reach into the Earth a distance of eight miles. Where else, then?"

"For shame, Dalis!" snapped Sarka, "and you a scientist! Every bit of habitable land on this globe is some man's dwelling place! Spokesmen of the Gens of Earth, look out your windows! Look out and upward—and read Dalis' answer in the stars!"

For a full minute there was silence throughout the

earth, and Sarka saw that the Spokesmen were doing his bidding. He himself looked out, out through the swirling storm which tore at the crest of the Himalayas, a dark and forbidding Outside, in the starred dome of which rode the pale orb moon!

"It is obvious, son," came the voice of Sarka the First, "what you mean. But how accomplish it?"

"Fifteen centuries ago, my father's father," cried Sarka, "Dalis told you that he possessed the power to halt for a moment the headlong whirl of the world on its axis about the sun! He could do it then—and no man, whatever he may think of Dalis as a man, has ever known him to lie! If, fifteen centuries ago, he could bring the whirling world to pause, why can we not, now...."

And, even though he had thought of this for years upon end, had spoken over and over to himself the words he was now using, rehearsing his proposed argument to the Spokesmen of the Gens, Sarka found himself for a moment almost afraid to continue and speak them.

"I understand, Sarka!" came the excited voice of Gerd, youngest of the Spokesmen. "And I follow wherever you think it best to lead! You mean ... you mean...."

"Exactly!" Sarka managed at last. "If the Earth can be stayed on its axis, it can be diverted from its orbit entirely! I know, for I have found the manner of its doing, though I need the genius of Dalis to check my work and my calculations! We have no new land on this Earth to conquer; but the Universe is filled with countless other worlds! What say ye, Spokesmen of the Gens? What say ye, Gens of Earth?"

But for the time of a thousand heartbeats neither the Spokesmen or the Gens made answer to Sarka, and all the world fell utterly silent, absorbing this unbelievable thing of which Sarka had hinted.

Over the metalized roof of the world the snows and storms, the winds and the wraiths of the long dead moaned and screamed as with an icy voice of abysmal warning.

And for the time of those thousand heartbeats, the world was pausing to listen.

When realization came, the answer would come from the Spokesmen and from the Gens; and here in the Sarka laboratory, his Rubicon crossed at last, sat Sarka, staring through the Beryl-microscope into the depths of the Revolving Beryl. His face was dead white, his eyes narrowed.

The first voice which came startled him.

"It is mad, Sarka! Mad! Mad! But I am with you, always!"

It was the voice of Jaska, daughter of Cleric!

Chapter 4: *The Earthlings Make Ready*

"I too, am with you!" came the voice of Gerd.

"Spoken like a child!" snapped Dalis. "For you are as much a child as this third of the dreaming Sarkas! The scheme is mad, madder even than Jaska intimates! The scheme I once proposed, in which I was cheated by the grandfather of this madman, was times and times more feasible and practicable!"

"Suppose," came the soft voice of Sarka the First, interrupting Dalis, "that you put the matter up to your Gens, O wise and noble Dalis, and see which scheme they would endorse if given the choice in the matter—and were your scheme still possible!"

This quickly silenced the vituperation of Dalis, but in no wise prevented his continuance as a rather loud antagonist of the plan.

"How," he demanded, "can you return the Earth to its orbit, even granting you are able to take this initial step? How keep life on the Earth during its flight on

this rainbow-chasing voyage you propose?"

"All these things have been taken into consideration, O Dalis!" retorted Sarka. "All of my scheme is practicable, as I think you will agree when I have told you its details. What think you of the plan, Klaser? And you, Durce? Boler? Vardee? Prull? Yuta? Aal? Vance? Hime?"

When the Spokesmen had answered, some of them hesitantly, for the people all this time had remained silent—and none of the Spokesmen could be sure how his own Gens would feel in the matter—it developed that seven of the Spokesmen were for the scheme, if it should prove to be possible.

"If this is the voice of the majority of the Gens," snapped Dalis, "given thus by their Spokesmen, then I vote with the majority! I shall call upon you immediately, Sarka, for a conference!"

"I am glad," said Sarka softly, "that the majority of the Spokesmen are with me. Especially am I glad that Dalis and Cleric vote with me. For the others I have

only this to say: I have thought this matter over for almost a century, and I know that the time has come when we must act, to save ourselves from self-destruction. Had you not decided with me, I should have acted alone!"

"Yes?" snapped Dalis. "How?"

"I have, here in my laboratory," replied Sarka, "the power whereby to accomplish the scheme of which I have told you! Had all the Gens defied me, I would have nevertheless sent the Earth outward on its voyage, bringing it within reach of the denizens, first of the Moon, second of Mars—and you people of little courage would have been compelled to fight to save yourselves!"

"You would have forced us into war?" came the quavering voice of Prull, the first Spokesman aside from Dalis to take active part in the discussion. "Then why, if you had the means in the beginning to enforce your will upon us, confer with us at all?"

Sarka thrilled with satisfaction, for this question gave

him the excuse he sought. He had been wondering and scheming how to compel the Spokesmen of the Gens to obey his will.

"I wanted your opinions," he said shortly. "But I also wish you to know that I have the power to go on, whether you wish it or not—*and you must obey me!*"

How would the twelve Gens take this ultimatum of Sarka? For breathless moments after he had spoken he waited, and the Spokesmen with him. Then came the voice of Cleric, addressing his people, yet leaving the contacts open so that Sarka and the other Spokesmen might hear.

"What say you, O Gens of Cleric?" he cried, his voice an exultant, clarioning paeon of rejoicing. "Do we follow this man who promises us life again? Do we follow this man who promises us that once again we shall dwell in plenty, without the blood of relatives and neighbors on our hands? Answer this man, O Gens—for I say unto you that wheresoever he leads I would follow him!"

Silence for a heartbeat. Then a murmuring like the sound of the waves of the long-vanished seas sounded in the laboratory, wherein all things were seen, all sounds were heard. A monster voice, loud and savage, from the Gens of Cleric.

"We follow Cleric wherever he leads!" Finally the words became intelligible. "It matters not to us whom Cleric follows, so long as we may follow Cleric!"

"Well spoken, O Gens of Cleric!" snapped Sarka when the murmuring died down to a whisper, then faded out entirely. "Deck yourselves in the white garments of Cleric! Emblazon upon your backs and breast the Red Lily of his House! Prepare for war! These are your orders; the details I leave to Cleric!"

There came the voice Dalis.

"Give your orders to my Gens direct, O Sarka!" rasped Dalis. "For I leave this very moment to come to you!"

"Thank you," said Sarka, a great wave of exaltation sweeping over him. He had expected Dalis to be the

last and most difficult to manage. Then to the Gens of Dalis, as the blue light on the table in the laboratory showed Sarka that Dalis was already winging toward him: "Deck yourselves in the green garments of Dalis! Wear as your insignia the yellow star of his House, and prepare for war! Make new and modern Ray Directors! Refurbish your rotting machines of destruction! Make ready, and make haste! For the Gens of Dalis will be the first of all the Gens to move in attack against the Dwellers Outside! When the time comes I shall tell you where you shall dwell—if you win the land I shall show you!"

The humming of myriad voices inside the laboratory was now almost continuous, but ever the words of Sarka went out to the Spokesmen and to the Gens, though, save in the case of Cleric and of Dalis, he did not speak to the Gens direct, because he did not wish in one iota to usurp the authority of the Spokesmen themselves.

But when less than an hour had passed, he realized that the first step had been successfully taken, and that from now on the success or failure of the scheme

rested in his own hands. Perspiration bedewed his forehead, and for a second he prayed.

"God of our fathers! Grant that we be not mistaken! Grant that we be right in what we plan! Grant that success attend our arms! Grant that this scheme of mine lead us not to catastrophe—for if this should develop, only I am guilty, and only I should be punished!"

"Amen!"

As one voice, the Spokesmen of the Gens spoke the word, and Sarka heard it. He had forgotten for the moment that the Spokesmen still could hear him.

"That is all," he said huskily. "Prepare your Gens, each of you, for such battle as even our histories never have recorded! For we go against foemen whose strength we do not know, whose manner of life we do not know, and we must not fail! Make haste with your preparations! Your time is short! And Spokesmen, counsel your Gens that they put aside at once all personal differences, all family quarrels, all quarrels

with their neighbors! That each adult individual, each unmarried woman, and such married woman as have all their children grown, and who no longer need them, prepare to go forth to battle! From this laboratory, within a brief space, Dalis and the Sarkas will give you further word!"

Then he dimmed the lights, and severed contact with the Spokesmen of the Gens. Only two lights he did not dim, at the moment, and to two men he spoke softly.

"My father and my father's father! Come to me at once! For there shall be need of the combined genius of the Sarkas if my scheme is to succeed!"

From both Sarkas, as though they had rehearsed the words against this need of them, came answer:

"Aye, son, we come!"

From that moment on until Dalis and the Sarkas were ready to take the most momentous step ever taken in the history of the world, the humming within the laboratory did not cease. For the people, the millions

and billions of people of the hives, were busy, eagerly and feverishly busy, preparing new armament, new engines of destruction, against the time when there should be need of them. And for perhaps the first time in centuries, the people were happy.

For not even the passage of a thousand centuries, or a thousand thousand centuries, could flush from the warm hearts of men the love of conflict!

Sarka smiled wanly, his face very pale. He had spoken, his people were busy with preparations, and now there could be no turning back. The world, when he spoke the word, would rush outward to glorious conflict—or to destruction!

A buzzer sounded near the Exit Dome. Sarka raced to give the "Enter" Signal—and Dalis, he of the hawk-eyes, the sharp nose and sharper tongue, entered the presence of the man who, in a twinkling, had made himself master of the world.

"Well," he said harshly, "I am here! What do you wish of me?"

"We Sarkas," said Sarka easily, "wish to assure ourselves that you will do nothing to obstruct our plans! Dalis, of the Gens of Dalis, you are prisoner of the Sarkas until you have passed your word!"

"That I will never do!" said Dalis calmly. "I have passed my word to go forward with you; but I meant, and you knew I meant, to go forward only as far as to me seemed right and reasonable!"

Chapter 5: *The Betrayal of Dalis*

And until the arrival of the other two Sarkas, Dalis said nothing. His face flushed an angry red as Sarka the First received the "Enter" Signal and stepped into the laboratory which had once been his—which he had delivered into the capable hands of Sarka the Second, in order to find new channels for his genius, as a worker for the betterment of the world's people. This he had found in organization, so that the people worked and labored, despite their personal quarrels, in closer harmony than they ever had before. But now Sarka the Third had called, and the two Sarkas responded. Dalis snarled at his ancient enemy, who looked to be the image of Sarka the Third and not one whit older, though one had preceded the other into the world by many centuries.

"Still the pleasant, congenial Dalis, I see!" smiled Sarka the First.

For the moment it seemed that Dalis would die there of his seething anger; but he answered no word for all of a minute. Then:

"This mad grandson of yours has made me a prisoner, until such time as I concur in all his plans!"

"If he says you are a prisoner, that you are!" snapped the elder Sarka angrily. "Son, what is this thing you plan?"

"For almost a century," replied Sarka, "I have been planning this. I knew, when father told me that Dalis had sworn he was able to halt for a moment the headlong flight of the Earth in its orbit, that Dalis did not lie or bluff! In your day, even, that was possible, and I continued with the knotty problem until I deduced the manner of its doing. I, too, can halt the Earth's rotation, or throw it out of its orbit! I took your idea, Dalis, *independently* of you, knowing you would never reveal your secret to a Sarka, and amplified it until I can not only halt the Earth in its orbit, but throw it out of its orbit entirely!"

For a moment Sarka studied the angry face of Dalis, and his own was very thoughtful.

"Dalis," he said at last, "I wish you were not our

enemy! For you are a genius, and the world has need of all the knowledge of such genius as it possesses. Why do you oppose us?"

"Because," snarled Dalis, "I guessed something of your plan that I do not like! I do not like the Sarkas, never have; but neither have the Sarkas any love for me! When you spoke to us all, I knew that somehow you had discovered the secret! You spoke, when you delivered your ultimatum, of attacking the Moon, and after it Mars! You also granted to my Gens what would have seemed a great honor—to anyone who did not fathom the tricky scheming of the Sarkas!—that of being the first into the fray! If we are to be first, and the Moon is to be the first attacked, then you plan to relieve the world forever of me, your arch-enemy, by exiling me and all my Gens upon the Moon! A dead world, covered with ashes, whose people dwell in dank caverns, like gnomes of the underworld...."

"Stay!" snapped Sarka. "But I granted you a greater honor even than that, Dalis! I planned on your Gens, led by you, making a successful conquest of the Moon—because only such a genius as Dalis could force

from this dead world a living for his Gens! Because you are the wisest of the Spokesmen, I planned for you the greatest task! Because I need you ... I do not slay you!"

"I thank you," bowing low, with the deepest sarcasm, "but you honor me too much! And tell me, pray, if it is not true that you plan for the Sarkas their choice of the best and newest worlds of the Universe?"

Sarka did not answer for a second, while his sensitive nostrils quivered with fury. The Sarkas had not noticed, but Jaska, daughter of Cleric, had admitted herself through the Exit Dome, in a way known only to Sarka and to herself, as she had entered many times before so as not to disturb Sarka at his labors. She now stood silently there, divesting herself of her Belt and outer clothing, beneath which was the golden toga worn by all the women of the earth. Dalis, however, had seen her, and his eyes narrowed craftily as he awaited the answer of Sarka.

"Dalis," said Sarka softly, "it is not for you to question me, but to obey me! I have not undertaken this step

without mastering all its details, and I refuse to allow you to swerve me in a single one of them from my plan."

Dalis straightened, standing stiffly at savage attention, and met the angry eyes of Sarka without flinching. There was no fear in Dalis, as all the world knew. But he was a schemer, and selfish.

"After all," he said, "I have known Sarkas to make promises they could not keep! How do I know, how does the world know, that you can do what you say you can do?"

"If," said Sarka, "I close all contact of this laboratory with the world outside, so that none may hear what I say save we four, and I then whisper here the secret you never told, Dalis, when my father's father refused to help you—will you then believe?"

The face of Dalis went suddenly white, but he nodded, his eyes burning redly. Jaska moved closer to the men, who stood near the table of the vari-colored lights.

"You needed my father's father," said Sarka softly, "because the secret of your scheme rested here in this laboratory, which is the highest point in the world! You pretended to need him in your scheme; but you did not need my father's father, though you *did* need his laboratory, and some of the facts of science that *he* discovered. So you came to him with your scheme, discovered that he believed, though he denied it, your scheme was possible—because he refused to aid you in it! Then, as an excuse to re-enter this laboratory, you told him you would return within two days! Now, shall I tell you your secret?"

The lips of Dalis were moving soundlessly. His right hand started to rise, as though he would make it signal the negative he was unable for a moment to speak. But even as he stood there, swaying slightly on his feet, Sarka dashed to the lights on the table, disconnecting them one by one; to the Revolving Beryl, which then ceased to revolve for the first time in centuries—whirled when he had finished, and stepped to the very center of the room.

"Now," he whispered, "your secret, Dalis!"

Still the hand upraised, still Dalis tried to speak, and could not.

Sarka spoke, in a hoarse, almost terrified whisper, four words:

"The Beryl! The Ovoids!"

Gasps of surprise from the other two Sarkas, whose eyes for a second flashed to the huge Beryl, which now was still, silent—and blind. Dawning comprehension was evident in their faces.

"The success of the Revolving Beryl," whispered Sarka, "which sees all that transpires in this world, depends on one fact: that its revolving is proportionately timed to infinite exactness with the revolution of the Earth about its axis! This Beryl is the Master Beryl of the Earth, which was why Dalis needed this Beryl, and could use no other!"

"Suppose that for a period of two days, uniformly progressive, this Beryl were forced to revolve in sharp jerks at an increasing rate of speed! With all

connections in place, and all the world's Beryls attuned to the speed of this one—what would happen? What would happen if a single Gens were marshalled in warlike array atop the area of the Gens, and kept up a steady, rhythmic march for a period of hours?"

"In a few hours," whispered Sarka the First, "the roof of the Gens area would begin to vibrate, to vibrate throughout all the area, and even into all surrounding Gens areas—and in time the roof would collapse!"

"Exactly!" said Sarka, breathing heavily. "This Beryl, when attuned to all other Beryls in the world, would have this vibratory effect, not only on a certain area of the world—but upon the entire world!—Force the speed of the Beryls to the uttermost limit, and you sway the world to your will! As a marching horde would sway the roof of a vast section of the world if the horde's commander willed!

"But that is not enough! The world would tremble, but nothing more! The Earth's store of Ovidum, which is Anti-Gravitational, and used in minute quantities in our Anti-Gravitational Ovoids, is evenly distributed

throughout the world. By vibration of the Beryls I can control it, scatter it or gather it all together wherever I will! By shifting through vibration this Anti-Gravitational material, I can disrupt, make uneven, or nullify the pull of gravity on the Earth!"

"That would do it," said Dalis, finding his voice at last; "but how would you control the course the Earth would take, thus thrown out of its orbit?"

"That, my dear Dalis, is for the moment my secret!"

"But is it?" Dalis suddenly shouted.

Before the three Sarkas could recover from their surprise at the man's sudden vehemence, he made a swift, terrifying move. He leaped away from them to stand beside Jaska, daughter of Cleric.

"Sarka," he shrieked, "I know you love this woman! Note this little tube I hold against her side. With it I can cause her to vanish for all time, merely by a slight pressure of the fingers! And that will I do, unless you immediately open all contacts with the world and

remain silent while I tell the people of Earth how you would betray them!"

The three Sarkas were petrified with amazement and horror, for they recognized the slender tube in the hand of Dalis as a Ray Director, the world's greatest engine of destruction, and knew that it would do exactly as Dalis had said it would.

Automatically, because they were brave men, they had stepped a trifle closer to Jaska and Dalis. Perspiration poured from their cheeks as they stared at this rebel. But their fears were for Jaska, who now spoke for the first time.

"Let him do as he wills," she said smilingly, "since for the good of the world I do not fear to die! Refuse him, Sarka, and know that I go into Death's Darkness loving you always, and knowing that you will succeed in the end, in spite of the opposition of men like Dalis!"

A man of unexpected actions, this Dalis, for while the attentions of the Sarkas were on the little tableau he

had staged, his eyes had darted to the Beryl, to the control which Sarka had touched to still its revolving. Now he sprang away from Jaska, was free of her and the Sarkas before any could move to intercept him.

He dashed to the Beryl. Instantly it swept into motion, while Dalis whirled to face the Sarkas, and from his lips came a burst of triumphant laughter. One hand was on the Beryl Control, the other still held the Ray Director.

"Fools!" he cried. "Fools! Duped like children! And now it is Dalis who is master of the world! Move closer to me, and I will turn my Ray Director upon this Beryl, which you have so kindly informed me is master of all the Beryls and of all Ovidum deposits! Be glad that I do not turn it upon you; but for you I have a kinder, more honorable fate! I now am master, and will direct the destiny of the world! But I will never leave it, because I suspect that it is the most pleasant of all the worlds! I will, however, choose for the Sarkas a world that shall be the dreariest in all the Universe!"

The Sarkas whirled as soft laughter came from Jaska, daughter of Cleric. Strange, lilting laughter. They turned in time to see her vanish through the Exit Dome; but for a long moment her jeering laughter seemed to sound in the laboratory she had left-and, to judge by her laughter, had betrayed! For Dalis, arch-traitor, echoed her laughter!

Chapter 6: *The Beryls in Tune*

"Remember," said Dalis, as the Beryl began to revolve and its humming mounted moment by moment to normal, "that you must concur in whatever I say to the people of the Earth—for if you do not, I swear that I will destroy this Master Beryl! Then what happens to your scheme, Sarka the Third? You see, there is no change in the plans, save one: I am the master, not you!"

Dalis was not a madman, for the world conceded him place in its list of geniuses next below the three Sarkas, which was high honor indeed; but Dalis possessed in abundance that most universal of all human emotions—jealousy. For centuries he had been nursing it, watching the Sarkas always in the niches just above him, yet never being able to attain to their eminence. Now....

He had outwitted them. It might be for a moment only, but while his mastery lasted he would drink deeply of personal satisfaction. Now, however, there was no gloating in his face, for he realized, as Sarka

had realized, the infinite gravity of the whole situation. If a mistake were made, the world would plunge to destruction—or go cooling forever in a headlong race through space.

"I keep the Ray Director hidden," he whispered, while the murmuring of the Master Beryl mounted as it gained speed again, "but know you, Sarkas, that its muzzle points at the Master Beryl, always!"

Now the forms of Earth were appearing on the Beryl. Men in countless hordes were maneuvering in myriads, legions and armies, across the face of the globe. There was no marching, but an effortless, swift as light almost, aerial maneuvering. For each human being possessed the tight-fitting metalized cloth, with the gleaming helmet in whose skull-pan was the Anti-Gravitational Ovoid, which was the "outside" garment of earthlings. With the Ovoid sitting exactly against the skull, man had but to will himself in any direction, at any livable height, and the action took place. In the same way, one man, to whom others in an organization gave allegiance by appointment, could will all his underlings into whatever formation he

desired.

As beautiful and effortless at the flight of those birds which had vanished from the earth centuries before.

"Remember, Dalis," said Sarka, "that while the speed of the Earth in its orbit is between eighteen and nineteen miles per second, once thrown out of its orbit, and forced to follow a straight or nearly straight line, the speed may be many times that-or much less!"

"The simplest facts of science," snarled Dalis, "were known to me a thousand years before you were born! Now I shall tell the Spokesmen of the Gens, and be sure that you second what I say!"

He paused. Then, raising his voice impressively, he spoke.

"O Spokesmen of the Gens, O Gens of Earth, hark ye to the words of Dalis and of Sarka! The time has come to try the experiment of which Sarka told you, and which I, Dalis, of the Gens of Dalis, have found good, and hereby certify! See that all your Beryls are

mathematically tuned to catch every sound, every vibration, every picture, from this Beryl of Sarka, henceforth to be known as the Master Beryl!

"No matter what happens, no matter what changes take place in the temperature of your homes, no matter what storms may come, touch not your Beryls until instructed from this laboratory! Tune your Beryls, then leave them, and hasten faster with your preparations for war! Each Spokesman of a Gens will at once instruct the members of his Gens that all partitions between families shall immediately be removed, outward from a common center in each case, until one hundred families occupy a single dwelling place. Materials from destroyed partitions shall be carefully hoarded, and the newer and bigger areas shall become maneuvering places for the hundred families which will occupy each given area!

"Facing a crisis as we are, no thought can be given to privacy, and neighborly quarrels must be forgotten! This move is necessary because no single dwelling place is large enough to be used as a place of maneuver—and from now on until the command is

given, maneuvers must not be held Outside! For hark ye, O Spokesmen, O Gens of Earth, we are about to start upon our voyage into outer space! Spokesmen, call in your maneuvering myriads! You have five minutes!"

In five minutes not a flying man could be seen in all the cold, stormy outside. Dalis spoke again.

"Tune your Beryls and remove partitions, taking care that in reducing partitions you so estimate your stresses and strains that the roof of the world be not endangered by weight that is unsupported, or improperly supported!

"Food Conservers, redouble your production and rush your transportation of Food Capsules!

"Mothers of men, take over the labors of your sons and your husbands! Sisters and sweethearts of men, join the myriads in maneuvers, for you, too, may require knowledge of fighting!"

In spite of himself, an ejaculation of admiration

escaped the lips of Sarka. Hearing it, Dalis turned to him, and a flush of pleasure tinged his cheeks as Sarka shaped one word with his lips:

"Excellent!"

Then, after a pause, Sarka spoke directly to the Gens of Earth.

"Take heed of the words of Dalis, for they are also the words of the Sarkas!"

Then an expression of surprise flashed across the face of Sarka as Dalis' fingers began to move in a swift sort of pantomime—for the sign manual he used was the secret manual of Jaska and Sarka! His heart cold within him at this new proof of her betrayal, Sarka nevertheless noted the words which dropped silently off the fingers of this enemy of the Sarkas.

"You are wise to resist no further! Together we can do much, and if you give your word not to oppose me, we can work together; but I will be the master!"

"But, if we grant you the mastery, will you heed our advice if it is good?"

"I will, but I alone will be the judge of its worth!"

"Then we work together henceforth. Let us begin! In the time required to move from here to the Moon, our people will have ample opportunity to perfect themselves in maneuvers! Are you ready, O my father, and father's father?"

"Ready!" they said together.

But for a moment Dalis hesitated. "Your word!" he snapped, looking at each Sarka in turn, and each in his turn nodded. They had given their word, but not their love, to Dalis. Dalis bowed low to Sarka the Youngest, who darted to the onyx base in which revolved the Master Beryl, and pressed a small lever of metalized jade, set in a slot on the southern side of the base of onyx. The humming sound within the Beryl became perceptibly louder, and as the minutes passed, and Sarka stood, arms folded, watching the Revolving Beryl, it continued to increase.

Here was the crisis, and as they watched its sure, certain approach, they forgot their enmities, Dalis and the Sarkas, and watched the whirling Beryl. Minute by minute its humming increased. The figures still were plain to be seen within the Beryl, but were becoming blurred of outline. Partitions had been removed all over the earth, increasing the size of rooms a hundredfold, reducing their number a hundredfold. The Gens of Earth, by hundred-families, were maneuvering under the Heads of Hundreds. The depths of the Master Beryl, therefore, was a maze of flying men, with their extremities slightly blurred, and becoming more so as the Master Beryl increased its speed.

Here now was shown the value of the organization fostered by Sarka the First—for in all the world there was no single Beryl out of tune with the Master Beryl; and as the Master Beryl increased the speed of its revolving, so increased at the same time the speed of all the other Beryls. Minute by minute the humming of the Master, and with it the others, increased in volume.

"Father!" spoke Sarka. "To the Observatory, behind the Beryl, please, to watch the stars, and from them to note the direction we take when the combined vibrations of the Beryls have affected the quiescence of Earth's deposits of Ovidum and, through its shifting, disturbed the flight of the Earth in its orbit!"

With a brief nod Sarka's father hurried around the Master Beryl to the tiny Observatory beyond, from which, through the Micro-Telescopes, those who knew could read the secrets of the planets, the stars—the Universe. Sarka watched him go, wondering if Dalis might not forbid him. But Dalis merely watched him go and said nothing.

Now that the time of Change was upon the world, Dalis realized his responsibility. It was little wonder that he began to be for the first time a little bit afraid.

"Note, Dalis!" snapped Sarka, and Dalis started nervously as his name was spoken. "Feel the trembling of the laboratory, just as the same trembling affects all the other buildings in the world in which Beryls are located. As the minutes pass the

trembling will go deeper and deeper, and by tomorrow the first tremors will be reaching into the Earth to several miles below the last habitable Inner Level! And then....

"Then," repeated Sarka tersely, "my father will know by his study of the stars in which new direction we are traveling! For within twenty-four hours the Earth will have started on its voyage of conquest!"

"Is there no way, Sarka," queried Dalis, "by which we can control the direction of our flight!"

"There *is* a way, O wise and gallant Dalis! But since you do not know it, who now is master?"

Dalis' face became as pale as chalk, and Sarka smiled a little as he watched him. Then, wondering what new resolve stirred the depths of this master egotist of the earth, he watched emotions flash to and fro across the face of Dalis, watched the color return to his cheeks. The cold of death gripped at his heart when Dalis spoke.

"I do not fear death, O wise and gallant Sarka!" he mocked. "For I have lived fully and well, and for many, many centuries! You know that I do not fear to slay people of the Earth, for did I not propose to your father's father that a flood would be beneficial to unfit earthlings? Hear, then! Keep your secret, and I shall allow the Earth to go outward into space, out of control, in whatever direction it will. If any other worlds happen to lie in our pathway...."

Dalis shrugged indifferently, turning his back on Sarka, to peer again into the depths of the Master Beryl, whose voice had risen to a vaster murmur, whose pictures were becoming moment by moment more blurred as time fled irrevocably into eternity.

Sarka the First took advantage of his opportunity, and leaped at the back of Dalis, hands extended to fasten them in the throat of his ancient enemy. Dalis whirled, with a burst of laughter, and the muzzle of his Ray Director covered the person of the First Sarka. In a flash the spot where Sarka the First had been was vacant, and there was no single sign to show that he had ever stood there!

Silence then in the laboratory, save for the mounting
murmur of the Master Beryl!

Chapter 7: *Outer Space*

"He only proved a belief I have entertained for centuries!" snarled Dalis. "That all the male Sarkas are fools—and the females for bearing them!"

Sarka said nothing, but within his breast a deep hatred was forming for Dalis. He had disliked him before, and had been amused by him; but in the busy life of Sarka there had been no time for hatred of anyone. Busy people had no time for hatreds.

"You should be torn to pieces for that, Dalis!" was all he said. "We needed my father's father in our efforts! But the loss to the world of one super-genius cannot be balanced by slaying another—so you are safe!"

"What he could do, I can do!" snapped Dalis.

Sarka turned away from him, seating himself beside the table of the vari-colored lights, and his heart was heavy as lead in his breast. He blamed Jaska for much of this, and his heart was burdened, despite her treachery, by the fact that he loved her, always would

love her. Love was the one possession which made centuries of life desirable to men of the Earth. For men could spend centuries in seeking a true mate, knowing that there were other centuries still in which to enjoy her. Woman was man's greatest boon, his excuse for living, as was man excuse for woman. Through the centuries, when humankind remained forever young, the joy in each other of those truly mated grew as their knowledge grew....

And now Jaska had failed Sarka, when for half a century they had loved each other! Why had she done it? He had given her no reason to do so. Had there been some other reason? Why had she laughed, and left them, after the betrayal of the Master Beryl into the hands of Dalis?

"Before God," whispered Sarka, "I believe that you, Jaska, were playing a game to dupe Dalis, as he played a game to dupe us!"

Down in his heart he was not sure. But somehow, just to whisper to himself his faith in Jaska, gave it back to him in some measure, and by so much lightened the

weight upon his heart. For now his responsibilities were greater than they had ever been before, and he had need of all his faculties.

"She'll come back, or somehow communicate with me, and explain everything," he told himself. But he refused to ponder on how Dalis the betrayer had gained possession of the secret sign manual he had believed known only to Jaska and himself. That, too, might be explained satisfactorily, for Dalis was cunning.

From the side of the laboratory opposite the Revolving Beryl came a soft tinkling sound, like the striking of a musical bell. Sarka rose wearily, strode to the wall, where a narrow aperture opened, in which rested Food Capsules sufficient for one meal for three men. He smiled wryly. They knew then, the Food Conservers deep in the earth as they were, that Sarka the First was no more—and sent food for three men! All the world knew, perhaps, yet no single person had raised voice in protest—or if any had, the mounting murmur of the Beryls had drowned it out.

"Sarka!" spoke Dalis suddenly. "At what time do you estimate that the flight of the Earth in its orbit will be materially affected?"

"It is being affected this moment, Dalis, shifting the Ovidum store!" said Sarka shortly. "Within twelve hours we will be in readiness to start our journey!"

Remaining absolutely motionless within the domed laboratory, it was now possible to feel the ever so slight motion, not only of the laboratory, but of the mountain crest upon which it rested. Not so much a to-and-fro motion as a round-about motion.

Just as the slightest sound flies outward through space endlessly, and the slightest vibration moves outward until the end of time and of space, Sarka knew that the vibration set up by the Beryl, slight though it was, was already being felt at the Poles of the Earth. Not enough to be noticed there, but existant, just the same.

"In twelve hours the world will be fighting against this combined vibration and Anti-Gravitational Force we

are starting, and second by second accelerating," Sarka explained to Dalis: "fighting to remain on its pathway about the Sun! But we will win against it, and with each new vibration, each succeeding one being more strongly felt, we will force the Earth that much more against the *pull* which holds it in its orbit!"

The laboratory was trembling. The mountain beneath it was trembling. Both in accordance with scientific design. There was no element of chance in it, for the mountain moved, and the laboratory on its crest moved, as science willed. It was now difficult for Sarka to remain still where he sat, for the trembling was exciting his heart action, and causing the blood to rush to his cheeks, making him feverish. He rose to his feet and began pacing the floor.

He strode to the jade lever, moved it ahead a fraction of a fraction of an inch, and perceptibly the murmuring of the Beryl increased, as did the trembling of the laboratory and of the mountain.

Twelve hours later exactly, Sarka shouted a single

word to Dalis.

"Now!"

The laboratory was swinging about in a sort of circle in a way that made one dizzy if one remained still for the merest second. Sarka, glancing out into the Outside, across which blew the storms of the heights, and noting that no cracks appeared in the surface of the world's vast roof, knew that this swaying motion had been transmitted evenly to all the Earth, and that, so far at least, his calculations had been correct.

But Dalis was in a cold sweat of fear, and deathly sick. The motion of the laboratory, like the inside of a whirling top, made him ill, though Sarka could tell that he fought against it with all his great will.

Sarka strode to him, looked him in the eyes for a moment. Dalis looked back, glaring defiance.

"Are you afraid, Dalis?" he shouted, to be heard above the screaming of the Master Beryl.

"I am not afraid," croaked Dalis. "Has the time arrived?"

Sarka paused, as though for dramatic effect, and raised his right hand high, while his left hand dropped to the metalized jade lever. There still was room in the slot in the onyx base for the lever to move forward ever so little.

"We have reached the exact place," cried Sarka, "where the Earth can, by pressure upon this lever, be continued on in its orbit—or forced out of it—out into space! Which shall it be, Dalis? If I move the lever forward we start our voyage, and may not be able to return!"

For a moment the nostrils of Dalis quivered as though with fear. His face was white with his illness; but out of his eyes peered the fanatic self-confidence of the man.

"Push it forward, O Sarka!" he managed.

Sarka, smiling slightly, pushed the lever to its

uttermost limit, still with his right arm upraised. For full five minutes he stood thus, and then....

"Now!" he shouted, bringing down his arm. "We have begun our journey into space! Come, let us look Outside, and await the first reports from my father!"

The two men, forgetting again for a moment the fact of their enmity, strode to the southern wall of the laboratory and looked out across the roof of the world.

"You will note, Dalis," said Sarka conversationally, "that in a matter of hours, the roaring of the Etheric winds will possess everything! We will have passed into the infinite reaches of Outer Space, where, if I may make so bold as to say so, it were better if Dalis, self-named master of the world, knew whither he was going!"

Chapter 8: *Moon Minions Prepare*

"It is time," said Sarka softly, "that we who have urged the world to forget its quarrels should forget our own. What difference who is master, so long as success attend our efforts?"

"Then tell me your secret of control of our flight!" snapped Dalis.

Before Sarka could answer, however, Sarka the Second entered the laboratory area before the Master Beryl. He looked a question at his son, and Sarka knew that his father was asking what had become of Sarka the First. He shrugged his shoulders, and nodded his head toward Dalis. Sarka the Second gave no more sign of perturbation than had his son, but deep within his eyes were signal fires of fury which centuries of penance on the part of Dalis would not erase. But now, with Sarka the First gone, Dalis must live.

"We are headed," said Sarka's father softly, "in the general direction of the Moon! If we could travel

toward it in a straight line, we would reach it, if we kept our pace of about eighteen miles per second, in approximately four hours! But since we are out of control, I fear we will pass it too far away for our fighters to fly across the intervening space! Or we may be drawn against it, in planetary collision, which of course means annihilation. We are traveling noticeably faster than while in the earth's orbit. I am able to see something of the preparation of Moon-men to receive us!"

Dalis turned to Sarka, and the perspiration bedewed his forehead. In order to make this mad mission successful, he must know Sarka's secret of control. Had he been in Sarka's place, *he* would have kept his secret, no matter what happened, and he believed in his heart that Sarka would do the same. It never occurred to him that Sarka, no matter who the master, would divulge his secret in order to save humanity from destruction.

"We have approximately four hours, Dalis!" Sarka prompted the betrayer. "I need at least an hour for my experiments! Do you, knowing as you do that I have

planned all this out, know exactly what course our voyage should take, still insist on holding the reins yourself?"

"I agree, for this time, to listen to your advice, as I promised you!"

"Then let me suggest that you do some of the work which I had planned should be done by my father's father! It is time that the world's Induction Conduits be placed in operation, in order that our people be supplied with equable temperature from the Earth's Core, as our temperature changes due to our position with relation to the sun! Stand back and give me the controls!"

For a moment Dalis stared at the two Sarkas. Would they seize power the moment he moved away from the Beryl Control? In their places he knew he would have done it. In their places he knew he would never have submerged self in the good of the people. But, somewhat diffidently, he moved away. Sarka the Second returned to the Observatory, behind the Beryl, while Sarka stopped before the table where the lights

were.

After a moment of thought-conversation with Sarka the Second in the Observatory, he dimmed the light which connected his laboratory with the headquarters of Klaser, in the Americas.

"Klaser," he barked, "for the period of one second cut the speed of every Beryl within your Gens to half its present speed!"

"I obey, O Sarka!" came the voice of Klaser.

::Have we changed direction?:: Sarka mentally questioned his father.

::Slightly, but we are curving away, instead of toward the Moon! Try again!::

Sarka dimmed the light of Cleric, who instantly made answer.

"I am here, Sarka!"

"Stop the Beryls of your Gens for two seconds, but be prepared to speed them up immediately afterward, if ordered, to the speed at which they are now revolving! Klaser, hold the speed of your Beryls as they are!"

"I obey, O Sarka!" came the musical tones of Cleric.

"I hear, O Sarka!" replied Klaser.

::Now, my father,:: queried Sarka again, telepathically,
::what direction do we travel?::

::We are heading in a direction which will cause us to pass the Moon at a distance of approximately fifty thousand miles!::

"From which point our fighters can reach the Moon in exactly two hours, after they have passed through our atmosphere!" cried Sarka exultantly, aloud.

::True, son!:: replied Sarka the Second, mentally. ::I suggest you hold our course steady as it is!::

The motion of the earth now was as that of a steadily falling body, and the shifting of the Ovidum store caused by vibrations set up by the Beryls had set the Earth on its course toward the Moon. Sarka now gave instructions to Klaser and to Cleric to return the speed of the Beryls to that which they had attained at the moment the journey of the Earth had begun—thus bringing them once more into harmony with the Master Beryl, and rendering the Ovidum static.

Dalis re-entered the laboratory from the Wall Tube, near the Dome Exit, by which he had passed down to the lowest Inner Level, and stared suspiciously at the two Sarkas. He found them half-smiling their satisfaction.

"We pass the Moon within fifty thousand miles!" exulted Sarka. "A flight of two hours for the Gens which attacks the Moon! Do you refuse, O Dalis, to send your Gens against the Moon?"

"Why not send the Gens of Gerd!" demanded Dalis. "He is the youngest of the Spokesmen, and what better test is there for him than this?"

"It is because he is so young that we do not wish to send him," replied Sarka coldly. "The colonization of the Moon by Earthlings requires the guiding genius of a Spokesman who has the experience of a Dalis—or a Sarka, else you would now be dead!"

"Then let it be a Sarka!" barked Dalis.

"Who, then, will control the further flight of the Earth?"

"You! Let your father lead my Gens against the Moon!"

"What will your Gens say, O Dalis? That their revered Spokesman feared to lead them in person?"

"Enough of this squabbling," snapped Sarka the Second. "Do you not realize that within a matter of hours, some Gens must be sent into battle? Come with me to the Observatory, where you will be given something beside squabbling with which to occupy your minds!"

Leaving the earth on its lonely flight through space, the three men hurried to the Observatory, where they seated themselves before the eye-pieces of the Micro-Telescopes, whose outer circles had been aimed at the Moon.

For a moment the three stared breathlessly at the surface of this dead sister of the Earth. They noted her valleys, her craters which seemed bottomless, and saw that even as they watched, valleys and craters became sharper of outline, proving that they were approaching the Moon at a tremendous speed. It seemed, too, as though they were heading toward sure collision, though Sarka the Second had said that they would pass the Moon at a distance of fifty thousand miles.

"You will note activity at the very rims of the craters!" said the Elder Sarka easily. "The craters are man-made, not volcanic, as some scientists believe, and are shaped to converge the rays of the sun, as our roof is created for the same purpose. But note the activity at the rims of the craters!"

Closer the men peered, studying the rims as instructed by Sarka the Second. All about them—and as they watched, activity became apparent on the inner slopes of the craters—winged creatures seemed to be flying. They looked like tiny oblate spheroids, and they were in swift action, darting to and fro like bees which have been disturbed in their hives.

"Those spheres are of metal," said Sarka the Second, "and they are the fighting Aircars of the Moon-men!"

Neither Dalis nor Sarka denied this statement, for they knew it to be fact. It became apparent that the movement of the Aircars was not a movement of chance, but as skillfully ordered as any maneuvers which had, during the last few hours, been executed by any of the Gens of Earth. That they were of metal became apparent when, through the Micro-Telescopes, the watchers caught the glint of the sun on the surfaces of the cars.

Sarka did a swift mental calculation, and announced the result.

"Those Aircars average something like four hundred feet in length, and are doubtless filled with fighting Moon-men!"

"That's right," said Dalis, who also had been calculating this very thing, "but our Ray Directors will disintegrate the Aircars as easily as my Ray Director disintegrated Sarka the First!"

"The remaining Sarkas received this statement in silence, for Dalis' choice of a comparison had been an unhappy one, to say the least.

"I am wondering," said Sarka, "if you, my father, and you Dalis, have noted the peculiar appendages of the Aircars?"

"I saw them some minutes ago," said his father moodily, "and I am almost afraid to guess their use! If they are what I fear they are, then the Moon-men have been expecting this attack of ours for years and years, and have been preparing for it! If they have known, and have been preparing, then we are facing a race of super-Beings indeed—for we have known

but little of their activities!"

"What, then," said Dalis, "do you think is the purpose of those appendages?"

"Those appendages, cilia, flagella, call them whatever you wish, are man-made tentacles, created for the purpose of seizing, crushing and destroying—then discarding...."

For a full two minutes the three men sat there, and horrible doubts flooded their brains. For the conclusion was obvious. The Gens of Earth would go into action flying, not as organizations, inside an Aircar, but as individuals, in swarms, myriads, legions and hordes. In order to do the utmost damage with their Ray Directors and Atom Disintegrators, they must approach within a reasonable distance—and the picture of those mighty tentacles, hurled like leashed lightning bolts into the midst of the attackers, folding in individuals by scores and hundreds, crushing them and dropping them contemptuously, was horrible in the extreme to contemplate!

It was difficult to estimate the possible speed of the Aircars of the Moon-men, at least at this distance. Besides, perhaps not a single one of them was traveling at top speed, because of the fact of their crowded traffic.

This thought passed through the minds of the three men.

"But we'll know," said Sarka dully, "when they get into action. For if I am not mistaken, those Aircars are being mustered on the rims of those craters to await orders, not to resist our attack, but to launch their own attack before we are ready! Dalis, are you going to allow your Gens to go into action against these Outsiders, without the inspiration of your personal leadership?"

The nostrils of Dalis were quivering with the intensity of his emotion. His vast egotism told him that he, Dalis, could successfully combat these Aircars of the Moon-men, and he wished with all his heart to issue the orders to his Gens. But, vain as he was, he did not even wish to have the appearance of acceding to the

original plan of Sarka! Sarka had planned for Dalis to attack the dwellers of the Moon, and Dalis had refused. Now, when this challenge of the Aircars was a direct challenge to his genius as a potential warlord of earth and he wished to accept the challenge, he was torn two ways.

Should he go ahead under the common leadership of the Sarkas? Or should he still refuse battle—and perhaps see some lesser Spokesman go forth to win glory and imperishable renown to himself?

A thought message, a command almost, impinged on the brains of the three.

"I wish to speak with you aloud!:: The message was from Jaska!

The three men rose and darted into the room of the Master Beryl. They had no sooner entered than the clear voice of Jaska sounded in the laboratory.

"Sarka, I am no traitor! I am Jaska, who loves you! I am in the headquarters of Dalis at Ohi, and the Gens

of Dalis has indicated its allegiance to me, having been informed by me that it is the wish of Dalis, whose presence is needed at the place of the Master Beryl! Command us, O Sarka, for we are ready to attack!"

There the voice ended, while the two Sarkas turned again to face Dalis.

Sarka now was glad that Dalis knew the secret sign manual, and his fingers worked swiftly as he spoke to the rebel.

[Will you, then, Dalis, allow your Gens to be led to glory by a woman? A woman, moreover, who has duped you?]

"The woman is a fool!" said Dalis. "She will lead the Gens to destruction!"

"Who, then, will be blamed if she does? Your Gens believe she is their new Spokesman at your wish! If they are told otherwise, they will think that Dalis himself is afraid to lead them!"

"We shall see," said Dalis, "if I could win honor by leading my Gens in a successful attack against the Moon-men, how much greater will be my glory if Jaska attacks, is repulsed—and I go in to turn defeat into victory!"

Thus spake the colossal selfishness of Dalis, who took no thought of the possible, nay, certain, loss of countless lives because of his obstinancy.

"I suggest," he said, "that you instruct your beloved Jaska to make ready; for if I am not mistaken, when we return to the Observatory we will discover that the Aircars of the Moon-men have left their craters and are racing outward from the Moon to meet us! Or perhaps you would lead my Gens, to safeguard Jaska!"

Chapter 9: *The Attack of the Yellow Stars*

"Why should I safeguard Jaska?" asked Sarka quietly. "She is a true daughter of Cleric! If Cleric does not fear for her to be Spokesman of a Gens, why should I? He is her father. If she wins, the more glory will be hers! If she loses, she will at least have tried!"

"Meaning," snarled Dalis, "that I have refused even to try!"

Sarka shrugged expressively, and the three stepped once more into the Observatory, took their places before the Micro-Telescopes. For a moment they could not see the outline of the Moon, for during their brief sojourn in the laboratory the Moon seemed to have disintegrated, flying into countless spheroidal pieces.

"You see?" said Dalis. "The Moon-men do not wait for us! They attack!"

It was all too true that the Aircars which had been mustered at the rims of the Moon's craters had been hurled outward into space, outward toward the on-

rushing Earth, and the myriad numbers of them for a time shut out all view of the surface of the Moon.

"God!" spoke Sarka, and it was like a prayer. His cheeks were pale as death, for in a moment he would speak the word which would send the Gens of Dalis, under the leadership of Jaska, out against these formidable Aircars of the Moon-men, and the appearance of the on-rushing cars was terrifying. That their flying radius, outward, was a great one, was manifest by the fact that the Earth would not for another hour reach its closest estimated point with the Moon.

Sarka, exchanging glances with his father, rose and stepped again into the laboratory. Even as he entered the room of the Master Beryl, Jaska's broken signal came through.

"I am ready, Sarka!" came her soft voice, vibrant with confidence. "The Gens is ready, and the Gens believes in me!"

For a moment Sarka hesitated before taking the

plunge. Then he spoke the fatal words.

"Go, Jaska, and my love goes with you!"

As the Earth approached closer to the Moon, the revolving of the Beryls had been decreased, so that the motion of the Master Beryl was almost normal—normal being that speed with which it revolved when it was necessary to use it for visual contact with the people of the Earth.

Out of the area of the Gens of Dalis darted the green specks which were the flying people of Dalis! Sarka, staring in among them, focussing the Beryl-microscope, sought for some way of identifying Jaska, who led them. A thrill coursed through him when he made her out, unmistakably—dressed still in the tight white clothing of her own Gens, with the Red Lily of the house of Cleric on her breast and on her back! The daughter of Cleric was leading the Gens of Dalis into combat under her own colors and her father's insignia!

Sarka raced back to the Observatory, seated himself

again to watch the attack, which must of necessity be joined within a matter almost of minutes. Those myriads of Aircars flying outward from the Moon, had seemed invincible; but up until now he had never seen an entire Gens mustered at one time. His whole being thrilled with the awesome grandeur of the spectacle; it seemed that not an able-bodied individual of the Gens of Dalis had failed to answer the muster of the Gens.

Millions upon millions of people, taking off the icy roof of that part of the Earth lying between Ohi and the North Pole, from the heart of what had once been part of the Pacific Ocean.

So many of them were there that when they were free of the Earth, flashing outward at two thousand miles an hour, it was impossible to see the Moon or those formidable Aircars—and still, out of the heart of the area of the Gens of Dalis, came other myriads, each flight waiting only for the preceding flight to clear!

The green, tight fitting clothing of the Gens of Dalis, each individual wearing the yellow star of the

Spokesman of the Gens! A marvelous, awe-inspiring sight!

And this was but a single area, and the earth was divided into twelve such areas, some smaller, none larger, which showed Sarka for the first time a hint of the mighty man-power, and fighting woman-power which he controlled. However, once free of the Earth, conduct of the fight would be in the hands of the Spokesman—Jaska, acting for Dalis.

Sarka turned to Dalis, his eyes flashing.

"Does it not thrill you, O Dalis?" he demanded. "Do you not wish now that you had gone out with your people as their leader?"

"They follow Jaska like sheep," he stated with a snort. "But wait! My Gens seem invincible, because it bulks between us and the Aircars of the Moon-Dwellers! Wait, see how the battle goes! The Gens may yet have need of Dalis!"

Sarka studied those outgoing hosts, which were

dwindling away to mere specks with vast speed, for through the cordons and cordons of them he could now see the Aircars more plainly. It was still possible, when one looked through the Micro-Telescopes, to see the slim figure of Jaska leading the attack. She was in the vanguard of the Gens of Dalis leading her people onward as though she had been born to command—utterly fearless.

"And I was small enough," whispered Sarka, "to doubt you! I even told you that I doubted you! Forgive me, Jaska! Forgive me!"

And still, as Level after Level gave up its myriads, the Gens of Dalis shot forth from the Gens area, and winged away, following the lead of Jaska. Millions of people, armed with Ray Directors and Atom Disintegrators. How tiny the individuals seemed, against the mighty bulk of those Aircars of the Moon!

But Sarka did not fear, save for the safety of Jaska, as he was realizing anew that he had scarcely skimmed the surface of the man-might of the Earth.

Now, seen through the myriads of the Dalis Gens, he could see again the on-rushing Aircars, and his heart misgave him for a moment as he could tell, by estimation, that at least a hundred families were outlined against each individual car, which moment by moment grew larger.

Those tentacles were now much in evidence, rising and falling under and around the racing Aircars like serpents, or dragging ropes; but seeming like living things in the sentient manner of their moving—eager to come in contact with the first of the earthlings, and to wrap those tentacles about them, crush them, hurl them into space.

Sarka went back into the laboratory only long enough to attune the Beryls of the Earth to a point where the Earth would remain almost stationary, comparatively speaking, taking a curving course about the surface of the Moon, as it had for countless millions of years coursed about the Sun.

Then, back to the Observatory, to see how went the battle. Through the Micro-Telescopes the first

meeting was plain to be seen. The Gens of Dalis rushed headlong to meet the Aircars and many of them rushed headlong to their destruction.

Sarka noted a group of perhaps a hundred people break forth from the vanguard of the attackers, and mount to a safe height above the Aircars against which the Gens were hurling themselves. A sigh of relief escaped him, and he wished there were some way in which he could learn the individual identities of the ninety and nine who had taken Jaska forcibly out of danger! For her white clothing, and her Red Lily of Cleric were plainly visible and recognizable! The men of the Gens of Dalis might permit the leadership of a woman, but they would not permit her to be needlessly endangered.

Sarka turned to Dalis, and noted that the face of the master egotist was pale and drawn, his nostrils quivering with emotion, as he watched his Gens go into battle, and a feeling of satisfaction coursed through Sarka like a little white flame. Dalis was proud of his Gens, and now was wishing that he, and not Jaska, were leading them onward.

"I would wager something," whispered Sarka to himself, "that Dalis will not be able to stand it! That before battle has been joined for ten minutes, he will have gone out to take over the leadership of the Gens! Jaska must have guessed that, too! Wise, clever Jaska!"

With a fearless massing of forces, the people of the yellow stars joined battle with the Aircars! The manner of men who flew the Aircars was still unknown to the people of Earth.

But in a trice they would know.

In a matter of minutes Earth would realize the horror of what faced the Gens of Dalis, whom Jaska led!

For with the sending out of their Aircars the Moon-men had given but the merest hint of their ponderous, devastating might!

Chapter 10: *Tentacles of Terror*

Dalis had always been a stormy petrel, but as he sat before his Micro-Telescope, watching his Gens go into battle against the Moon-men, not even Sarka the Second guessed the depth of infamy of which Dalis was capable.

Dalis had given a hint, but Sarka had, in his sudden realization of the fact that Jaska really loved him, and was no traitor, forgotten that hint. How had Dalis learned the secret sign-manual of Jaska and Sarka? Therein lay the hint.

Dalis, in common with all other Earth's scientists, possessed the ability to think deeply, yet to so mask his thoughts that no one else could grasp them telepathically—and it was well for the peace of mind of the Sarkas that they could not read the black thought of the man, or look into the future, even so far as a dozen years.

The Gens of the yellow stars moved into contact with the Aircars of the Moon. Earth and Moon were

gripped in the horror of war, the war between worlds, where no quarter might be asked or given, because fought between alien peoples who did not so much as comprehend each other's languages, or even their signals.

The people of the Gens swarmed about the Aircars like myriad swarms of angry bees, but it was only to Dalis that this simile came, for only Dalis, of these three, had ever seen a swarm of bees.

Sweeping in closely, the Gens brought forth from their resting places in their Sarka-Belts their Ray Directors and their Atom-Disintegrators, and turned the blighting rays of them against the gleaming, ice-colored sides of the aerial monsters.

But even as the Gens brought their instruments of destruction into play, the mighty tentacles of the first hundred Aircars had got into action. Down they whirled to catch at the flying bodies of the pigmylike individuals of the Gens, and hundreds of Earthlings were caught in those tentacles in the first moment of conflict.

Sarka studied the reaction of the people, thus captured. He could see the expressions of unutterable agony on their faces, could see their cheeks turn black with—what? There was no way of knowing; but all sorts of guesses were possible. Those tentacles, from their action upon the human beings which they encompassed, might be charged with electricity. For the people they captured turned black, then shriveled slowly—and were released by the tentacles....

They fell sluggishly away, through the great space which yet separated the Earth and the Moon. But the people who fell, fell aimlessly, going neither toward the Earth or the Moon, like black feathers in a vagrant breeze.

"Great God, do you see father?" cried Sarka. "The—whatever it is—that turns our people into cinders and drops them, has no effect on the Anti-Gravitational Ovoids in the skull-pans of the helmets, and without mental direction, the Ovoids neither rise nor fall but wander aimlessly!

"See? As the fight continues, those who still live, as

they dart here and there through the battle area, will be confronted continually by the blackened faces and shriveled figures of their departed friends, relatives and neighbors, and will see at first hand what will happen to themselves if they are caught by the tentacles!"

From the lips of Dalis came one single burst of laughter, filled with bitterness. No other word came from his lips, no other sign. He merely sat and stared, and masked his hell-black thoughts so that neither of the Sarkas might read them. But in the fertile mind of Dalis a plan was being born—a plan that, he knew, had always been growing back in his mental depths, somewhere, down the centuries, since first he had become an enemy of the Sarkas. The Sarkas ruled the Earth, and....

But he would spring his surprise when he believed the time right, for Dalis possessed a faculty which neither of the Sarkas possessed—an example of it being his incomprehensible knowledge of the secret code of moving fingers used by Sarka and Jaska.

The Gens of Dalis drew back in consternation at this wholesale taking off of the first line of attack. Out of that first line, comprising perhaps a thousand families, scarcely a hundred had escaped the groping of those mighty tentacles of the Aircars—and the black, shriveled things which had been men floated all about the Aircars which had destroyed them, warnings to those who followed them into the fray. Those who had somehow escaped the wrath of the tentacles in the first engagement fled back into the heart of the next line of sky-skirmishers, fear and horror in their faces.

Here, answering to the will of Jaska, a mile or so above the heart of the conflict, they reformed with their people, and prepared again to attack. But how to attack these formidable Aircars successfully?

That was the question. Ray Directors had been turned against them, but something was decidedly wrong. The first car to feel the blast of even one of those Ray Directors should have vanished, become as nothing, as had the body of Sarka the First before the Ray Director of Dalis.

But apparently nothing had happened. Why?

Grimly Dalis and the two remaining Sarkas pondered the problem, wondering at the same time what Jaska would now do, how reform her Gens, how send it again to an attack that seemed hopeless.

"There they go again!" whispered Sarka.

The first two myriads of the Gens of Dalis had now crowded together until they formed a veritable cloud which masked, for a moment, the Aircars of the Moon. Then, as one person, answering to the will of Jaska, they swept in to the attack again.

But as they approached the Aircars, they divided four ways—up, down, to right and to left, and smashed into the Aircars from four directions at once. Jaska, knowing that countless lives must be lost to destroy these monsters of the Moon, was trying to down them by mass attack, hoping that, while the inner groups gave their lives, those who followed after them would get in close enough to use their Ray Directors and Atom Disintegrators.

"She is wasting lives to no avail!" cried Dalis. "There is a way to beat these people!"

"It is really your responsibility, O Dalis!" snapped Sarka. "Why do you not go out and lead your Gens? If you know, why remain here and watch the destruction of all the people of your Gens?"

"You know why our Ray Directors and Atom Disintegrators do not work, or work but poorly? Because our fighters are within the gravitational pull of the Moon, instead of the Earth, and machines which work perfectly on Earth are thrown out of balance when under the influence of the Moon!"

"Then," cried Sarka, "we must sweep in close enough to our people...."

Without waiting to say another word, for thousands of men were dying each breath-space, Sarka raced into the laboratory and gave the signal to race up the speed of the Beryls, to attune them with the increasing speed of the Master Beryl, whose jade lever now was set at the halfway mark in the onyx

slot.

When he returned to the Observatory, Dalis was gone, and Sarka the Second sat alone.

"I knew he would go," said Sarka, "for he cannot endure to see someone else take credit for winning this first victory—if it is even possible to win it! I knew that, vain though he is, Dalis is yet a man!"

"I am not so sure of that, son!" replied the Elder Sarka. "For I have known him longer than you have! There's something else in that brain of his which takes no thought of the death of people of his Gens—or for the betterment of the other people of the Earth! I wonder...."

But even as he spoke, Dalis was away, flying free and fast toward the scene of battle. In a few minutes his will would be felt by his Gens, and Jaska could return again. Sarka sought for her. She was still safe, high above the battle. Thousands and thousands of those shriveled things now floated in the space about the cars, above them, below them, everywhere. But the

Gens of Dalis had at last caused some trouble to the Aircars of the Moon.

A hundred of them, like stricken birds, were falling downward toward the Moon, great holes torn in their sides. But as they fell, their tentacles, which whipped here and there like snakes in their death-throes, carried with them their full capacity in people of the Gens of Dalis!

With the partial destruction of the Aircars which were falling, the force that actuated the death-dealing of those tentacles seemed to have gone out of them. For the people now held in the grip of the mighty tentacles were still alive! Their squirmings could be plainly seen, and their cries could have been heard, had it not been that the noise of battle drowned out all other sounds.

A hundred Aircars falling, and the men and fighting women of the Gens of Dalis, with new courage in them now they realized that the Aircars were not entirely invincible, renewed the attack with savage vigor.

Taking no thought of the death which must surely come to them, they circled and pressed the Aircars; and when the tentacles caught at some of them, others climbed to the very body of the Aircars, over the shriveling bodies of the dying, and turned their Ray Directors and Atom Disintegrators against the gray sides of the monsters.

Even before Dalis had reached the vanguard of his Gens another hundred Aircars were falling, each with its tentacles wrapped tightly about such of the earthlings as they could grasp. Falling ... falling ... still living, plunging down.

Now Dalis had reached the scene of the fray, and was assuming command.

As he did so a single white-robed figure, life-size when seen through the Micro-Telescopes, darted out of the fray and headed at top speed for the dwelling place of Sarka. Jaska, relieved, was returning home!

But though Jaska flew at top speed, she did not seem to grow larger, or draw nearer to the Earth!

Out of the ruck of the defenders of the Moon, a single Aircar, whose gleaming gray side was marked with queer crimson splashes, broke free to pursue Jaska!

She fled at top speed, yet the Aircar was gaining, proof that the Moon had developed speed greater than Earth had attained.

"But why," queried Sarka, "does she draw no nearer?"

"Great God!" ejaculated Sarka the Second, after a brief examination of certain chartographs beside his Micro-Telescope. "We are moving away from the Moon! Something is forcing us away! The people of the Moon have something whose nature we do not know, capable of forcing them away from us—while they pull our people toward them! You see? If they pulled us toward them, we could overthrow them, for we outnumber them perhaps thousands to one; but if they force themselves away faster than the Gens of Dalis, if defeated, can follow us, they can destroy, or capture, the Gens at their leisure!"

Suddenly, out of the Earth, past the all-seeing eyes of

the Micro-Telescopes, swept a new myriad. Men in white, wearing the Red Lily of the House of Cleric! Cleric was sending out men to rescue Jaska from the Aircar which pursued her! But would Jaska or these who went forth to fetch her ever be able again to attain landing place upon the Earth!

It looked doubtful.

Even as Sarka asked himself this question fresh Aircars shot from the rims of Moon craters, rushing outward to add their weight in the battle against the Gens of Dalis. The Gens of Dalis was doomed!

In the mind of Sarka the Second there still loomed a hellish doubt that would not down.

The men of Cleric were surrounding Jaska now, protecting her with their lives against the tentacles of that lone Aircar splashed with crimson—and all were flying a losing race with the Earth, which was still being forced outward from the Moon!

Chapter 11: *Escape—and Dalis' Laughter*

But Sarka was not to be so easily beaten. There still remained an infinite number of possible changes of speed by manipulation of ovidum by vibration set up by the Beryls, without which this flight from the beginning would have been impossible. But for two hours, while the white robed men of Cleric fought against the car of the crimson slashes to prevent the capture of the daughter of their Spokesman—and died by hundreds in the grip of those grim tentacles—Sarka was forced to labor with the Beryls until perspiration bathed his whole body and his heart was heavy as he foresaw failure. And failure meant death or worse for Jaska.

But at the end of two hours, while the men of Cleric fought like men inspired against the Aircar of the crimson slashes, a cessation in the outward speed of the earth could be noted. At the end of three hours the body of Jaska, all this time fighting manfully to attain to landing place on the Earth, was at last bulking larger; but the tentacles of the Aircar were groping after her, reaching for her, striving to catch

and clasp her to her death.

The two Sarkas watched and prayed while the might of the Beryls, traveling at top speed, fought against the force of whatever was used by the Moon-men to compel the Moon to withdraw. Still the men of Cleric fought that single car, and died by hundreds in the fighting. White robed figures which became shriveled and black in the grip of those tentacles.

Countless of the men of Cleric deliberately cast themselves against those tentacles, throwing their lives away to give Jaska more leeway in her race for life.

"Will she make it, father?" queried Sarka in a whisper.

"If the courage and loyalty of her people stand for anything, she will make it," he replied.

On she came at top speed, and now through the micro-telescopes the Sarkas could see the agony of effort on her face, even through the smooth mask used by the people of Earth for flight in space where

there was no atmosphere. Courage was there, and the will of never-say-die; and Jaska, moreover, was coming back to the man she loved. In a nebulous sort of way Sarka realized this, for though these two had not mated there was a resonant inner sympathy between them which had rounded into an emotion of overpowering force since Jaska had proved to Sarka that she was to be trusted—that he had been something less than a faithful lover when he had mistrusted her, ever so little.

Closer now and closer, and at last the Aircar of the crimson splashes was drawing away, losing in the race for life. It was falling back, as though minded to turn about and race back for the Moon, now a ball in the sky, far away, the outlines of its craters growing dim and misty with distance. Now the men of Cleric, those who remained, were breaking contact with the Aircar, and forming a valiant rear-guard for the retreat of Jaska.

Throughout the Earth, as the Beryls fought with ever increasing speed to lower the rate of the earth's outward race from the Moon, was such a trembling,

such a vibration induced by conflicting, alien forces as there had not been even in that moment when back there in its orbit, the Earth could have either been kept within its orbit, or hurled outward into space at the touch of a finger.

Now Jaska, surrounded by her father's men, was almost close enough to touch the Earth.

She made it, weak and weary, and rested for a moment while her father's men steadied her. Then, thrusting them aside, with gestures bidding them return to their Gens, she lifted into the air again, and fled straight for the laboratory of Sarka.

She entered tiredly through the exit dome, and all but collapsed into the arms of Sarka. Gently he removed her helmet of the anti-gravitational ovoid, noting as she leaned against him the tumultuous beating of her heart. Then her gentle eyes opened and she whispered to Sarka.

"You trust me now?"

For answer he bent and kissed her softly on the lips—for the kiss, from the far distant time when the first baby was kissed by the first mother, had been the favored caress of mankind. Her face was transfigured as she read his answer in his eyes, and the touch of his lips. Then, remembering, fear flashed across her face. She straightened, and grasping Sarka by the hand, hurried with him into the observatory.

She took the seat in which Dalis had sat before he had gone out to the command of his Gens, studied for many minutes the battle in space between the two alien worlds.

"Dalis is winning," said the Elder Sarka quietly,
"apparently!"

"The qualification is a just one," said Jaska softly.

"'Apparently,' indeed! You will note now that, though men of the Gens of Dalis swarm all about the Aircars, and even clamber atop them, no more are dying in the grasp of those tentacles? Is Dalis arranging a treacherous truce with the Moon-men?"

"I have been wondering about that," said Sarka softly, "for it is my belief that nothing not conducive to his own selfish interests would have forced Dalis to leave this place and take command of his Gens, as I had first ordered, unless he had schemes planned of which father and I could know nothing. Now that I think of it, Jaska, how did Dalis know our secret code of fingers?"

Jaska started, and turned a blanched face to Sarka.

"*Did* he know?" she cried. "Did he? If he did that proves a suspicion that I have entertained since the first moment when Dalis swept into the fight, and I sensed that alien signals were being flashed back and forth!"

"Flashed back and forth!" ejaculated Sarka. "How do you mean? That Dalis was somehow able to communicate with the Moon-men in their own language, or through their own signals?"

"Why not? He knew our secret code, did he not? I never gave it to him, and I know that you did not. No,

Dalis has some means, never discovered or suspected by you Sarkas, whereby he is able to understand alien tongues and alien sign manuals!"

"That means," said Sarka the Elder in a dead voice, "that by forcing Dalis to go out at the head of his Gens...."

"We have," interrupted Sarka the Younger, "placed a new weapon of treason in his hands! Dalis, at the very moment of contact with the Aircars, loaded with Moon-men, broke in on their signals—they must have had some means of signalling one another—and communicated with them in their own way! Do you think it possible that, with all his Gens, he may go over to the Moon-men, form an alliance with them?"

For many moments no one dared to answer the question; yet, from what the Sarkas knew of him, it was not impossible at all. For Dalis was the master egotist always, and never overlooked opportunity to gain something for himself.

It was Jaska who broke the silence.

"Did you note carefully," she said, "those Aircars which were partially destroyed by our ray directors and atom-disintegrators?"

The Sarkas nodded.

"Did you note that no men, formed like our own, no creatures of any sort whatever, fell from the cars?"

Again the awesome silence, and the keen brains of the Sarkas wrestled with this vague hint of the uncanny.

"You mean, Jaska ... you mean...."

"That the occupants of Aircars are part of the cars, but—Beings of the Moon! That they are either metal monsters endowed with brains or tiny creatures irrevocably attached to the cars themselves!"

"But how," said Sarka at last, "are we to be sure? I can understand what Dalis might do if the Moon-men granted his wish for an alliance with them. It is easy to understand why his Gens would follow his lead, for

with the Moon forced outward from the Earth faster than his Gens could retreat, there is but one direction for his Gens to go—toward the Moon! They would go to the Moon as captives and trust the keen brain of Dalis to gain the mastery, sooner or later, over the Moon-men. And then...."

"And then—?" repeated Sarka the Elder.

"Then, Dalis has already been inspired by the speed with which those Aircars travel! You will remember that he did not take kindly to leaving the Earth and making his abode on some other planet! But why could he not do so, combine forces and knowledge with the people of that planet—and then return to Earth in alliance with them?—after we have depleted our forces by placing a large portion of our people on Mars and Venus and Saturn?"

"Sarka, my son," said Sarka's father, "before we continue with our flight to Mars, we must know the truth! We must somehow learn exactly what is going on on the Moon! If you could reach the Moon, alone, undetected, and bring back a report...."

For a moment he left it there, and the faces of all three were gray with worry and abysmal fear.

"I can't go bodily, father," said Sarka at last, "but you remember my secret exit dome, to the right of the observatory, from which I have never yet dared exit from this place for fear that it might cost me my life?"

Sarka the Elder nodded, while Jaska looked puzzled. Another evidence of the fact that Sarka had not always trusted her, for she knew nothing of a secret exit dome. Sarka's eyes, as he looked at Jaska, mutely asked her forgiveness, which she gave him with her smile.

"I remember, son, and now...?"

"Surely it is worth risking one's life to know what new menace looms over the children of men!"

"What is the use of this secret dome?" asked Jaska softly.

"It is merely an elaboration of the regular exit dome,

combined with certain phases of our atom-distintegrators, and the principle involved in the anti-gravitational ovoids. I step into the secret exit dome, garbed for flight Outside, and will myself to appear bodily in a certain place. It is instantaneous. I step into the dome, for example, and will myself to appear whole upon the Moon, and there I will appear!"

"You mean that during the period of transposition you are invisible?"

"Yes, invisible because non-existent, except for the essential elements of me, broken down by the secret exit dome, reassembled at the place willed in their entirety! I can't fly there, for a million eyes would see me approach! I must go in secret, as a spy, and wearing the clothing and insignia of a member of the Gens of Dalis!"

Silence in the observatory for a brief breathing space, and then Jaska spoke that speech out of the books of antiquity, which remains the classic expression of loyalty.

"Whithersoever thou goest, there will I go also!"

From the laboratory came a sudden burst of laughter, the laughter which all three recognized as the laughter of Dalis; but when they entered the place of the Revolving Beryl, there was no one there—and a feeling of dread, all encompassing, held them thralled for the space of several heart-beats. Dalis, they knew, was thousands of miles away, upon the Moon; yet here in the place of the Master Beryl they all three had just heard his sardonic laughter!

Chapter 12: *Ashes of the Moon*

Through the micro-telescopes it was possible to see what had happened after Dalis had assumed command of the Gens of Dalis. For even though the Moon, in spite of the speed of the Beryls, was being forced further and further from the Earth, the eyes of the micro-telescopes picked out and enlarged details to such an extent that the battle seemed to be transpiring under the eyes of the beholders.

A terrific jumble, in which Earthlings and Aircars were all tumbled together in mad chaos, a great mass of writhing, green-garbed figures. Infinite in number—in the midst of which were the gigantic Aircars, like monster beetles being beset by armies upon armies of ants.

Then, by the time Jaska had seated herself in the observatory atop the Himalayas, to watch what developed, the battle seemed to be over, and the Moon-men had won. For the huge cars swung around between the myriads of the Gens of Dalis, and seemed to be herding them toward the Moon, as though they

were prisoners.

Telepathically, Sarka and his father had been able to catch some hint of the thoughts of the Earthlings in the battle, and these thoughts had been tinged with doubt, fear and horror, so that even thus to receive them, by mental telepathy, was to feel the searing heat of their fear.

Now, in the instant when the battle in Space seemed to be over and the Gens of Dalis were prisoners, the thought waves were no more, and a brooding silence took their place. Dalis, the Sarkas knew, possessed the power to mask his thoughts, for it was a power possessed in common by all the scientists of Earth. But the common people of his Gens did not possess that power. However, for the moment Sarka had forgotten an all important something: that, when people were outside the roof of the world, they were subservient to the will of a common commander to whom they had sworn allegiance.

If, therefore, Dalis could mask his own thoughts from the brains of men, he could also mask the thoughts of

the people of his Gens, merely by willing it! So Sarka and his father and Jaska could not know whether the Gens of Dalis had gone over in a body with him, in a truce with the people of the Moon, or whether they were dual prisoners—of Dalis and of the Moon-men!

More than ever was it necessary for someone to somehow reach the Moon and make a thorough investigation, discover just what Dalis was doing, what mischief he was hatching.

The secret exit dome seemed to be the answer.

"You can manage without me, father?" asked Sarka.

The elder Sarka nodded.

"Of the other Spokesmen of Earth," went on Sarka, "I trust Gerd the most. Might I suggest that you bring him here, trust him in all details, and let him take my place wherever possible? Or, better still, keep Jaska here with you! I ... I may not be able to return! I'll try to find a way, but—we can always communicate telepathically. Jaska...."

"Jaska," said that young lady grimly, "goes with Sarka wherever Sarka goes!"

"But it may mean death! We can only guess at the cunning of the Moon dwellers! They may have been in secret communication with Dalis for centuries! Dalis, who somehow discovered our secret finger code, may also know of the secret exit dome, and the principle upon which it operates! If he does, he may know how to combat it! Perhaps that explains his laughter! Perhaps he heard and understood every word we spoke, hears and understands every word we speak now! Who knows? He may wait until I have passed through the secret exit dome, and then make it impossible for me to be reincarnated on the Moon—or elsewhere!"

"No matter," said Jaska softly, "wherever Sarka goes, there goes Jaska! It is useless to attempt to dissuade me, and it is time you learned that!"

In spite of himself Sarka smiled, and his father met his smile with a quizzical one of his own. Both men had the same thought.

"The eternal woman!" said Sarka the Elder. "No man has ever understood her—no man ever will! And all men are ruled by her!"

Sarka shrugged, and Jaska spoke again.

"Don't you think it is time we tried this new experiment?"

Sarka nodded, and his face was suddenly alight with the excitement which burned within him.

"First," he said, "we need accoutrements of the Gens of Dalis for two people!"

Jaska smiled.

"Forseeing that we might have need of such equipment, I had several complete outfits sent here when I took charge of the Gens of Dalis as its Spokesman!"

Two minutes later, arrayed in the green clothing of the House of Dalis, swathed in it from neck to toe,

wearing their belts and the masks which were necessary to life in space where there was no atmosphere, the whole topped by the gleaming helmets whose skull-pans held the infinitesimally small anti-gravitational ovoids, Jaska and Sarka entered the secret exit dome, side by-side.

On the breast and back of each showed the yellow stars of the Gens of Dalis. There was no hiding their identity otherwise, and if any of the Gens saw them, both would be immediately recognized—for Jaska had commanded the Gens, and Sarka was the world's greatest scientist known to every human being. But they planned on carrying out their investigations by stealth.

"Father," said Sarka, "when the inner door is closed upon us, you have but to press the button to the right of the door. Press it when the light beside it glows red, which will indicate that we have willed ourselves to go to a certain destination!"

The inner door closed upon Sarka and Jaska, and, hand in hand, side by side, their bodies glowing with

knowledge of warm, sympathetic contact, they waited for a miracle which had never before been attempted.

"Are you afraid, beloved?" queried Sarka.

"When I am with you," she said softly, "I have no fear."

"Then face the outer door, and will to go wherever I will to take you!"

Side by side, hand-in-hand still, they faced the outer door, and Sarka willed:

"Let us appear together in a deserted spot, within sight but unseen, of the Moon crater from which those Aircars were sent against us!"

A sudden blur, a cessation of all knowledge, and then....

Sarka and Jaska stood side by side in a desolate expanse surrounded by bleak and appalling mountains of grotesque shape, in a light that was weirdly, awesomely blue. Their feet were invisible,

deeply rooted in some soft, fine material which looked like snow.

After a swift glance around to see if anything lived or moved in this awful desolation, Sarka stooped and dipped up some of the fine stuff with his fingers, touched it to his lips.

The material seemed to be fine blue ashes and on his tongue it had a soapy savor. He peered at Jaska, whose eyes were glowing with excitement, whose lips were parted with anticipation, and instantly he opened a mental conversation with her.

::We must speak with each other telepathically, but do not speak with me until I have explained to you how to mask your thoughts from all persons save the one with whom you hold converse! First, I love you! Second, let us see if, searching the sky, we can find the Earth!::

In a few brief, highly technical words, Sarka told his beloved how to talk with him in the manner which he had never before explained to her. They had used

telepathy before, countless times, but they had not cared who heard—while now secrecy in all things was the prime essential for success, even for life.

When he had told her, and she replied, ::I understand perfectly, and it seems quite easy,:: they turned and surveyed the heavens, out of which, by this new miracle of the secret exit dome, they had dropped to the face of the Moon.

Away across the space between worlds, its transfiguration plainly visible to the two, they could make out and identify the world from which they had come. Save that they knew themselves standing on the Moon, they would have thought as far as appearances went, that the place where they had come was the Moon, many times enlarged. It seemed incredible that they had come so far in the twinkling of an eye; but that they had was proved by the fact of their physical presence.

::Look, Jaska!:: said Sarka suddenly. ::See how our Earth glows, as though it were afire inside!::

They stared at the great circular yellowish flame that he pointed out, and Sarka, always the scientist whose science was one of exactness, tried to estimate just where, on the Earth's surface, the glow was.

::Jaska,:: he said again, ::that glow comes out of the heart of the Gens area which Dalis ruled! And no one lives there, since Dalis' Gens flew out to do battle! That's why we did not know of it before we left! That glow, somehow, beloved, is the cause of the outward-from-the-Earth journey of the Moon! First we must locate the Moon-source of the glow, and render it incapable of further forcing itself away! For do you realize that, unless we do so, we will never again see home?::

Jaska said nothing, but her eyes were troubled for a moment. Then she smiled again.

::What care I if I become a prisoner on the Moon, if you are with me?::

Sarka was just now realizing the wonder of this raven-haired woman whom, knowing her for half a

century as he had, he had just known so little after all.

::If we seem in danger of discovery, Jaska,:: he said to her, ::drop down instantly into the ashes, for if we are discovered by Dalis.....::

He left it there and, with a deep intake of breath, started away for the nearest and highest hill. They desired to walk, yet found walking almost impossible, as they could not keep their feet on the ground save by the exercise of a really incredible effort of will. So, despairing of keeping their feet in contact with the ashes, they flew just above them, heading for the nearest weird-looking ridge.

In the strange light, which was oddly like moonlight in some painted desert of Earth, shapes were distorted and somehow menacing, colors were raw, almost bleeding—and distances that seemed but a step required hours to traverse.

Ever and anon, as they traveled they looked back up at the Earth which was their home. It still was visible,

though plainly smaller with distance, and for a time Sarka's heart misgave him; but he only clasped tighter the hand of Jaska and moved on.

They were just at the base of the first hill, which had now become a mountain of gloomy, forbidding aspect, when the first sound they had heard on the moon came to them. A sound that was a commingling of the laughter of Dalis, the barking of jackals of the olden times, the humming of a million Beryls revolving at top speed, and a strident buzzing such as neither had ever heard.

Had they been discovered? Was the sound a warning? They could not know; but as they stared at the crest of the hill, two long, snaky, waving things appeared above the crest, undulating, waving to and fro, as though questing for something. They crouched low in the white ashes at the base of the mountain, and waited, scarcely breathing.

Chapter 13: *The Lunar Cubes*

For a long time Sarka and Jaska remained still, like sentinels, listening to the strange discord which seemed to emanate from behind the hill at whose base they crouched.

::Look!:: said Sarka at last. ::There against the sky, beyond and between those two waving tentacles! Note that column of light, scarcely lighter than the light which surrounds it everywhere? It looks like a massive column just lighter than everything around it, yet so little lighter that you have to watch closely to see it at all?::

Jaska stared for all of a minute, before she thought back her answer.

::I see it,:: she said.

::Note now whether it goes, as it reaches outward into Space!::

Jaska followed the mighty height of the thing,

outward and outward, and then gasped.

::Sarka,:: she said, ::its end touches the Earth in the very heart of that strange glow we spoke about!::

::Exactly! And people of Earth know nothing about it, because it is invisible to them! It is only from Outside that the glow it makes against the Earth is visible! If we can divert its direction, or render it useless in any way, the Moon will no longer be thrust away by its force!::

A pause of indecision, then Sarka thought again:

::Let us go, Jaska! Keep behind me, right on my heels!::

Slowly, fighting against something that seemed determined to pull, or hurl, them outward from the surface of the Moon with each forward movement they made, they essayed the side of the hill, pausing at the end of what seemed like hours in a sort of hollow just large enough to mask their bodies and stared over its edge into one of the craters of the

Moon. Out of the depths of that crater came the discordant sounds, which now were almost deafening, and out of that crater too came the almost invisibly bluish column whose outer tip touched the Earth.

Right before them, so close that they all but rested in its shadow, was one of those monster Aircars, its tentacles moving to and fro as though wafted into motion by some vagrant breeze. But since neither Sarka nor Jaska could feel the breeze, Sarka knew that it was life which caused the waving motion of those tentacles of terror.

::Note,:: he said to Jaska, ::that there is a tiny trap-door in the bottom of the Aircar, and that the thing rests on a half-dozen of those tentacles!::

::I see,:: came Jaska's reply.

Jaska went on:

::Note the gleaming thing on the ground, right below the Aircar? I wonder what it is?::

They studied the thing there, which seemed to be a huge jewel of some sort that glittered balefully in the eery light of the Moon. It was, perhaps, twice the size of an average man's torso, and was almost exactly cubical in shape. As Sarka studied the thing, he sensed that feeling flowed out of it—that the cube, whatever it was, was alive!

He tore his glance away from it, and realized that he accomplished the feat with a distinct effort of will—as though the cube had willed to hold his gaze, knew he was there. His eyes, peering around the inner slope of the crater—which dipped over, some hundreds of feet down, and plunged downward to some unknown depth—noted a broad, flat stone, off to his right; and around the rim of the crater he counted a full hundred of the Aircars, all with their tentacles waving as if they belonged to sentient creatures.

Below each one, as he studied them and strained his eyes to make out details, he caught the baleful gleam of other cubes like the first he had seen. The Aircars, it seemed, were either sentinels, at the lip of the crater, or were the dwelling places of sentinels—and

the cubes were those sentinels!

It seemed absurd, but it came to Sarka in a flash that that was the answer, and his eyes came back to the first cube, because it was nearer and more easy to study.

::I will not be swayed by the will of the thing,:: Sarka told himself. ::Nor will I allow it to analyze me! Jaska, do you do likewise!::

Beside him, Jaska shivered. He turned to look at her. Her face was coldly white, and her eyes were big with terror and fascination as she stared at that first cube, resting so balefully there under the first Aircar.

He shook her, and she seemed to bring her eyes to his with a terrific, will-straining effort.

::Look at me!:: he told her, telepathically. ::Keep your eyes on me, for to look at the cube spells danger!::

But his own eyes went back to the thing, and he studied it closely. A cold chill raced through his body

as he noted that its gleam was becoming dull, fading slowly out. It had gleamed brightly at first, and now was losing its sheen, fading away to invisibility. He thought he should be able, regardless of gleam or color, to see its outline; but its outline, too, seemed to be becoming faint, indistinct.

Then, in a trice, it was gone, and a feeling of uneasiness, more compelling than he had ever known before, coursed through the soul of Sarka. Where had the cube gone? What was it? What was its purpose? He tore his eyes away from the spot where he had last seen it, and stared away to the shadow beneath the second nearest Aircar, where he had glimpsed another of the cubes.

The cube there, too, was fading out.

::Sarka! Sarka! Look!:: came to his brain the thoughts of Jaska.

Sarka turned and stared at her, and a feeling of fear for which he could not account at all took fast hold of him. The eyes of Jaska, wide and staring as they had

been when he commanded her to look away from the cube under the Aircar, were staring at that flat, table-like rock, off to his right.

There, almost in the center of the rock, a gleaming something was taking shape! Just a dull spot, in the center of the yellow glow; then the beginning of the outline of a cube. Then, all at once, the cube itself, gleaming and baleful!

Sarka gasped in terror. He had seen the cube vanish, its glow disappear, and now here it was, almost close enough to touch, on a rock beside him, gleaming and baleful as before! That it was the same cube he had seen under the first Aircar, he somehow knew without being told. That it was a sentient *thing* he also knew, for now there was no mistaking the fact that, but for the presence in the little hollow of Jaska and Sarka, the cube would not have moved.

Swift as light, Sarka's right hand darted to his belt, where his ray director should be nestled against his need of it. And with his first movement, the cube's brilliance vanished instantly, the cube disappeared,

and appeared again right before the face of Sarka, so close he could touch it! Yet he did not turn the ray director against it, nor did he extend his hand to touch the thing—because he was afraid to do so!

Even as the cube appeared before his eyes, thrice baleful and menacing in its close proximity, his eyes darted back to that broad flat rock, where the second gleaming cube now appeared!

::Great God, Jaska!:: he sent mentally, ::what does it mean?::

::These,:: she answered bravely back, ::are Moon-soldiers! And, unless we manage not to appear furtive, we are undone!::

Still Sarka made no move, while other gleaming cubes appeared on the flat rock. Five other cubes appeared beside the first, at the rim of the hollow which held the forms of Jaska and Sarka. The cubes were closing on them, oddly like a squad of Earthlings in the olden times, advancing by rushes against an entrenched enemy!

The buzzing sound which they had first heard now seemed accentuated, but, instead of being outside of the listeners, seemed inside them, hammering against their very brains! Messages were being sent to them, or passed back and forth between and among the cube-men about them—and they hadn't the slightest idea how to make answer, know whether an answer was expected of them, or what the cube-men thought about them!

Since there was nothing else to do, they lay there, hands clasped, as children in the dark clasp hands, and waited for what might transpire.

Suddenly the discord from the inside of the crater ceased, and all was still, while it came to Sarka that the cube-men who stood before him were in grim communication with something invisible to Sarka and Jaska, somebody, perhaps, deep in the bowels of the Moon, over inside the crater.

They knew, those two, that the cube-soldiers were reporting their presence, and asking instructions; that the Moon had gone silent to listen, and that within a

few moments their fate would be decided. What should they do?

In his hand Sarka held his ray director, with which he knew he could blast one or all of the cubes into nothingness. But still he held his hand, made no move.

Something, however, had to be done, for the discord was starting again, growing in volume. It made Sarka think, oddly enough, of a deaf mute fighting for speech! Then came the first intelligible sound....

A burst, from the depths of the crater, of sardonic laughter!

::Dalis!:: said Sarka, and moved. While Sarka moved, Jaska held fast to his arm. Casting her fear to the winds, furious because of the laughter of Dalis, Sarka thrust his ray director back into his belt and stood upright.

Bending over he seized the first of the gleaming cubes and hurled it over the edge of the crater, saw it start

plummeting down. But even before it fell out of sight within the crater its gleam had dulled until it was almost impossible to see the thing. Racing as though racing against time, Sarka caught up cube after cube and hurled them all after the first.

Out of the crater there came no sound of heavy objects striking, though Sarka felt there should have, for the cubes were almost as heavy as a man.

Then his hair almost stood on end under his helmet, for under that first Aircar, where he had first seen it, the initial cube was again gleaming into life!

The thing had dissolved while being hurled over the rim, and reformed in its proper place, its station as silent sentinel under the Aircar!

These cubes then, were indeed sentinels—sentinels impossible to injure. Though no force had been used against Sarka and Jaska, Sarka had the feeling that they were powerless, and that here on the edge of a crater of the Moon awful forces were being mustered against them. Mustered slowly, sluggishly, yet surely,

as though the mentality which mustered them knew them helpless, and that there was no need to hurry!

As for Jaska, she merely clung to Sarka and waited—trusting him no matter what might transpire.

On a blind chance, Sarka brought out his ray director again, turned its muzzle toward that invisibly-blue column, pressed with his fingers, moving the director back and forth.

Instantly the blue column seemed to break short off, while the broken upper portion started racing outward toward the Earth. Sarka watched it, and noted that the yellowish glow on the Earth, even as he watched, was fading out—disappearing!

::If the ray will smash the blue column, Jaska,:: he said, ::it will also destroy its source! Come! We will go look for it!::

And, holding her hand tightly, he rose to his feet and strode boldly down the inner slope of the vast crater.

Chapter 14: *The Crater Gnomes*

It seemed to Sarka, as he moved down the inner slope of the crater, that the cubes were somehow making sport of him, laughing at him, though no hint of laughter or anything resembling laughter emanated from them.

But, shutting his lips grimly, holding fast to Jaska's hand, he proceeded on, reached the lower portion of the inner slope, where it dropped off into a seeming black abyss, and dropped, keeping to a safe speed because of the fact that both he and Jaska were attired for movement in the air—though their manner of aerial transportation could scarcely be called flying.

The anti-gravitational ovoids simply rendered ineffectual the law of gravity.

Down they dropped, endlessly it seemed, while all about them, growing gradually, a bluish glow began to make itself manifest. Sarka turned and looked at the face of Jaska and noted that it—all her being—was

glowing with this strange radiance.

He smiled at her, and she smiled back.

Looking down now, to what seemed still a vast depth, they could see figures moving, tiny, almost infinitesimal, about a great circular cone, out of the depths of which came that strange bluish column whose outer tip touched the Earth.

Some inner sense warned Sarka not to touch that column, or to permit Jaska to do so. They dropped down beside it, while Sarka, for no reason that he could assign, once more took his ray director in his free hand and held it in readiness. It seemed so tiny and futile—so foolish for two people, one of them a woman—to go into the very heart of an alien world, against an unknown enemy, armed with such a tiny weapon. Two people against unguessed myriads, whose very nature was an enigma, even to Sarka.

Closer now appeared the bottom of the crater, whose floor seemed to be covered with something that looked like blue sand, or rock. From this bluish

substance the glow which bathed the two Earthlings seemed to emanate.

The funnel of the crater had now given away to the immensities of space, in all directions, and the cold of outside was being replaced by a warmth which promised soon to be even uncomfortable.

Then, without a jar, the two landed at the bottom of the crater, side by side, close enough almost to that great cone to touch it. Out of the cone came that bluish column, to shoot up through the funnel down which the two had lightly dropped ... and the motion of the—whatever it was—was accompanied by a muted moaning sound, like that of a distant waterfall.

They paused there, in amazement, taking stock of their surroundings. Huge tunnels, whose roofs were lost to invisibility in the bluish haze, whose extremities could only be guessed at, reached off in all directions. As far as the two could tell they were the only living souls within the crater, though both knew better.

Sarka had the feeling, and he knew Jaska shared it with him, that innumerable eyes were studying them, innumerable intellects were cataloguing them. And somehow he sensed the presence, somewhere near, of the traitor Dalis!

Then that discordant sound again, breaking so swiftly that it fell upon the eardrums of Sarka and Jaska like the crack of doom. Out of the many tunnels, from all directions, came hordes of beings which would have made the nightmares of Paracelsus—first of the scientists of Earth—pale to insignificance.

Paracelsus had written and illustrated his nightmares. Had hinted of strange acts of flesh-grafting—as the grafting of legs on the head of man. He had spoken, and written about, ghastly operations, from which men came forth as part men, part spiders; part men, part scorpions, dogs, cats, crocodiles....

Sarka thought, as his mind went back to those ancient books of his people in which still remained vestiges of the theories of Paracelsus, that somehow, in his dreams, Paracelsus must have visited the craters of

the Moon.

These people ... if they could be called people....

They had heads like the heads of Earthlings, broad-domed of brow, lacking eyelashes or lids, so that their eyes were perpetually staring. They possessed no bodies at all, and their legs, thin and attenuated to the size of the wrists of average men, seemed to support the massive heads with difficulty!

From all directions they came, looking like spiders such as Sarka the First had described to Sarka, when Sarka had been a mere boy. They came on the floor, out of the tunnels; they dropped from the walls of the tunnels, and down from the invisible roofs, landing on the floor as lightly as feathers—and all converged on Jaska and Sarka.

They seemed to have no fear at all, but only a vast curiosity.

Closer and closer they came.

Jaska's grip tightened on the hand of Sarka, for one of the creatures, with a spiderish leap, had jumped upon her, fastening its legs in her tight-fitting costume, where he hung, his face within an inch or two of hers. His lidless eyes, unblinking, stared deeply into hers.

Others jumped up beside the first, and still others clambered over Sarka, until both Sarka and Jaska were covered by them like beetles attacked by ants. But these strange gnomelike creatures, who did not fear these strangers, apparently meant them no harm.

Then, after a thorough scrutiny, began the strangest talking Sarka had ever heard. The crater-Gnomes seemed to communicate by making strange clucking sounds with their tongues, sounds which were unmusical and discordant, and which, as the Gnomes who stood back from them, because already the two were covered until no more could cling to Jaska or Sarka, joined in the speech—mounted in the cavern to a vast crescendo of sound.

Sarka knew then that this was the sound which had come out to them while they crouched at the crater

rim. These were people of the Moon: but if these were Moon-men, what, or who, were those gleaming cubes?

::Stand perfectly still,:: Sarka mentally admonished Jaska, ::they apparently mean us no harm!::

He had not spoken aloud, had not allowed his thought to reach any but Jaska; yet instantly the discordant clucking ceased, and the Gnomes were quiet, as though they politely listened to someone who had interrupted them, yet whose interruption they resented, or were curious about.

Wondering how the creature would regard his action, Sarka reached forth and plucked away the first Gnome which had jumped upon Jaska, and placed him gently on the ground. The thing merely stared at Sarka with his lidless eyes, as though wondering at Sarka's meaning. Then his lips, which were triangular, rather than straight as those of Earthlings, began again that strange clucking.

Immediately the Gnomes which clung to Jaska and

Sarka dropped away, and scuttled into the midst of the myriads that stood and watched. They did not understand the speech of these Earthlings, but they were unusually clever in comprehending the meaning of gestures.

::Hold fast to me, Jaska,:: thought Sarka toward her—and wondered anew as the Gnomes instantly ceased their clucking sounds—::for I am going to try an experiment.::

Holding her hand still, he turned and strode straight toward the huge cone out of which rose the bluish column.

Instantly the Gnomes broke into a frightful clucking of tongues, a sound that mounted to ear-drum-breaking intensity, and in a trice, climbing over one another to get into position, they moved in between Sarka and the cone. So eager were they to bar his further progress that they stood atop one another, until the depth of them was as tall as Sarka standing upright.

Yet, though they plainly said to Sarka: "You must not

approach the cone," they did not seem to be angry with their visitors, but only curious. Sarka looked at Jaska, noted how wanly she smiled.

Then he turned, and headed for the nearest of the monster tunnels.

Instantly he detected a surprising eagerness in the renewed clucking of tongues, while the Gnomes raced ahead, behind, all about the two, capering like pet animals, showing these strangers the way into the tunnel.

As they entered it, Sarka tried to discover whence came the bluish glow. The floor seemed to be of bluish sandstone, though its color, too, might have been caused by the glow. It was warm, too, so warm that perspiration was breaking out on the cheeks of Sarka.

Whence came the glow? Apparently from the very walls of the tunnel, or its roof; but surely from somewhere, surely from some secret place, whence it was diffused all over.

::And Jaska,:: said Sarka, ::the Moon, according to my father's researches, is literally honeycombed with craters like this one!::

Again, as he thought, that strange, sudden cessation of the clucking of the Gnomes. Whither were they leading them? It was plain to be seen that the Gnomes were heading for some destination, almost herding Sarka and Jaska toward it. Capering creatures, who behaved witlessly, yet were far from witless. If Sarka were not sadly mistaken, these were Moon-men—and women, too, perhaps, since he could not tell the sex of them—and those gleaming cubes were their outer guards, perhaps slaves.

If the cubes were really of metal—they had felt warm to Sarka's touch—then these Moon-men had gone further in science than Earthlings, as they had imbued at least some metals, or stones, with intelligence sufficiently advanced for them to perform actions independently of their masters' wills.

Sarka, too, was remembering another thing: that he had touched one of these Gnomes, to remove it from

Jaska—and had felt a distinct shock that was patently electrical!

The bluish glow was increasing, becoming more soft and mellow, shading gradually into golden, as they advanced—shading still as they preceded until it was almost white, almost blinding, in its radiance.

Then, of a sudden, the clucking of the Gnomes ended, and the creatures ceased their capering, fell into something that might have been an ordered military formation, and with Jaska and Sarka in the midst of them, moved straight toward a broad expanse of the tunnel wall, in the face of which appeared three long lines, deeply cut in the shape of a triangle.

The Gnome who had first leaped upon Jaska advanced to the wall, paused with his face almost against the lower line of the triangle, and remained there, intently staring, while the other Gnomes remained mute and unmoving.

Stronger and stronger appeared the blinding light. Slowly the inner portion of the triangle began to give

inward, like a door. And out of the opening came that blinding radiance.

As the triangular door stood entirely open, Sarka and Jaska stood in thunderstruck silence, staring like people bereft of their senses. For there, standing in the opening, the now white radiance itself a mantle to cover her, was a woman, unclothed save for the radiance, who might have been of the Earth, save that she was more beautiful than any woman of Earth.

Beside her the radiant beauty of Jaska paled, became wan and sickly.

But Sarka noted immediately her eyes, whose depths bewildered, amazed him. For in them he could see no expression, no feeling, but only abysmal cruelty. That she was Sarka's master, and Jaska's master, and master of all these Gnomes, became instantly apparent for telepathically she addressed Sarka.

::I am busy now. The Moon-people will hold you prisoners in the Place of the Blue light, until I am ready to give you to the Cone!::

Chapter 15: *The Place of the Blue Light*

So the Gnomes were Moon-people, masters of the Moon cubes! And people and cubes were ruled by a woman who resembled a woman of Earth!

The Gnomes took them back the way they had come.

Where, Sarka wondered, were the people of the Gens of Dalis? And where was Dalis himself! Sarka was sure that, in those first discords which had come out of the crater, he had heard at least a hint of the laughter of Dalis.

And this woman clothed in radiance—who was she? And what? That she was a creature of the Moon, and yet resembled in all ways a woman of Earth, save that she was more beautiful than any woman Sarka had ever seen, seemed almost impossible to believe. Yet he had seen her. So had Jaska, and as Sarka and Jaska, with the capering Gnomes still about them, were led away to a fate at which they could only guess, Sarka wondered at Jaska's silence and at the strange lack of expression on her face.

He pressed her hand, but somehow she failed to return the pressure, mystifying more than ever. This sudden coldness was not like Jaska.

Back they went through the vast cavern where the cone of the bluish column still moaned and murmured. Sarka moved as close to the cone as the Gnomes would permit, and peered up along the mighty length of the column. At its tip was still the Earth, like a star viewed from the bottom of a deep well.

Smaller, too, it seemed, which proved that Sarka's breaking of the blue column had been but momentary, that the column had almost instantly regained its contact with the Earth. What was its source, what the composition of the column?

At the moment there could be no answer to the question. Now the Gnomes were escorting them into another tunnel, whose glow was even bluer than that which the two had experienced in the other tunnels. And the deeper they penetrated, the more distant from the cavern of the Cone, the deeper in color

became that light.

Finally the Gnome who had mentally asked permission of the Radiant Woman to show her Jaska and Sarka passed before another expanse of wall, identical in appearance with that of the wall of the triangle from which the Radiant Woman had appeared.

This time the Gnome managed ingress by a strange clucking sound, with his triangular lips held close to the base-line of the triangle.

Now the door swung open; but the radiance which now came out was not clear white, as in the case of the outer door, but deeply, coldly blue. For the first time the Gnomes used force with their prisoners, thus proving to them that they were indeed prisoners. Their tiny feet caught at Sarka and at Jaska, and forced them through the door, which swung shut behind them.

Sarka looked at Jaska who, in this strange new light, had taken on the color of indigo, and smiled at her.

She did not return his smile, but her eyes looked deeply, somewhat sorrowfully, into his. As though she asked him a question he could not understand, to which he could therefore give no answer.

Sarka was now conscious of the fact that the heat of their prison-house—whose character they did not as yet know—was becoming almost unbearable. They were alone, too, for the Gnomes had not entered the door of triangle. Sarka partially removed his life mask, and testing the atmosphere of the place, found it capable of being breathed without the mask. He signalled mentally to Jaska to remove her mask, and when the girl had done so he took her in his arms and kissed her on the lips.

She accepted his caress, but did not return it, and her eyes still peered deeply into his.

::Well, beloved,:: he said. ::I am terribly sorry. But I did not want you to come because I was afraid that something of this sort would happen.::

She did not answer.

::What is it, Jaska?:: he said at last.

::What did you think of that woman?:: she asked softly.

::Beautiful!:: he said enthusiastically. ::Fearfully beautiful! But did you see her eyes? She had no more mercy in her heart than if she were made of stone! And she hated us both the moment she saw us!::

::And you, Sarka—did you hate her, too?::

Sarka stared at her, not comprehending.

::I feel,:: he said, ::that if we are ever to escape her, we must kill her, or render her incapable of retaining us!::

Then, of her own accord, Jaska placed her arms around Sarka, and gave him her lips. Her new behavior was as incomprehensible to Sarka as her former enigmatic expression had been. Wise in the ways of science was Sarka, but he knew nothing of women!

Now hand in hand again, they began a survey of their prison house. The bluish glow was unbearable to the eyes, and tears came unbidden and ran down the cheeks of the prisoners. In a minute or two, perspiration was literally bathing the bodies of the two. After a questioning exchange of glances, Sarka swiftly divested himself of his costume, stripping down to the gray toga of Earth's manhood. With a shrug, Jaska removed her clothing to her own toga, and the two suits Sarka carried under his arm.

They started ahead, exploring, then sprang back with a cry of fright. Sarka did not know whether it was Jaska or himself who had cried out; for just as they moved forward, a rent opened in the floor at their feet, and their eyes for a moment—they could stand no longer—peered into a bluely flaming abyss which, save for the color, reminded Sarka of the word pictures of Hell he had read in Earth's books of antiquity!

As the two stepped back, the rent in the floor closed instantly. Sarka had noted where the end of it had been, and started to detour, his eyes on the floor.

Over to his left the blue glowing wall reached up to invisible immensity. But as he would have passed along the wall, the rent opened again, effectually barring his way.

Beyond the rent he could see a vast continuation of the cavern, and he felt that, could they only pass the rent, they might reach a place where the heat was not so unbearable, and they could stay and talk in comfort.

Releasing Jaska, he stepped back and prepared to leap the spot where the rent had been. High he jumped, and far, surprised at the length of his own leap. He landed lightly, far beyond the area where the rent had been, and even as he landed, a rent opened again at his feet, thus effectually barring further progress!

::It could just as easily,:: he told himself, ::have opened under my feet, and dropped me into the abyss!::

From behind him came the sudden sound of

screaming. He whirled to look back, to see Jaska standing there, arms outstretched toward him, her eyes wide with fear and horror, and as he stood watching, she raced to him, unmindful of abysses that might open under her feet, and flung herself into his arms.

::Come back!:: she moaned. ::Come back! Don't you see? *They* don't wish you to explore further! We are in their power, and must simply await their pleasure, whoever or whatever they are! They see all we do!::

So they turned back, and stood against the door which held them prisoners; and the heat of the place seemed to enter into them, to gnaw at their very vitals. After a time Sarka found himself almost tearing at his throat, fighting for breath.

Gasping, the tears bathing their cheeks until even their tears and their perspiration would flow no more, they huddled now just inside the massive stone door, arms about each other, and almost prayed for death. Sarka at least prayed for death for both of them; but Jaska prayed for a way of deliverance, prayed that

herself and Sarka might somehow win free, and be together again.

Sarka, who knew little of women, marveled at the grandeur of her courage, and wondered that he really knew this radiant woman so little. He compared her in his mind with the unclothed woman who had ordered them here as prisoners, and it came to him that Jaska was all perfection, all tender womanhood, while the Radiant Woman was a monster, without soul or compassion—a creature of horror who mocked God with her outward seeming of perfection.

Jaska read his thoughts, and smiled wanly to herself, and Sarka wondered how, suffering as he knew she must be suffering, she could find the courage to smile.

Then, for a time, the two became comatose, mastered by the blue heat, and in dreamlike imaginings wandered in strange fields which could only, to these two, have been racial memories, since neither had ever seen such fields. There were cool streams, all a-murmur, and breezes which cooled their sun-tanned cheeks. Water touched their tongues, and cooled their

whole bodies as they gratefully imbibed it.

In their wanderings, in which Sarka was a faun and Jaska a nymph, they talked together in a language which only these two comprehended—a language which dealt in figures of speech, a language which depended upon handclasps for periods, glances of the eyes for commas, and the singing of their hearts for complete understanding.

Then a cool breeze, cool by comparison, caressed their pain-distorted cheeks, and the Gnomes came in, found them lying there, and clucked endlessly as though wondering what to do with them.

From hand to tiny hand, their feet serving as hands, the Gnomes passed garments—garments of the Gens of Dalis, and clothed again the two whom the Place of the Blue Light had all but slain. Of that ghastly experiment Sarka retained but one real memory....

That bluish light, in the midst of the abyss, shifting and swaying like blue serpents swimming in Hades ... that bluish light of the Cone, which he had broken up

for a brief moment by the use of his ray director. Was this bluish light in the abyss the source of the light in the Cone? If one were to destroy it at its source....

The two regained consciousness completely as the triangular door closed behind Sarka and Jaska and the Gnomes, and they were taken into the refreshing coolness of the tunnel, led back again in the direction of the room where they had seen the Radiant Woman. Both Jaska and Sarka noticed that they were clothed in new clothing, and a shy blush tinged the cheeks of Jaska as her eyes met those of Sarka.

This time they entered the vast chamber of radiance behind the first triangular door, and were forced to their knees to do obeisance to the Radiant Woman, who sat on a gleaming yellow stone for dais! The guards who forced Sarka and Jaska to their knees, were clothed in the green of the Gens of Dalis, and Dalis himself, his face stern, but bearing no sign of recognition of these two, stood at the right hand of the Radiant Woman!

::You come to us as spies,:: the thought of the Radiant

Woman impinged upon the brains of Sarka and of Jaska, ::and as spies you should be given to the Cone. But if you swear eternal allegiance to me, to obey me in all things, to forego your allegiance to Earth, your lives will be spared! What say you?::

Boldly Sarka stared into the almost opaque eyes of the woman. Then his glance went to the face of Dalis.

"What," he asked boldly, in the language of Earth, "does the traitor Dalis say?"

"I have sworn allegiance to Luar, who addresses you, and am her ally in all things! I have but one addition to make to what she says: Jaska belongs to me!"

The sudden leering grin of Dalis was hideous.

Sarka peered at Jaska, framing his answer. But Jaska spoke first.

"For myself, O Dalis," she said swiftly, "I can answer in but one way. Return me to the Place of the Blue Light, and forget me there!"

Sarka smiled, while his heart leaped with joy.

::And I, O Luar,:: he said mentally to the Radiant Woman, ::prefer death with Jaska, at the Place of the Blue Light, than life as a traitor to the world of my nativity!::

Instantly Luar began the clucking sound which was the language of the Gnomes, at the same time allowing her thoughts as she spoke to impress themselves upon the brains of the prisoners.

::Take them away! Take them to the Cavern of the Cone, and when they have suffered as much as such inferior beings are capable of suffering, thrust them into the base of the Cone!::

Chapter 16: *Cavern of the Cone*

The Gnomes had been bidden to take the prisoners to the Cavern of the Cone, but to the surprise of Sarka and Jaska, they were taken back to the Place of the Blue Light! This time the Gnomes entered the place with them, closing and securing the door behind them.

But the Place of the Blue Light had changed!

Now it had no floor of blue, as it had had before, but only a corridor perhaps wide enough to allow the passage of four grown men, walking side by side, while the abyss of which the two had got but the merest hint through the opening and closing rents filled all the center of the place!

The Gnomes seemed impervious to the unendurable heat, and these, moving together, one behind the other, one beside the other, one atop the other, formed a living wall between Sarka and Jaska and the rim of the flaming blue abyss, to protect them from the heat.

Yet through the bodies of this living wall of Gnomes, a wall which was higher than the heads of Sarka and Jaska, the heat forced its way to the prisoners, and burned them anew with its agony.

To what dread rendezvous were they going? Where, save for the few guards at the house of Luar, were the people of the Gens of Dalis? Sarka felt, somehow, that the answers to all these questions would soon be made manifest, and a feeling of exaltation he could not explain was possessing him as he advanced. Around the corridor, whose one side was the wall reaching up to invisibility, whose other side dropped off into the abyss, the Gnomes herded the prisoners.

The leader of the Gnomes was again the Gnome who had first leaped upon Jaska to examine her curiously. Now, watching the lidless eyes of this being, Sarka fancied he could detect a hint of some expression. The Gnome was excited at some prospect, some climax which they were approaching. What? On and on they moved. The blue flames from the abyss, roaring in a way that neither of the prisoners had ever experienced, reached upward in searing tongues

toward the invisible roof of this place.

Then, when they had progressed far from the door of entry, Sarka gasped at a new manifestation. Out of the abyss, some distance ahead, came a gleaming thing, something that had apparently evolved itself out of the flames of the abyss. Blue of color it was, because of the flames from the pit; but Sarka recognized it with a start which he could not suppress nor understand.

It was one of those cubes, such as he and Jaska had seen at the lip of the Moon-crater! As they approached, guided by the Gnomes, other cubes appeared out of the abyss, others in numbers swiftly augmented, until a veritable battalion of them had marshalled itself, there at the lip of the abyss.

Straight toward these cubes the Gnomes led Sarka and Jaska, and when they had reached the center of the group, they halted, forming a circle, still a wall to mask the prisoners from the heat of the abyss. The leader of the Gnomes stopped with his face, his lidless eyes, close to one of the cubes.

For a moment he paused thus, and Sarka felt sure that somehow the Gnome was holding thought converse with the cube; but, try as he might, he could find no meaning in the weird conversation for himself. It was oddly like listening to a conversation in a code beyond his knowledge.

Then the Gnome turned back to Sarka and Jaska. By a pressure of tiny feet, he tried to indicate that Sarka and Jaska should unclasp their hands. But they only clung the tighter, and now threw their arms about each other.

The Gnome desisted, much to the joy of the lovers, while Sarka studied the cubes, wondering what their mission was with Jaska and himself.

Slowly, together, the cubes began to lose their bluish glow, their cube shape—to vanish utterly.

In a trice, still locked in each other's arms, Sarka and Jaska saw the Gnomes through what appeared to be an even bluer haze. Besides, the heat of the abyss no longer tortured them, and their bodies were cooling

in a way that was unbelievably refreshing.

"What is it, beloved?" whispered Jaska. "What is it?"

Sarka stared at the Gnomes, now in retreat, capering as they had first capered when the two had fallen into their hands, toward the door by which all had entered. Mystified, Sarka put forth his hand. It came in contact with something solid, and oddly warm, which stirred an instantly responsive chord in the brain of Sarka.

This feeling was the same as he experienced when he had lifted those cubes and hurled them into the crater—where they had dissolved in falling, and instantly reappeared, each under its own Aircar!

::Jaska!:: he explained. ::Jaska! The cubes have dissolved themselves, and have reformed in the shape of a globe, as a protective covering about us, to protect us from the heat of the abyss! Apparently we are not to be killed at once! These cubes are slaves of the Gnomes, of whom Luar is ruler!::

They were indeed locked inside a globe, a globe whose integral parts were the cubes of their acquaintance; and the atmosphere of the interior was not uncomfortable, but otherwise. Sarka and Jaska were feeling normal for the first time since they had landed on the Moon. But what was the meaning of this strange imprisonment?

They were soon to know!

For the globe which enclosed them, moved to the edge of the flaming abyss, and dropped into the bluish glow! It did not drop heavily, like a falling object on Earth, but rather floated downward, right into the heart of the flames. At this new manifestation of the strangeness of science on the Moon, Sarka was at once all scientist himself, striving to find adequate answers for things which, from cause to effect, were entirely new to him. With Jaska still clasped close against him, he seated himself in the base of the globe and studied the area through which they were passing.

Blue flames which seemed to be born somewhere, an

infinite distance below them; blue flames which he knew to be the element that, shot outward from the great cone, had forced the Moon away from the Earth.

No sound of the roaring flames came through the globe, but every movement of them was visible.

Sarka turned and peered through the bottom of the globe; but all he could see below were the flames, a molten indigo lake of them. Now, as they floated downward, the glow was giving away to lighter blue, to white, almost pure white, like the radiance which covered Luar like a mantle.

Sarka felt himself on the eve of vast important discoveries, and the scientist in him made him, for the moment, almost forget the woman at his side. Jaska, unbothered about anything, now that Sarka was at her side, regarded his expression of deep concentration with a tolerant smile.

Whiter now was the light, and faster fell the globe which held the two.

The color of the globe, now fallen below the area of blue, had taken on, chameleonlike, the color of the white flames that bathed it.

Then, apparently right in the center of a lake of white flames, though Sarka could see no solid place on which the globe had landed, the globe came to rest.

Now everything was plain to see, and Sarka studied his surroundings with new interest. He felt a mounting sensation of scalp-prickling horror.

For, scattered throughout the lake of white flames, in all directions, as far as the eye could reach—standing alone, suffering untold agonies, from the expressions on their faces—were people of the Gens of Dalis!

No longer were they clothed in green and wearing on breast and back the yellow stars of their Gens. Now they were nude as they had come into the world and standing there, each was holding out hands in horror, to hold back myriads of the Gnomes, who would have forced them to submerge themselves in the white flames of the lake!

Was the Gens of Dalis being burned alive? What was the meaning of this?

For a moment, filled with horror, Sarka looked away from the spectacle. Off to his right, as he sat, he noted that the flames, which here seemed lighter than they had in high levels, were converging on a single spot toward the side of the lake of white flames—as smoke converges on the base of a chimney leading outward to the air!

He knew as he stared that he was gazing at the spot where the bluish column of the cone was born!

Shaking his head, he turned back to the mighty spectacle of this horrible thing that was being done to the people of the Gens of Dalis.

In his brain there suddenly crashed a thought whose source he could only guess at, whose meaning mystified him more than anything yet experienced. The thought might have emanated from Luar, or from Dalis. But the more he thought of the matter, the more he thought how the phrasing of the thought was

like the telepathy of Sarka the Second, now thousands of miles away, upon the Earth. And this was the thought:

::If they fight the flames, the flames will destroy them! If they go into them freely, voluntarily, they will be rendered immune to heat and to cold, to life and to death. But it is better that they die, for Earth's sake!::

What did it mean?

Sarka thought of the radiant white light which perpetually bathed the person of Luar, and thought that he had somehow been given a hint of its source. If the Gens of Dalis were voluntarily bathed in the lake of white flames, would they become as Luar?

Somehow, though he knew that such bathing would save their lives, the idea filled him anew with horror. He found himself torn between two duties. If he sent his thought out there to the Gens of Dalis, people of Earth, his people, they would be saved, but might forever become allies of the people of the Moon. If Sarka did not tell them, they would die—and there

were millions of them.

But his science had always been a science of Life, and it still was.

::Enter the flames!:: he telepathically bade his people.

::Enter the flames!::

But they did not heed him, and for the first time the atmosphere of the interior of the globe seemed filled with savage, abysmal menace! Plain to Sarka was the meaning of that menace: The cubes which composed this globe were loyal to their masters, the masters to a mistress, Luar, and would countenance no meddling.

Likewise it was impossible, if the Gnomes willed it to the cubes, for Sarka to transmit his thoughts to the Gens of Dalis through the transparent walls of the globe!

They were prisoners, indeed, of Dalis and of Luar!

But could Sarka and Jaska turn their new-found

knowledge to their own use? Sarka was thinking back, back to one of the ancient tomes of his people. It spoke, someplace, of a man who had got trapped in the heart of a seething volcano, where the heat of it had cured him of his illnesses, made him whole again, given him new youth and freshness.

But since the cubes could forestall his transmission of thought, and perhaps could read and understand thoughts, how was he to tell Jaska? How show her that a way of deliverance had been given into their hands, if they only possessed the courage to use it!

Again came that thought, which Sarka recognized as the telepathy of his father:

::Courage! You will win, and Jaska with you!::

Thoughts could come in to them then, but could not go out. Or did it mean that the cubes, or the masters of the cubes, did not care if the prisoners received messages from outside, because they knew themselves capable of frustrating anything the prisoners planned? Perhaps. More than likely that

was it.

But, looking through the bottom of the globe, into the sea of white flames below, Sarka gripped more tightly his ray director, and tried to marshal the forces of his courage. There was surely some way of escape. Some way out of their strange predicament.

Chapter 17: *Casting the Die*

Somehow Sarka believed that this white radiance of the abyss held the secret of the omnipotence of Luar, if omnipotence she possessed. That she did seemed sure, else Dalis would not have been with her. Besides, she had asked Sarka and Jaska to swear allegiance to her. Yes the secret was here, in the heart of the lake of white flames.

It might have been the Moon Fountain of Youth, or of omnipotence. There was no telling, unless Sarka tried an experiment.

His fury at Dalis now knew no bounds, and he was conscious of a desire, too poignant almost to be borne, in some way to circumvent the arch-traitor. For here in the craters of the Moon Dalis was working out a strange amplification of the scheme which he had, centuries before, proposed to Sarka the First. He was subjecting the people of his Gens to the white flames.

If they immersed themselves voluntarily, they became as Luar was, but still subservient to the will of Dalis—

and, in his hands, invincible instruments of war! Dalis had doubtless already been bathed in the flames.

Sarka was not sure, for in the home of Luar the white light was so blinding it would have been impossible to make sure that the white radiance clothed the others with Luar.

"That's it!" said Sarka to himself. "That's it! Dalis and those guards at the dais of Luar have already been subjected to the white flames! The rest who immerse themselves, voluntarily, come forth as Luar and Dalis! Who do not, die. Dalis' manner of forcing the survival of the fittest! His idea of the flood in grandfather's time, only now he causes his selection by flames instead of flood! He believes that only those worthy to survive, and to stand at his back in whatever he conceives to be his need, will guess the secret of the immersion. The others will die!"

What a terrible alternative, when Dalis could as easily have given the secret to all his people! Could have told them how to save themselves! But it was not Dalis' way. Here, in the beginning of what was to become a dual sovereignty of the Moon, Dalis had

already taken thought on the matter of over-population, and was destroying the many that the few—the strongest, most ruthless—might survive! Hundreds of thousands, millions of the Gens of Dalis, stood at the door of life, and did not know how to enter, merely because Dalis withheld the key! And, pausing in terror before the flames, they died, when a step and a plunge would have saved them all!

"If he lives to be a million, if he lives through everlasting life," said Sarka to himself, "and does penance through a thousand reincarnations, Dalis can never atone for this wholesale destruction of humanity! But I ... I wonder!"

Sarka realized the nicety of the revenge of Dalis upon Jaska and himself. Dalis had not given the secret to the prisoners, but by his use of the cubes, he had plunged them into the very heart of the horror, where they could see the suffering of the people of the Gens. Then, when they had seen and appreciated the horror of it all, they would follow the people of the Gens to death!

But Luar had spoken of thrusting them into the base of the Cone!

Then they were not for the flames after all! How could it be done? The globe composed of the cubes had but to transport the prisoners to the base of the Cone, press against that base, and open to let the prisoners free—and in the heart of the white-blue column they would be hurled outward from the Moon, into space. The mere prospect of such horror caused the perspiration to break forth anew on the body of Sarka.

But there might be a way.

"I wonder," he asked himself, "if the Earth people in *this* crater could read my thoughts in spite of their agonies, if I could get my thought to them through the globe? I wonder if, reading my thoughts, they would obey?"

Bit by bit, as parts of a puzzle fall into place, he made his plan, and his heart beat high with excitement. Jaska bent before him to look into his eyes, and he

knew that she was trying to read his face. She knew, wise Jaska, that this brilliant lover of hers was making a plan, and she believed in the sure success of it because it would be *his*!

She smiled at him, her courage high, and waited!

Holding the ray director between his body and that of Jaska, he took a terrible, ghastly chance. Dalis had known the secret sign manual of these two; but would the intelligence of the cubes comprehend it? He must take the chance, slender as it seemed. His free hand began to spell out, with all speed, the mad plan he had conceived.

[The white flames are harmless if one plunges into them voluntarily. Are you afraid to attempt it? No? Then unfasten your clothing, and have it so arranged that you can drop entirely out of it when I give you the signal, which will be a mere widening of the eyes, like this! You understand? We must go nude into the flames, so that they will bathe our whole bodies! But, when you slip out of your clothing, tear your anti-gravitational ovoid from the skull-pan of your helmet,

and hold it in your mouth! Then depend upon me, and have no fear!]

[I have no fear,] replied the fingers of Jaska. [I go to death with you if you wish—or to Life!]

Feeling the menace of the cubes almost gripping at his throat as he got into action, Sarka unfastened his own clothing, ripped the ovoid from his helmet, placed it in his mouth. Then, looking at Jaska, he gave her the signal.

Instantly, at her nod, he brought forth the ray director, pressed it with his fingers, directing its muzzle toward the curve of the globe, swinging it around in a circle, cutting out the bottom of the globe of cubes.

The action must have been one of untold surprise to the cubes which made up the globe, for before anything could be done to stay the hand of Sarka, his ray director had cut out the bottom of the globe, and Jaska and himself, divested now of all clothing, had fallen from the globe.

Unbearable heat slashed and tore at them. They still held hands, and when their feet touched upon something solid, they were gasping with the unbelievable heat; and it was ripping at their lungs like talons of white hot steel. But, pausing not at all, Sarka raced ahead with Jaska, and dived straight into the lake of white flames.

As he dived he directed his thoughts toward the people of the Gens who stood, undecided, dying by slow inches, on their little oases in the lake. And this was the thought, which was a command.

::Plunge into the flames! They will not hurt you!
Plunge in, and obey my commands, O people of the Gens of Dalis! I, Sarka, command that you obey me! Jaska, who commanded you at the will of Dalis, also commands. Gather with Jaska and me at the base of the Cone! You have but to follow the converging of the flames!::

Together the two plunged in, and it seemed all at once as though the fire had gone out of the white flames, for they were cool and soothing to the touch.

Sarka could feel new life being borne in him, could feel himself revitalized, exalted, lifted to the heights. He suddenly experienced the desire to run, and shout his joy for all to hear. But reason held him. Not thus easily would Luar and Dalis, the traitor, give over their designs against these two.

But in the heart of the flames, they dropped down, while they turned their faces toward the base of the Cone, or where they thought the base to be, even as Sarka gave another command to the now invisible people of the Gens of Dalis.

::Hold your ovoids in your mouths and follow! Obey my will!::

They dropped now to what seemed to be cool flagstones, while above them showed an orifice in a wall, into which those tongues of flame were darting. They paused there, side by side, their faces radiant, and looked back the way they had come.

Coming out of the white flames, like battalions on parade, were the people of the Gens of Dalis—scores

and hundreds of them, who had sensed and heeded the mental commands of Sarka. Like genii appearing out of the flames they came, to muster about Sarka and Jaska.

Then, when it seemed that no more were coming, Sarka turned to the base of the Cone, his face high shining with courage and confidence, and stepped straight into the flames that led into the Cone. Beside him came Jaska, while behind him came the people of the Gens of Dalis who dared to do as he had commanded.

They were sucked into the Cone like chips sucked into a whirlpool, and Sarka willed a last command as they entered:

::Quit the column at the lip of the crater, and muster about the Aircars!::

Chapter 18: *The People of Radiance*

The exaltation of Sarka knew no bounds, and looking into the eyes of Jaska, he knew she felt it, too. For her face was shining, and all of her, the wondrous shining brilliance of her, was bathed in the white radiance that mantled Luar. And now, since Jaska too knew that radiance, her beauty was greater even than that of Luar. Sarka thrilled anew at the glory of her.

But even as he stepped into the base of the Cone, he stepped out of the blue column at the lip of the Moon-crater. Swift as light, and swifter, had been the flight upward from the Cavern of the Cone; yet, so keen were his perceptions, he knew when he had passed through the chamber of the bluish glow, into which he and Jaska had first dropped upon arrival.

Now they were on the lip of the crater, and the people of the Gens who had followed him, were slipping out of the blue column, like insects out of a flame, and converging on the Aircars whose tentacles still waved as they had when Sarka had last seen them.

Sarka looked at these people in amazement. To him there was a divinity now about their nudeness which nudity never before had suggested to him. For the people shone, and there was something glorious in those divinely white bodies. They reminded Sarka of his people's books of antiquity, and his childhood's pictures of angels....

But the effect of those white flames!...

There was no explaining it. But Sarka felt that whatever he willed to do he could do; that whatever he wished for was his, whether it was his by right or no. He felt that he could move mountains, with only the aid of his hands. Looking at Jaska he conceived all sorts of new beauty in her, for she was the brightest, to him, of all the people who had passed through the lake of white flames, and been cleansed in their heat.

"No wonder Luar has mastered the Moon!" he cried to Jaska. "For when she was bathed in the white flames, her will is paramount!"

"But how, if she passes the people of the Gens of Dalis

through the flames, will she retain her sovereignty?"

"Because Dalis, too, has passed through, and his will is the will of the Gens! They will obey him, and he has sworn allegiance to Luar, or given some sort of oath of fealty!"

"How strange that but one person on the Moon has been bathed in the white flames!"

"How do we know," Sarka almost whispered it, "that she is, originally, of the Moon? Does she not look too much like our people, to be from another world entirely?"

"I do not know, but ... you mean ... you mean...?"

"I scarcely know; but Dalis would swear allegiance to no man, much less to a woman, unless he knew that man, or woman, far better than he has had opportunity, in a matter of hours only, to know Luar!"

He left it there then, as he strode boldly, with Jaska by his side, to the nearest of the Aircars.

As he approached the car, the gleam cube beneath it seemed to gleam brighter and brighter, as though it echoed the radiance of Sarka. Sarka knew, studying this phenomenon, that he possessed at least a hint of the secret of Luar's omnipotence. There had been a hint before, but by now its meaning was clearer. The white flames, out of the heart of the dying Moon, gave new life, exaltation, not only to the bodies but to the brains of those who passed through it, and with their brains quickened, they possessed such knowledge as men of Earth, for ages, had wished to possess.

Transmutation of metals ... the ability, at will, to endow the higher, more selective metals with intelligence ... and the ability to retain command of the intelligences thus endowed. This explained the power of Luar over the Gnomes, and the power of the Gnomes over the cubes—if they possessed that power.

But the Gnomes, what of them? What were they?

But for a space Sarka must await the answer to that question, for there was little time. Already he knew that the tale of his escape, and his taking over of a

portion of the Gens of Dalis, must have gone like wildfire through all the crater, and from this crater, perhaps, had been transmitted to all the craters of the Moon. All the craters....

That explained to him the absence from the lake of white flames, where he had seen so few, comparatively, of the people of Dalis' Gens. The Moon was honeycombed by such craters, and perhaps the white flame connected them all, made them all one. And Luar commanded all from her dais in this crater Sarka and his people were escaping. The millions of the Gens had been swallowed by the craters of the Moon, at command of Luar, acceded to by Dalis—and all over the Moon the very things which Sarka and Jaska had witnessed were taking place.

Even now, as Sarka raced for the Aircar, and Jaska with him, he could feel a backward pulling that was well-nigh invincible. Someone was willing him to return, willing the Gnomes to pursue him, willing the cubes to refuse obedience to him; but he laughed and stepped to the Aircar, passing by the nearest writhing tentacle as though he knew it possessed no power to

harm him. The tentacle swept aside, and did not try to bar him, while he sent his will crashing against that brightly gleaming cube. "Into the Aircar! We enter with you!"

The cube vanished instantly, and it seemed to Sarka that invisible hands caught at his feet, lifting him up through the trap-door in the belly of the Aircar, up and inside. The door swung shut, and in the forward end of the vast Aircar gleamed the cube which had obeyed his command!

Sarka sent one thought careening outward from the Aircar, a command to the cubes which stood watch beneath the other Aircars.

::Obey the Radiant People, and through them, *me!*::

The light of the cube made the interior of the Aircar as light as day, and Sarka was struck at once with another phenomenon. He could see through the sides of the car in any direction.

And what he saw filled him with a sudden fear!

Out of the crater poured myriads of the Gnomes, and up the sides of it came myriads of the gleaming cubes, all racing toward the cars.

::Get back! Get back!:: he commanded the Gnomes and the cubes.

At the same time he issued his commands to the cube within his own car, and to the cubes which by now were inside the other Aircars, realizing that the cubes themselves were the motive power of the Aircars—and that his will was the will of these individual cubes.

::Fly at once! Fly outward at top speed toward the Earth!::

Instantly, as though a single signal had started all the cars, a dozen Aircars rose majestically from the crater, while Sarka studied the Gnomes and the cubes in turmoil on the rim. He noted then, a strange circumstance: that when he commanded the Gnomes and the pursuing cubes to keep back, they hesitated, dazedly, as though they did not know whether to

advance or to retreat; that when he merely watched them, they came on.

He laughed aloud at this measuring of mental swords with Luar, and with Dalis. For he could sense the conflict very plainly. She commanded the Gnomes and the cubes to attack, he commanded them to retreat, and they remained undecided, like people drawn between two extremities, and uncertain which direction to take.

Upward, side by side now, floated the Aircars of the Moon, and in the forepeak of each, one of the gleaming cubes, like—like anti-gravitational ovoids of the Moon! At the fast falling rim of the crater boiled the Gnomes and the cubes, stirring and tumbling, hampered by their very numbers, as they tried to attack at will of Luar and retreated in confusion at the will of Sarka.

Then there was Jaska beside Sarka, her face fearful, as he pointed off across the gloomy expanse of the Moon.

From all sides, from all directions, from other craters which these two had not even seen, came scores and hundreds of the monster cars!

They had beaten Luar and Dalis but for a moment, then! Now, at her command, the countless other Aircars were coming in to head them off, to fight them back to the surface of the Moon. It would be a race against time, and against death. But of at least a dozen of the Aircars, Sarka was master, and he did not fear the issue. That strange exaltation which the white flames had given him filled him with a confidence that nothing could shake.

He shot a thought at the gleaming cube in the forepeak.

::Faster! Faster! There is no limit to your speed!
Faster! Faster! Even faster!::

Instantly the Moon seemed literally to drop away beneath the dozen Aircars which carried the Radiant People, while the Aircars of Luar and of Dalis fell hopelessly behind.

Sure that they would win in this race now, since he was just beginning to realize the vastness of his power—the all-encompassing, all-mastering power of the human mind and will, which the white flames of the Moon had made almost god-like—Sarka turned his eyes toward a coldly gleaming sphere in the star-spangled heavens ahead.

It was the Earth, and it seemed ringed in flames! From its edges there seemed to shoot long streamers of yellow or golden flames, which broke into sunlike pinwheels of radiance at their tips. Something, there on the precious Earth, was decidedly wrong!

Instantly, telepathically, he sought to gain mental contact with his father.

::Father, we are coming!:: he said, across those countless miles. ::What is happening?::

For a full minute there was no answer. Then it came, feeble, broken, weighted with fear; but it was a thought-message, unmistakably, of Sarka the Second.

::Hurry, son! Hurry! For Dalis has indeed betrayed us! I could not maintain control of the Earth with the Beryls, for some strange catastrophe has destroyed all the Beryls in the area Dalis ruled! The shifting of positions of the Earth and the Moon has so altered the relative effects of the pull of gravity exerted by the planets that Mars has been brought into dangerous proximity to us and is already so close that her ether-lights are playing over us! Surely you must be able to see them! We have received messages, but as yet I have only been partially able to decode them! What I have decoded, however, presages catastrophe—for I am sure that Mars and the Moon are in confederation, and that the Moon-people have deliberately forced us into contact with her ally!::

Cold fear clutched at the throat of Sarka as he caught the message. He decided not to tell Jaska for the moment. He looked to right and left, at the Aircars on either side of him, then issued his commands.

::Faster! Faster! Be prepared to land in the area of the Gens of Cleric, as close as possible to my laboratory!::

A strange, awesome sight, that flight of the rebels of Dalis' Gens from the Moon to the Earth—like gleaming stars across the void. Far out in Space they fled at terrific speed through almost utter darkness, but their light was still blinding, lighting the way.

Chapter 19: *Desolation*

Stranger, more thrilling even than had been the flight of the Earth after being forced out of its orbit, was the flight of those dozen Aircars of the Moon, bearing the rebels of Dalis' Gens back to Earth.

Martian fire-balls and the terrific Moon-cubes wreak tremendous destruction on helpless Earth in the final death struggle of the warring worlds.

For the light which glowed from the bodies of the rebels, which had been given them by their passage through the white flames, was transmitted to the cars themselves, so that they glowed as with an inner radiance of their own—like comets flashing across the night.

Strange alchemy, which Sarka wondered about and, wondering, looked ahead to the time when he should be able, within his laboratory, to analyze the force it embodied, and thus gain new scientific knowledge of untold value to people of the Earth.

As the cars raced across outer darkness, moving at top speed, greater than ever attained before by man, greater than even these mighty cars had traveled, Sarka looked ahead, and wondered about the fearful report his father had just given him.

That there was an alliance between Mars and the Moon seemed almost unbelievable. How had they managed the first contact, the first negotiations leading to the compact between two such alien peoples? Had there been any flights exchanged by the two worlds, surely the scientists of Earth would have known about it. But there had not, though there had been times and times when Sarka had peered closely enough at the surface of both the Moon and of Mars to see the activities, or the results of the activities, of the peoples of the two worlds.

Somehow, however, communication, if Sarka the Second had guessed correctly, had been managed between Mars and the Moon; and now that the Earth was a free flying orb the two were in alliance against it, perhaps for the same reason that the Earth had gone a-voyaging.

Side by side sat Sarka and Jaska, their eager eyes peering through the forward end of the flashing Aircar toward the Earth, growing minute by minute larger. They were able, after some hours, to make out the outlines of what had once been continents, to see the shadows in valleys which had once held the oceans of Earth....

And always, as they stared and literally willed the cubes which piloted and were the motive power of the Aircars to speed and more speed, that marvelous display of interplanetary fireworks which had aroused the concern of Sarka the Second.

What were those lights? Whence did they emanate? Sarka the Second had said that they came from Mars, yet Mars was invisible to those in the speeding Aircars, which argued that it was hidden behind the Earth. There was no way of knowing how close it was to the home of these rebels of Dalis' Gens.

And ever, as they flashed forward, Sarka was recalling that vague hint on the lips of Jaska, to the effect that Luar, for all her sovereignty of the Moon, might be,

nonetheless, a native of the Earth. But....

How? Why? When? There were no answers to any of the questions yet. If she were a native of Earth, how had she reached the Moon? When had she been sent there? Who was she? Her name, Luar, was a strange one, and Sarka studied it for many minutes, rolling the odd syllables of it over his tongue, wondering where, on the Earth, he had heard names, or words, similar to it. This produced no result, until he tried substituting various letters; then, again, adding various letters. When he achieved a certain result at last, he gasped, and his brain was a-whirl.

Luar, by the addition of the letter *n*, between the *u* and the *a*, became Lunar, meaning "of the Moon!" Yet Lunar was unmistakably a word derived from the language of the Earth! It was possible, of course, that this was mere coincidence; but, taken in connection with the suspicions of Jaska, and the incontrovertible fact that Luar resembled people of the Earth, Sarka did not believe in this particular whim of coincidence.

Who was Luar?

His mind went back to the clucking sounds which, among the Gnomes of the Moon, passed for speech. He pondered anew. He shaped his lips, as nearly as possible, to make the clucking sounds he had heard, and discovered that it was very difficult to manage the letter *n*!

The conclusion was inescapable: This woman, Luar, had once been *Lunar*, the *n*, down the centuries, being dropped because difficult for the Gnomes to pronounce.

"Yes, Jaska," he said suddenly, "somewhere on Earth, when we reach it, we may discover the secret of Luar—and know far more about Dalis than we have ever known before!"

Jaska merely smiled her inscrutable smile, and did not answer. By intuition, she already knew. Let Sarka arrive at her conclusion by scientific methods if he desired, and she would simply smile anew.

Sarka thought of the manner in which Jaska and he had been transported to the Moon; of how much Dalis

seemed to know of the secrets of the laboratory of the Sarkas. Might he not have known, two centuries ago, of the Secret Exit Dome, and somehow managed to make use of it in some ghastly experiment? And still the one question remained unanswered: Who was Luar?

The Earth was now so close that details were plainly seen. The Himalayas were out of sight, over the Earth, and by a mental command Sarka managed to change slightly the course of the dozen Aircars. By passing over the curve of the Earth at a high altitude, he hoped also to see from above something of the result of the strange aerial bombardment of which his father had spoken.

In their flight, which had been, to them a flight through the glories of a super-heavenly Universe, they had lost all count of time. Neither Sarka nor Jaska, nor yet the people in those other Aircars, could have told how long they had been flying, when, coming over the curve of the Earth, at an elevation of something like three miles, they were able at last to see into the area which had once housed the Gens of

Dalis.

A gasp of horror escaped the lips of Sarka and of Jaska.

The Gens of Dalis had occupied all the territory northward to the Pole, from a line drawn east and west through the southernmost of what had once been the Hawaiian Islands. Upon this area had struck the strange blue light from the deep Cone of the Moon.

Here, however, the light was invisible, and Sarka flew on in fear that somehow his Aircars would blunder into it, and be destroyed—for that the blue light was an agent of ghastly destruction became instantly apparent.

The dwellings of the Gens of Dalis were broken and smashed into chaotic ruins. Over all the area, and even into the area of the Gens southward of that which had been Dalis, the blind gods of destruction had practically made a clean sweep. Sarka had opportunity to thank God that, at the time the blue

column had struck the Earth, it had struck at the spot which had been almost emptied of people, and realized that blind chance had caused it. For, in order for the Gens of Dalis to be in position to launch their attack against the Moon, he had managed, by manipulating the speed of the Beryls, to bring that area into position directly opposite the Moon.

Had it been otherwise, the blue column might have struck anywhere, and wiped out millions of lives!

"God, Jaska," murmured Sarka. "Look!"

Think of a shoreline, once lined with mighty buildings, after the passage of a tidal wave greater than ever before known to man. The devastation would be indescribable. Multiply that shoreline by the vast area which had housed the Gens of Dalis, and the mental picture is almost too big to grasp. Chaos, catastrophe, approaching an infinity of destruction.

The materials of which the vast buildings, set close together, had been made, had been twisted into grotesque, nightmarish shapes, and the whole fused

into a burned and gleaming mass—which covered half of what had once been a mighty ocean—as though a bomb larger and more devastating than ever imagined of man, a bomb large enough to rock the Earth, had landed in the midst of the area once occupied by the Gens of Dalis!

Yet, Sarka knew, remembering the murmuring of the blue column as it came out of the cone, all this devastation had been caused in almost absolute silence. People could have watched and seen these deserted buildings slowly fuse together, run together as molten metal runs together, like the lava from a volcano of long ago under the ponderous moving to and fro of some invisible, juggernautlike agency.

Sarka shuddered, trying to picture in his mind the massing of the minions of Mars, who thus saw a new country given into their hands—if they could take it. Had the Earth been taken by surprise? Had Sarka the Second been able to prepare for the approaching catastrophe?

::Father,:: he sent his thoughts racing on ahead of

him, ::are those lights which are striking the Earth causing any damage?::

::Only,:: came back the instant answer, ::in that they destroy the courage of the people of the Earth! The people, however, now know that Sarka is returning, and their courage rises again! The flames are merely a hint of what faces us; but the people will rise and follow you wherever you lead!::

So, as they raced across the area of devastation, the face of Sarka became calm again. On a chance, he sent a single sentence of strange meaning to his father.

::The ruler of the Moon is a woman called Luar, which seems a contraction of Lunar!::

For many minutes Sarka the Second made no answer. When it came it startled Sarka to the depths of him, despite the fact that he had expected to be startled.

::There was a woman named Lunar!::

Chapter 20: *Sarka Commands Again*

Ahead, through the storms which still hung tenaciously to the roof of the world, flashed those dozen Aircars of the Moon. Now Sarka could plainly see the dome of his laboratory, and from the depths of him welled up that strange glow which Earthlings recognize as the joy of returning home, than which there is none, save the love for a woman, greater.

Now he could see the effect of those flares, or lights, from Mars, which impinged on the face of the Earth, though he could see no purpose in them, no reason for their being, since they seemed to do no damage at all, though the effect of them was weird in the extreme.

Outer darkness, rent with ripping, roaring storms, flurries of ice, snow and sleet, shot through and through by balls of lambent flames in unguessable numbers. Every lights which struck the surface of the Earth, bounded away and, half a mile or so from the surface again, burst into flaming pin-wheels, like skyrocketes of ancient times. Strange lights, causing

weird effects, but producing no damage at all, save to lessen to some extent the courage of Earthlings, because they did not understand these things. And always, down the ages, man had stood most in fear of the Unknown.

Sarka peered off across the heavens where a ball of flame now seemed to be rising over the horizon, and was amazed at the size of this planet. Mars was close to Earth, so close that, had they possessed Aircars like those of the Moon-people—which remained to be seen—they could easily have attacked the Earth.

Across the face of the Earth flashed those fiery will-o'-the-wisps from Mars, without rhyme or reason; yet Sarka knew positively that they possessed some meaning, and that the Earth had been forced thus close to Mars for a purpose. What that purpose was must yet be discovered.

Then, under the Aircars, the laboratory of Sarka.

Down dropped the Aircars to a landing near the laboratory, and to the cubes in the forepeak of each

Sarka sent the mental command:

::Assure yourselves that the Aircars will remain where they are! Muster inside the laboratory, keeping well away from the Master Beryl!::

Then to the people who had returned, clothed in strange radiance, from the Moon with Sarka and with Jaska he spoke:

::Leave the cars and enter my laboratory, where further orders will be given you!::

With Jaska still by his side, Sarka entered the laboratory through the Exit Dome. Inside, clothing was swiftly brought for the rebels, for Sarka and for Jaska. But, even when they were clothed, these people who had come back seemed to glow with an inner radiance which transfigured them.

Sarka the Second, his face drawn and pale, came from the Observatory to meet his son, and the two were clasped in each other's arms for a moment. Sarka the Second, who had looked no older than his

son, seemed to have aged a dozen centuries in the time Sarka had been gone.

But it was not of the threatened attack by Martians that Sarka the Second spoke. He made no statement. He merely asked a question:

"Was Lunar very beautiful, and just a bit unearthly in appearance?"

Sarka started.

"Yes. Beautiful! Wondrously, fearfully beautiful: but I had the feeling that she had no heart or soul, no conscience: that she was somehow—well, bestial!"

A moan of anguish escaped Sarka the Second.

"Dalis again!" he ejaculated. "But much of the fault was mine! Before you were born, we scientists of Earth had already several times realized the necessity of expansion for the children of Earth if they were to continue. Dalis' proposal to my father was discarded, because it involved the wholesale taking of life. But

after the oceans had been obliterated, and the human family still outgrew its bounds, Dalis came to my father and me with still another proposal. It involved a strange, other-worldly young woman whom he called Lunar! Her family—well, nothing was known about her, for her family could not be traced. Wiped out, I presume, in some inter-family quarrel, leaving her alone. Dalis found her, took an interest in her, and the very strangeness of her gave him his idea, which he brought to my father and me.

"His proposal was somewhat like that which you made when we sent the Earth out of its orbit into outer space, save that Dalis' scheme involved no such program. His was simply a proposal to somehow communicate with the Moon by the use of an interplanetary rocket that should carry a human passenger.

"He put the idea up to this girl, Lunar, and she did not seem to care one way or another. Dalis was all wrapped up in his ideas, and gave the girl the name of Lunar, as being symbolical of his plans for her. He coached and trained her against the consummation of

his plan. We knew something, theoretically at least, about the conditions on the Moon, and everything possible was done for her, to make it feasible for her to exist on the Moon. My error was in ever permitting the experiment to be made, since if I had negated the idea. Dalis would have gone no further!

"But I, too, was curious, and Lunar did not care. Well, the rocket was constructed, and shot outward into space by a series of explosions. No word was ever received from Lunar, though it was known that she landed on the Moon!

"I say no word was ever received, yet what you have intimated proves that Dalis has either been in mental communication with her, hoping to induce her to send a force against the Earth, and assist him in mastering the Earth, overthrowing we Sarkas—or has been biding his time against something of the thing we have now accomplished."

This seemed to clear up many things for Sarka, though it piled higher upon his shoulders the weight of his responsibilities. The other-worldliness of Lunar,

called now Luar, explained her mastery of the Gnomes, and through them the cubes, and her knowledge of the omnipotent qualities of the white flames of the Moon's core, which might have been, it came to Sarka in a flash, the source of all life on the Moon in the beginning!

"But father," went on Sarka, "I don't see any sense in this aerial bombardment by Mars!"

"I believe," said Sarka the Second sadly, "that before another ten hours pass we shall know the worst there is to be known: but now, son, instead of going into attack against the Moon, we go into battle against the combined forces of Mars and of the Moon!"

Sarka now took command of the forces of the Earth. Swiftly he turned to the people of the Gens of Dalis who had come back with him.

"You will be divided into eleven equal groups, as nearly as possible. Father, will you please arrange the division? Each group will be attached to the staff of one of the Spokesman of the Gens, so that each

Spokesman will have the benefit of your knowledge with reference to conditions on the Moon. Each group will re-enter its particular Aircar, retaining control of the cube in each case, of course, and will at once repair to his proper station. Telepathy is the mode of communication with the cubes, and you rule them by your will. Each group, when assembled by my father, will choose a leader before quitting this laboratory, and such leader will remain in command of his group, under the overlordship of the Spokesman to whom he reports with his group. You understand!

"Your loyalty is unquestioned. You will consecrate your lives to the welfare of the Gens to which you are going, since you no longer have a Gens of your own!"

Sarka turned to the cubes, which had formed in a line just inside the Exit Dome, and issued a mental command to the cube that had piloted his Aircar from the Moon. The cube faded out instantly, appearing immediately afterward on the table of the vari-colored lights.

"Father," said Sarka, "while I am issuing orders to the

Spokesmen, please see if you can discover the secret of these cubes: how they are actuated, the real extent of their intelligence! The rest of you, with your cubes, depart immediately and report to your new Gens!"

Within ten minutes the divisions had been made, and the Radiant People had entered the Aircars and, outside the laboratory, risen free of the Earth, and turned, each in its proper direction, for the Gens of its assignment. The Sarkas and Jaska watched them go.

There remained but one Aircar, standing outside on half a dozen of those grim tentacles, with two tentacles swinging free, undulating to and fro like serpents. Harnessed electricity actuating the tentacles—cars and tentacles subservient to the cubes.

The Aircars safely on their way, Sarka stepped to the Master Beryl, tuned it down to normal speed, and signalled the Spokesmen of the Gens.

"The Moon and Mars are in alliance against us, and Dalis has allied himself and his Gens with the ruler of

the Moon! I don't know yet what form the attack will take, but know this: that the safety of the world, of all its people, rests in your hands, and that the war into which we are going is potentially more vast than expected when this venture began, and more devastating than the fight with the Aircars of the Moon! Coming to you, in Aircars which we managed to take from the Moon-people, are such of the people of the Gens of Dalis as were able to return with me. Question them, gather all the information you can about them, and through them keep control of the cubes which pilot the Aircars, for in the cubes, I believe, lies the secret of our possible victory in the fight to come!"

Sarka scarcely knew why he had spoken the last sentence. It was as though something deep within him had risen up, commanded him to speak, and deeper yet, far back in his consciousness, was a mental picture of the devastation he had witnessed on his flight above the area that had once housed the Gens of Dalis.

For in that ghastly area, he believed, was embodied

an idea greater than mere wanton destruction, just as there was an idea back of the fiery lights from Mars greater than mere display. Somehow the two were allied, and Sarka believed that, between the blue column, and the fiery lights from Mars, the fate of the world rested.

He could, he believed, by manipulation of the Beryls that yet remained, maneuver the world away from that blue column—which on the Earth was invisible. But to have done so would have thwarted the very purpose for which this mad voyage had been begun. The world had been started on its mad journey into space for the purpose of attacking and colonizing the Moon and Mars.

The Moon had been colonized by the Gens of Dalis, already in potential revolt against the Earth. Mars was next, and by forcing the Earth into close proximity to Mars the people of the Moon had played into the hands of Earth-people—if the people of Earth were capable of carrying out the program of expansion originally proposed by Sarka!

If they were not ... well, Sarka thought somewhat grimly, the resultant cataclysmic war would at least solve the problem of over-population! Inasmuch as the Earth was already committed to whatever might transpire, Sarka believed he should take a philosophic view of the matter!

Sarka turned to an examination of the Master Beryl, and even as he peered into the depths of it, he thought gratefully how nice it was to be home again, in his own laboratory, upon the world of his nativity. He even found it within his heart to feel somewhat sorry for Dalis, and to feel ashamed that he had, even in his heart, mistreated him.

Then he thought, with a tightening of his jaw muscles, of the casual way in which Dalis had destroyed Sarka the First, of his forcing his people to undergo the terrors of the lake of white flames without telling them the simple secret; of his betrayal of the Earth in his swift alliance with Luar; or Luar herself when, as Lunar, a strange waif of Earth, Dalis had sent her out as the first human passenger aboard a rocket to the Moon. All his pity vanished, though he still believed

he had done right in sparing Dalis' life.

Suddenly there came an ominous humming in the Beryl, and simultaneously signals from the vari-colored lights on the table. Sarka whirled to the lights, noting their color, and mentally repeating the names of the Spokesmen who signalled him.

Even before he gave the signal that placed him in position to converse with them, he noted the strange coincidence. The Spokesmen who desired speech with him were tutelary heads of Gens whose borders touched the devastated area where Dalis had but recently been overlord!

An icy chill caressed his spine as he signalled the Spokesmen to speak.

"Yes, Vardee? Prull? Klaser? Cleric?"

The report of each of them was substantially the same, though couched in different words, words freighted heavily with strange terror.

"The devastated area has suddenly broken into movement! Throughout that portion of it visible from my Gens area, the fused mass of debris is bubbling, fermenting, walking into life! An aura of unearthly menace seems to flow outward from this heaving mass, and the whole is assuming a most peculiar radiance—cold gleaming, like distant starshine!"

"Wait!" replied Sarka swiftly. "Wait until the people I have sent you have arrived! Report to me instantly if the movement of the mass is noticeably augmented, and especially so if it seems to be breaking up, or coagulating into any sort of form whatever!"

Then he dimmed the lights, indicating that for the moment there was nothing more to be said. Just then his father, face very gray and very old, entered the room of the Master Beryl from the laboratory.

"Son!" he said. "The crisis is almost upon us! The Martians are coming!"

Chapter 21: *Cubes of Chaos*

Sarka raced into the Observatory, wondering as he ran how the attack of the Martians would manifest itself; but scarcely prepared for the brilliant display which greeted his gaze. Compared to the oncoming flames from Mars, the preceding display of lights had been as nothing. The whole Heavens between the Earth and Mars seemed alight with an unearthly glare, as though the very heart of the sun had burst and hurled part of its flaming mass outward into space.

On it came with unbelievable speed.

But there was no telling, yet, the form of the things which were coming.

"What are they?" whispered Jaska, standing fearlessly at Sarka's side. "Interplanetary cars? Rockets? Balls of fire? Or beings of Mars?"

"I think," said Sarka, after studying the display for a few minutes, "that they are either rockets or fireballs,

perhaps both together! But the Martians cannot consolidate any position on the Earth without coming to handgrips. Since they must know this, we can expect to see the people of Mars themselves when, or soon after, those balls of fire strike the Earth!"

Sarka raced back to the room of the Master Beryl as a strident humming came through to him.

The Spokesmen of the Gens whose borders touched those of the devastated Dalis area, were reporting again, and their voices were high pitched with fear that threatened to break the bounds of sanity.

"The ferment in the devastated area," was the gist of their report, "is assuming myriads of shapes! The fused mass has broken up into isolated masses, and each mass of itself is assuming one of the many forms!"

"What forms?" snapped Sarka. "Quickly!"

"Cubes! Thousands and millions of cubes, and the cubes themselves are forming into larger cubes, some

square, some rectangular! In the midst of these formations are others, mostly columnar, each column consisting of cubes which have coalesced into the larger form from the same small cubes! The columnar formations are topped by globes which emit an ethereal radiance!"

"Listen!" Sarka's voice was vibrant with excitement. "Spokesmen of the Gens, make sure that every individual member of your Gens is fully equipped with flying clothing including belts and ovoids—prepared for an indefinite stay outside on the roof of the world! Get your people out swiftly, keeping them in formation! Keep about you those people of Dalis whom I sent you, and understand before you break contact with your Beryls, that instructions received from these people come from me! In turn, after you have quitted the hives, anything you wish to say to me you can repeat to any one of the glowing people of Dalis!"

The contacts were broken. Sarka stared into the Beryl, glancing swiftly in all directions, to see whether his orders were obeyed.

Out of the myriads of hives were flying the people of all the Gens of Earth, their vast numbers already darkening the roof of the world. The advance fires from Mars seemed to have no effect on them, which Sarka had expected, since the fires seemed to consume nothing they had touched previously.

By millions the people came forth. People dressed in the clothing of this Gens or that, wearing each the insignia of the house of his Spokesman. A brave show. Sarka could see the faces of many, now in light, now in shadow, as the advance fires of Mars lighted them for a moment in passing, then left them in shadow as the bursting balls of fire faded and died.

Strange, too, that the fireballs made no noise. Noiseless flame which rebounded from the surface of the Earth broke in silence, deluging the heavens with shooting stars of great brilliance. Through its display flew the people of the Gens, mustering in flight above flight, each to his own level, under command of the Spokesmen of the Gens.

"How long, father," queried Sarka, "should it take to

empty the Gens areas?"

"The people of Earth have been waiting for word to go into battle since we first sent the people of Dalis against the Moon-men. They still are ready! The dwellings of our people, *all* of them, can be emptied within an hour!"

"I wonder," mused Sarka, "if that is soon enough!"

Perhaps yes, perhaps no. It would be a race, in any case. Sarka divided his attention between the rapidly changing formations of the Moon-cubes in that devastated area and the onrushing charge of the fire-balls from Mars. All were visible to him through the Master Beryl, and from the Observatory, though the Martian fire-balls were now so close that the vanguard of them could even be seen in the Master Beryl, adjusted to view only activities on the surface of the Earth.

Even as the last flights of the Gens of Earth were slipping into the icy air from the roof of the world, the Moon-cubes began their terrifying, appalling attack,

every detail of which could be seen by Sarka from the Master Beryl.

Those columns, composed of cubes, seemed to be the leaders of a vast cube-army. The top of each of them was a gleaming globe whose eery light played over the country immediately surrounding each column, their weird light reflected in the squares, rectangles and globes that other cubes had formed.

Sarka sought swiftly among the columns for the one which might conceivably be in supreme command; but even as he sought the Moon-cubes moved to the attack. The globes on the tops of the columns dimmed their lights, and the squares, rectangles and globes got instantly into terrible motion.

Southward from the position in which they had formed they began to move, the squares and rectangles apparently sliding along the surface of the scarred and broken soil, the globes rolling.

Southward there was the vast wall of the Gens that bordered the devastated area in that direction, and the

cube-army was instantly at full charge toward this, in what Sarka realized was, to be a war of demolition!

Within a minute, Sarka was conscious of a trembling of all the laboratory, and the eyes of Jaska were wide with fear. Swiftly the trembling grew, until sound now was added to the vast, awesome tremor—a vast, roaring crescendo of sound that mounted and mounted as the speed of the cube-army increased. The vanguard of the cube-army struck the dwelling of the Gens southward of that of Dalis, and a mighty, rocketing roar sounded in the Master Beryl, was audible inside the laboratory, even without the aid of the Beryl, at whose surface Sarka stared as a man fascinated, hypnotized.

The cube-army struck the dwellings, disappeared into them as though they had been composed of tissue paper, and continued on! Over the tops of the cube-army toppled the roofs of the dwellings, there, in the midst of the cubes, to be ground to powder, with a sound as of a million avalanches grinding together in some awesome, sun-size valley. Southward, in the wake of the chaotic charge, moved a mighty, gigantic

crevasse, whose sides were the walls of the hives left standing. And still the cube-army moved in, grinding everything it touched to dust, trampling buildings into nothingness, destroying utterly along a front hundreds of miles wide, and as deep as the dwellings of men!

"God!" cried Sarka, his voice so tense that both his father and Jaska heard it above the roaring which shook and rocked the world. "Do you see? The Moon-cubes are destroying the dwelling of our people, and the Martians are to destroy the people who have fled!"

"There must be a way," said Sarka the Second quietly, "to circumvent the cubes! But what? Your will still rules the cubes which piloted you from the Moon?"

"Yes," replied Sarka tersely, "but there are only a dozen of the cubes. What can they do against countless millions of them? Cubes which are Moon-cubes, brought to the Earth in the heart of that blue column, here reformed to create an army which is invincible, because it cannot be slain! It means that

the Moon-people themselves, thousands of miles out of our reach, have but to sit in comfort and watch their cube-slaves destroy us! When they have laid waste the Earth, the Martians have but to finish the fight!"

"If, beloved," said Jaska, "your will commands those twelve cubes, it can also command all the others, for they must be essentially the same. Call on the rebels of Dalis to help you!"

"Then what of the Spokesmen of the Gens, who will be out of contact with me?"

"They must stand on their own feet, must fight their own battle! Call to you the people who have passed through the white flames, and fight with the distant will of Luar and of Dalis for control of the cube-army!"

Again that exaltation, which convinced him he could move mountains with his two hands, coursed through the being of Sarka.

Quietly he answered Jaska.

"I believe you are right," he said softly. "Those of us who have passed through the flames which bore these Moon-cubes will control the cubes, even bend them to our will. The Spokesmen must vanquish the Martians or perish!"

Then he sent his mental commands to the Spokesmen:

::Meet the Martians when they arrive and destroy or drive them back! You live only if you win! We speak no more until victory is ours! People of the Gens of Dalis, go to the areas being devastated by the cubes, taking your cubes and Aircars with you, and I will join you there! *And Jaska with me!::*

Sarka had not himself mentally spoken the last four words. Jaska had thought-spoken them, before he could prevent. He turned upon her, lips shaping a command that she remain behind. But she forestalled him.

"I, too, have been through the white flames! You may have need of all of us!"

Chapter 22: *The Struggle for Mastery*

The people of all the Gens of Earth were now between two fires. The cube-army, ruled by the mistress of the Moon, was laying waste the dwellings of the Gens, destroying them with a speed and surety of which no earthquake, whatever its proportions, would have been capable. The Gens were forced out upon the roof of the world—where, scarcely had they maneuvered into their prearranged formations, than the Martians struck.

Those huge balls of fire, larger even than the Aircars of the Moon, landed in vast and awe-inspiring numbers on the roof of the world—landed easily, with no apparent effort or shock. The light of them made all the world a place of vast radiance, save only that portion which was being destroyed by the cube-army, and this area had a cold, chill radiance of its own.

By groups and organisations the fire-balls of Mars landed, and rested quiescent on the surface of the globe.

Sarka, pausing only long enough in his laboratory to study this strange attack and to discover how it would get under way, was at the same time preparing to go forth to take his own strange part in the defensive action of Earthlings. A vast confidence was in him....

"We will lose millions of people, father," he said softly. "But it will end in our victory, in the most glorious war ever fought on this Earth!"

"That is true, my son!" replied the older man sadly.

For several minutes the vast fire-balls, which seemed to be monster glowing octagons, rested where they had landed, and even then the Gens of the people were closing on them, bringing their ray directors and atom-disintegrators into action.

Then, when the Earthlings would have destroyed the first of the vast fire-balls—and Sarka was noting that the flames which bathed the balls seemed to have no effect whatever on Earthlings, save to outline them in mantles of fire—the fire-balls wakened to new life.

They opened like the halves of peaches falling apart, and out upon the roof of the world poured the first Martians Earth had ever seen!

They were more than twice the size, on the average, of Earth people, and at first glance seemed to resemble them very much, save that their eyes, of which each Martian was possessed of two, were set on the ends of long tentacles which could stretch forth to a length of two feet or more from the eye-sockets and thus be turned in any direction. Each eye was independent of its neighbor, as one could look forward while the other looked backward, or one could look right while the other looked left.

Each Martian possessed two arms on each side of a huge, powerful torso, and legs that were like the bolls of trees, compared to the slender limbs of Earthlings. All the Martians seemed to be dressed in the skins of strange, vari-colored beasts. Each carried in his upper right hand a slender canelike thing some three feet in length, from whose tip there flashed those spurts of flame which had puzzled the Earth people before the actual launching of the attack.

Beyond these weapons, the Martians seemed to possess no weapons of offense at all, nor of defense.

"With our ray directors and atom-disintegrators," said Sarka, moving into the Exit Dome with Jaska, "we can blast them from the face of the Earth!"

But in a moment he realized that he had spoken too hastily.

The nearest fire-ball was, of course, within the area of the Gens of Cleric, and Sarka could here see with his naked eyes all that transpired. The Martian passengers, who moved swiftly away from their fire-ball vehicles, then a flight of the Gens of Cleric descended upon the fireball and its fleeing passengers, with tiny ray directors and atom-disintegrators held to the fore, ready for action.

The Martians, at some distance from their glowing vehicle, paused and formed a ragged line, facing the ball, staring at the descending people of the Gens of Cleric, their tentaclelike eyes waving to and fro, oddly like the tentacles of those Aircars of the Moon.

The flight was hovering above the first fireball. In a second now, at the command of an underling, the ray directors would destroy fire-ball and Martians as thoroughly as though they had never existed at all.

But then a strange thing happened. At that exact moment, timing their actions to fractions of seconds, the Martians raised and pointed their canelike weapons of the spurting flames. They pointed them, however, not at the Earthlings, but at the fire-ball which had brought them to Earth!

Instantly the fire-ball exploded as with the roaring of a hundred mighty volcanoes—and the descending flight of the Gens of Cleric was blasted into countless fragments! Bits of them flew in all directions. Many dropped, the mangled, infinitesimal remains of them, down to the roof of Earth, while many were hurled skyward through formations above them—while those formations, to a height of a full two miles, were broken asunder. Many flights above that first flight were smashed and broken, their individual members hurled in all directions by that one single blast of a single fire-ball.

Individuals who escaped destruction were hurled end over end, upward through other flights higher above, and the whole aggregation of flights which had been concentrated on that first fire-ball was instantly demoralized, while full fifty per cent of its individuals were instantly torn to bits!

Sarka groaned to the depths of him.

"The leader of the Martians, or the master who sent them here, sent them here to win. For if they do not win, they cannot return to Mars, as they will have destroyed their vehicles! Their confidence is superhuman!"

"Have faith in the courage of Earthlings, son!" said Sarka.

It was much to ask, for if one single one of these fire-balls could wreak such havoc with the people of Earth, what would be the destruction by the countless other unexploded fireballs of the Martians?

Still, the Spokesmen themselves must discover a way

to hold their own, to win against the Martians. For Sarka there was greater work to do. He must oppose the wills of Luar and of Dalis in a mighty mental conflict, which would decide whether the homes of men would be saved, or utterly destroyed by the Moon-cubes.

But as he left through the Exit Dome, with Jaska by his side, he shuddered, and was just a little sick inside as he saw the fearful result of that first explosion of a Martian fire-ball! Bits of human wreckage were scattered over the Earth for a great distance in all directions from where the fire-ball had exploded. And at that spot a gigantic crater had been torn in the roof of the world, going down to none knew what depths.

Even the Martians, here only to consolidate positions which had passed the demolition of the Moon-cubes, were capable of demolitions almost as ghastly and complete as those of the cubes!

The sound was incapable of being described, for outside the laboratory the sound of the advance of the Moon-cubes eating into the dwellings of men,

tumbling them down, grinding them to powder, was cataclysmic in its mighty volume. A million express trains crashing head-on into walls of galvanized iron at top speed, simultaneously.

Ear-drum crashing blows as fireballs exploded. The screams and shrieks of maimed and dying Earthlings—of Earthlings unwounded but possessed of abysmal fear....

Then, resolutely, Sarka turned his back on the conflict between the Martians and the people of Earth, and hurtled across the devastated roof of the world toward that area which was feeling the destructive force of the vandal cube-army. As he flew, Jaska keeping pace with him in silence, his mind was busy.

Passage through the white flames of the Moon had given him the key. Those white flames—source of all life on the Moon—rendered almost godlike those whom it bathed ... gave them unbelievable access of mental brilliance ... were the source of that blue column which had forced the Earth outward toward Mars ... were the source, in some way, of the cubes

themselves, as he and Jaska, after passing through them, owed their now near-divinity to the same white flames! Those flames had made Luar mistress of the Moon—therefore of the Gnomes and of the cubes! Therefore, Sarka, having been bathed in the flames, should make himself master of the cubes, if he could out-will the combined determinations of Luar and of Dalis!

His confidence was supreme as he fled through outer darkness toward the eery light which came from the area of demolitions. Looking ahead, he could see tiny glows in the sky, which he knew to be the rebels of Dalis' Gens, flying to keep their rendezvous with him.

Higher mounted his courage and his confidence as he approached the roaring crash, perpetual and always mounting, which showed him where the cube-army was busiest. The sound vibrated the very air, causing the bodies of Sarka to tingle with it, causing them to flutter and shake in their flight with its awesome power. But they did not hold back, flew onward through the gloom, leaving behind them the brightly lighted areas where Gens of Earth battled with the

fireballs of the Martians, moving into the area of the eery glowing of the cubes.

Just as he approached the spot where mighty dwellings were tumbling before the march of the cube-army, he sent a single command toward the cube which had piloted him from the Moon.

::Come to me on the edge of the crevasse nearest the place of most destruction!::

Would the cube now be subservient to his will? He wondered. Everything depended upon that. If not, then he might as well try to stay the forces of a mighty avalanche with his breath, as halt the cube-army with his will.

But strangely enough, the closer he came to the vast area of tumbling dwellings the calmer he became, the more sure that he would win against the cubes.

For when he landed at the lip of the crevasse, across which he could look for a hundred miles, a single cube gleamed brightly almost at his feet, awaiting his

orders!

One by one, by twos, threes, fours, dozens, came the glowing people who had been bathed in the white flames of the Moon's life-source, and as each dropped down beside him, Sarka gave a command.

"Drop down in the midst of the cubes! Make your own cube the rallying point for this vast army of cubes, force the cubes to desist in their mighty destruction, be subservient to your will—and do you, each of you, be subservient to *my* will!"

Away dropped the rebels, glowing points of white flame, dropping down the sides of the crevasse, a mighty, awesome canyon, into the very heart of the activity of the cubes, and from the brain of Sarka, aided by the will of Jaska, went forth a simple command:

::Cease your march of destruction, O Moon-cubes, and harken to the will of Sarka, your master! Draw back from your labors, and muster, not as squares, rectangles and columns, but as individual cubes, in

the area already devastated by you! Rally about the glowing people who have passed through the flames which were your Moon-mother, and wait for orders! Take no further heed of commands from Dalis and Luar!::

Instantly it seemed to Sarka that he had drawn into some invisible vortex which tore at his brain, at his body, at his soul. Inside him a cold voice seemed to say:

::Fool, Sarka! My will is greater than yours!::

But though the force of the will of Luar, whose thought he recognized, tore at him, almost shriveled the soul and brain of him with its might, he continued to send his thought-command out to the Moon-cubes, forcing it through the wall of Luar's will, hurling it like invisible projectiles at the cube-army below.

Exultation possessed him, buoyed him up, gave him greater courage and confidence as the moments passed for even as all his being concentrated on the will-command to the cubes, his senses told him that

the mighty sound of destruction was dying away, fading out.

Slower now the dwellings fell, slower moved the Moon-cubes; and as they slowed in their mighty march through the dwellings of men, so increased the confidence, the power of will, of Sarka and his people—the rebels of the Gens of Dalis.

Then, after an hour, whose mighty mental conflict had bathed Sarka in the perspiration of superhuman effort, the sound of destruction ceased all together, and the dwellings ceased to fall.

A silent shout, like an inborn paean of rejoicing, surged through Sarka as he noted the retreat from the dwellings of men, of the Moon-cubes! Back and back retreated the squares and the rectangles, the columns and the globes, breaking apart as they retreated.

Within fifteen minutes after the destruction had ceased, millions of gleaming cubes winked upward from the bottom of the crevasse—motionless,

quiescent!

Sarka sent forth another thought.

::I am your master, O cubes of the Moon!::

No sound, no movement, answered him.

::Luar and Dalis are no longer able to command you!::

Still no sound or movement of the cubes.

Then, taking a deep breath, as of a swimmer preparing to dive into icy water, Sarka gave a new command.

::Dissolve! Reform on the roof of the world in globes! Roll over the face of the Earth, destroy the fire-balls of Mars—and take prisoners, inside the globes, the attackers from Mars!::

Instantly the gleaming cubes vanished, and darkness as of a mighty pit possessed the crevasse of destruction. Then, at the lip of the great crevasse, the

cubes swept into form—myriads of globes which gleamed with the cold blue brilliance of the Moon!

They had no sooner formed as globes than they were in action again, rolling over the roof of the world as with a rising crescendo of thunder tumbling down the night-black sky. So mighty was their rush that the roof of the world trembled and shook.

Above their charge raced Sarka and Jaska, and with them the rebels of the Gens of Dalis.

All were present when the cubes crashed into the fire-balls from Mars, swept the Martians within themselves as prisoners, held them securely—and continued on, destroying the fire-balls in myriads. Here and there fire-balls exploded on contact, destroying the globes, which immediately reformed again, as though the explosions had not been felt at all.

Sarka had won the allegiance of the Moon-cubes, which had defeated and taken prisoners the Martians, destroying the vehicles in which they might have

returned to Mars. And as realization came, darkness settled over the roof of the world; the last flare of Mars faded and died.

This done, the cubes formed in mighty rows, facing the laboratory of Sarka. His heart beating madly with exultation, Sarka studied them. Then he stepped into the Observatory, gazed away across the space which separated the Earth from the Moon, sent a mental message winging outward.

::Luar! Dalis!::

Faintly, fearfully, came the answer.

::We hear, O Sarka!::

::Shift the blue column away from the Earth! Do not interfere as we return to our orbit about the sun! Obey, or I combine the total knowledge of Mars, the Earth, and the Moon in an attack against you and your Martian ally! Inform your ally that their people will not return, that the Earth has need of them—but that two Gens of Earth will be received by Martians in

perfect amity, and these Gens allowed bidding places on Mars! Unless your ally obeys, the Martians in my hands will be destroyed!::

In an hour the answer came, the snarling thought-answer of Dalis.

::We hear! We obey! But Dalis is never beaten while he lives! His day will come!::

Sarka found himself feeling even a little sorry for sorely beaten Dalis; but his face was grim as he sent another command to the people of Dalis who had passed through the life-source of the Moon.

::Take command of the cubes, and force them to repair the damage which has been done to the dwellings of men—to repair them completely, over all the face of the Earth!::

As the glowing people hurried to obey, Sarka softly asked his father:

"But what shall we do with the Martians?"

Sarka the Second smiled.

"Release them and send them to the lowest level where, guarded by the cubes, they will be set to constructing fireballs like those in which they arrived for the use of Earth if Dalis, or the Martians, ever attack again! And, son...."

"Yes, O my father?" said Sarka softly.

"I have another suggestion for the employment of the cubes! Let them build Aircars to be used by the Gens of Prull and of Klaser, as transportation to Mars whenever you are ready for them to go!"

Sarka smiled boyishly, happily.

"Yes, O my father; and is there anything else?"

"Yes! Take Jaska as your mate! Do you not see that she is waiting for you to speak?"

Sarka turned to Jaska, whose face was glorious in her surrender, and whose lips were parted in a loving

smile—which faded only when Sarka's lips caressed it away.

#37 From An Amber Block, By Tom Curry:

A giant amber block at last gives up its living, ravenous prey.

Bigotry:

Warnings:

- - -

"These should prove especially valuable and interesting without a doubt, Marable," said the tall, slightly stooped man. He waved a long hand toward the masses of yellow brown which filled the floor of the spacious workrooms, towering almost to the skylights, high above their heads.

"Is that coal in the biggest one with the dark center?" asked an attractive young woman who stood beside the elder of the men.

"I am inclined to believe it will prove to be some sort of black liquid," said Marable, a big man of thirty-five.

There were other people about the immense rooms, the laboratories of the famous Museum of Natural History. Light streamed in from the skylights and windows; fossils of all kinds, some immense in size, were distributed about. Skilled specialists were chipping away at matrices other artists were reconstructing, doing a thousand things necessary to the work.

A hum of low talking, accompanied by the irregular tapping of chisels on stone, came to their ears, though they took no heed of this, since they worked here day after day, and it was but the usual sound of the paleontologists' laboratory.

Marable threw back his blond head. He glanced again toward the dark haired, blue eyed young woman, but when he caught her eye, he looked away and spoke to her father, Professor Young.

"I think that big one will turn out to be the largest

single piece of amber ever mined," he said. "There were many difficulties in getting it out, for the workmen seemed afraid of it, did not want to handle it for some silly reason or other."

Professor Young, curator, was an expert in his line, but young Marable had charge of these particular fossil blocks, the amber being pure because it was mixed with lignite. The particular block which held the interest of the three was a huge yellow brown mass of irregular shape. Vaguely, through the outer shell of impure amber, could be seen the heart of ink. The chunk weighed many tons, and its crate had just been removed by some workmen and was being taken away, piece by piece.

The three gazed at the immense mass, which filled the greater part of one end of the laboratory and towered almost to the skylights. It was a small mountain, compared to the size of the room, and in this case the mountain had come to man.

"Miss Betty, I think we had better begin by drawing a rough sketch of the block," said Marable.

Betty Young, daughter of the curator, nodded. She was working as assistant and secretary to Marable.

"Well—what do you think of them?"

The voice behind them caused them to turn, and they looked into the face of Andrew Leffler, the millionaire paleontologist, whose wealth and interest in the museum had made it possible for the institution to acquire the amber.

Leffler, a keen, quick moving little man, whose chin was decorated with a white Van Dyke beard, was very proud of the new acquisition.

"Everybody is talking about the big one," he continued, putting his hand on Marable's shoulder.

"Orling is coming to see, and many others. As I told you, the workmen who handled it feared the big one. There were rumors about some unknown devil which lay hidden in the inklike substance, caught there like the proverbial fly in the amber. Well, let us hope there is something good in there, something that will make worth while all our effort."

Leffler wandered away, to speak to others who inspected the amber blocks.

"Superstition is curious, isn't it?" said Marable. "How can anyone think that a fossil creature, penned in such a cell for thousands and thousands of years, could do any harm?"

Professor Young shrugged. "It is just as you say. Superstition is not reasonable. These amber blocks were mined in the Manchurian lignite deposits by Chinese workers under Japanese masters. They believe anything, the workers. I remember working once with a crew of them that thought—"

The professor stopped suddenly, for his daughter had uttered a little cry of alarm. He felt her hand upon his arm, and turned toward her.

"What is it, dear?" he asked.

She was pointing toward the biggest amber block, and her eyes were wide open and showed she had seen something, or imagined that she had seen

something, that frightened her.

Professor Young followed the direction of her finger. He saw that she was staring at the black heart of the amber block; but when he looked he could see nothing but the vague, irregular outline of the inky substance.

"What is it, dear?" asked Young again.

"I—I thought I saw it looking out, eyes that stared at us—"

The girl broke off, laughed shortly, and added, "I suppose it was Mr. Leffler's talking. There's nothing there now."

"Probably the Manchurian devil shows itself only to you," said her father jokingly. "Well, be careful, dear. If it takes a notion to jump out at you, call me and I'll exorcise it for you."

Betty blushed and laughed again. She looked at Marable, expecting to see a smile of derision on the

young man's face, but his expression was grave.

The light from above was diminishing; outside sounded the roar of home-going traffic.

"Well, we must go home," said Professor Young.

"There's a hard and interesting day ahead of us tomorrow, and I want to read Orling's new work on matrices before we begin chipping at the amber."

Young turned on his heel and strode toward the locker at the end of the room where he kept his coat and hat. Betty, about to follow him, was aware of a hand on her arm, and she turned to find Marable staring at her.

"I saw them, too," he whispered. "Could it have been just imagination? Was it some refraction of the light?"

The girl paled. "I—I don't know," she replied, in a low voice. "I thought I saw two terrible eyes glaring at me from the inky heart. But when father laughed at me, I was ashamed of myself and thought it was just my fancy."

"The center is liquid, I'm sure," said Marable. "We will find that out soon enough, when we get started."

"Anyway, you must be careful, and so must father," declared the girl.

She looked at the block again, as it towered there above them, as though she expected it to open and the monster of the workers' imagination leap out.

"Come along, Betty," called her father.

She realized then that Marable was holding her hand. She pulled away and went to join her father.

It was slow work, chipping away the matrix. Only a bit at a time could be cut into, for they came upon many insects imbedded in the amber. These small creatures proved intensely interesting to the paleontologists, for some were new to science and had to be carefully preserved for study later on.

Marable and her father labored all day. Betty, aiding them, was obviously nervous. She kept begging her

father to take care, and finally, when he stopped work and asked her what ailed her, she could not tell him.

"Be careful," she said, again and again.

Her father realized that she was afraid of the amber block, and he poked fun at her ceaselessly. Marable said nothing.

"It's getting much softer, now the outside shell is pierced," said Young, late in the day.

"Yes," said Marable, pausing in his work of chipping away a portion of matrix. "Soon we will strike the heart, and then we will find out whether we are right about it being liquid. We must make some preparations for catching it, if it proves to be so."

The light was fading. Outside, it was cold, but the laboratories were well heated by steam. Close by where they worked was a radiator, so that they had been kept warm all day.

Most of the workers in the room were making ready

to leave. Young and Marable, loath to leave such interesting material, put down their chisels last of all. Throughout the day various scientific visitors had interrupted them to inspect the immense amber block, and hear the history of it.

All day, Betty Young had stared fascinatedly at the inky center.

"I think it must have been imagination," she whispered to Marable, when Young had gone to don his coat and hat. "I saw nothing to-day."

"Nor did I," confessed Marable. "But I thought I heard dull scrapings inside the block. My brain tells me I'm an imaginative fool, that nothing could be alive inside there, but just the same, I keep thinking about those eyes we thought we saw. It shows how far the imagination will take one."

"It's getting dark, Betty," said her father. "Better not stay here in the shadows or the devil will get you. I wonder if it will be Chinese or up-to-date American!"

The girl laughed, said good night to Marable, and followed her father from the laboratory. As they crossed the threshold a stout, red-faced man in a gray uniform, a watchman's clock hanging at his side, raised his hat and smiled at the young woman and her father.

"Hello, Rooney," cried Betty.

"How d'ye do, Miss Young! Stayin' late this evenin'?"

"No, we're leaving now, Rooney. Good night."

"G' night, Miss Young. Sleep happy."

"Thanks, Rooney."

The old night watchman was a jolly fellow, and everybody liked him. He was very fond of Betty, and the young woman always passed a pleasant word with him.

Rooney entered the room where the amber blocks were. The girl walked with her father down the long

corridor. She heard Marable's step behind them.

"Wait for me a moment, father," she said.

She went back, smiling at Marable as she passed him, and entered the door, but remained in the portal and called to Rooney, who was down the laboratory.

He came hurrying to her side at her nervous hail.

"What is it, ma'am?" asked Rooney.

"You'll be careful, won't you, Rooney?" she asked in a low voice.

"Oh, yes, ma'am. I'm always careful. Nobody can get in to harm anything while Rooney's about."

"I don't mean that. I want you to be careful yourself, when you're in this room to-night."

"Why, miss, what is there to be wary of? Nothin' but some funny lookin' stones, far as I can see."

The young woman was embarrassed by her own

impalpable fears, and she took leave of Rooney and rejoined her father, determined to overcome them and dismiss them from her mind.

All the way home and during their evening meal and afterwards, Professor Young poked fun at Betty. She took it good-naturedly, and laughed to see her father in such fine humor. Professor Young was a widower, and Betty was housekeeper in their flat; though a maid did the cooking for them and cleaned the rooms, the young woman planned the meals and saw to it that everything was homelike for them.

After a pleasant evening together, reading, and discussing the new additions to the collection, they went to bed.

Betty Young slept fitfully. She was harassed by dreams, dreams of huge eyes that came closer and closer to her, that at last seemed to engulf her.

She awakened finally from a nap, and started up in her bed. The sun was up, but the clock on the bureau said it was only seven o'clock, too early to arise for

the day's work. But then the sound of the telephone bell ringing in the hall caused her to get up and don her slippers and dressing gown and hurry out into the living room.

Before she reached the phone, however, she heard her father's voice answering.

"Hello.... Yes, speaking. Good morning, Smythe."

Smythe was the janitor of the museum. Betty, standing behind her father, wondered what he could want that he should phone so early in the morning. Her father's next words sent a thrill of fright through her heart.

"My God! I—I can't believe it!" cried Young. "Is he dead?"

There was a pause; Betty caught the sound of the excited Smythe's tones through the receiver.

"Who—who is it?" she whispered, clasping her parent's arm.

"I'll be right down, yes."

Young hung up, turned to his daughter. His face was sad, heavily lined with shadows of sorrow.

"Dear, there's been a tragedy at the museum during the night. Poor Rooney has been murdered—at least so they believe—and Smythe, who found him, wants me to come down and see if anything has been stolen. I must go at once. The body is in our laboratory."

"Rooney? Ah, poor fellow."

The girl wept a little, but braced herself to assist her father.

"I'm going with you," she said.

"No, no. You'd better remain here: you can come along later," said Young. "I don't like to have you see such sights, dear. It wouldn't be good for you."

"I'll be all right. I promise you I will."

She insisted and he was forced to let her accompany him to the museum. They hailed a cab and were soon at the door. The elevator took them to the top floor, and swiftly they passed along the corridors and came to the portal which led into the rooms where the amber blocks were.

Smythe greeted them, a worried look on his seamed face. "I've sent for an ambulance, Professor," he said.

Young nodded, brushed past him, and entered the laboratory. In the morning light the amber blocks had taken on a reddish tinge. Now, they seemed to oppress the young woman, who had bravely remained at her father's side as he walked quickly to the base of the biggest block.

A vague shape lay in the shadows between the wall and the largest amber mass. Professor Young bent over the body of Rooney, and felt the pulse.

"He's been dead some time," he said.

She nodded, stricken to the heart by this terrible end

of her old friend Rooney.

"There's nothing we can do for him, now," went on her father soberly. "It looks as though he had been set upon and stabbed time after time by his assailant or assailants, whoever they were."

"How—how pale he is," said Betty. "Poor Rooney was so jolly and red-faced, but his skin is like chalk."

"And he's shrunken, too. It seems there's no blood left in his veins," said her father.

Marable, who had been called also, came in then and aided in the examination. He said good morning to Betty and her father, and then went to bend over Rooney's body.

"See the look of abject terror on his face," Betty heard Marable say to her father as the two examined the corpse. "He must have been very much afraid of whoever killed him."

"They beat him up frightfully," said Young. "There

must have been several of the assassins; it would take more than one man to do such damage."

"Yes. His ribs are crushed in—see, this gash, Professor, would be enough to cause death without any of the other wounds."

Betty Young could not take her eyes from the ghastly sight. She steeled herself to bear it, and prayed for strength that she should not faint and cause her father trouble. She could see the two men examining a large blistered area under the corpse's armpit, in the center of which was a sharp vertical slit which had without doubt punctured the artery near the surface of the axilla. Perhaps it had pierced even to the heart.

"Bloodless," exclaimed Marable, noticing the same thing as her father had spoken of. "It is as if the blood had been pumped out of his body!"

"Yes, I think it has drained out."

"There is not much of a pool here where he lies,

though," said Marable, in a low voice. "See, there are only splotches about, from various cuts he received."

"Maybe he was dragged here from another room," said Young. "When the others come, we will soon know if anything is missing. It seems that men desperate enough to commit such a murder would not leave without trying to get what they came after. Unless, of course, the killing of Rooney frightened them away before they could get their booty."

Smythe approached the group, with a physician in tow. The latter confirmed the facts which Marable and Young had found: that Rooney had been killed by the deep gash near the heart and that most of the blood was drained from the body.

"They seem like the slashes from an extremely sharp and large razor," said the medical man.

Others were coming in to look at Rooney, and the museum was buzzing with activity as various curators, alarmed about the safety of their valuable collections, feverishly examined their charges.

"He punched his clock in here at two A.M.," said Smythe. "I seen that. It's the last time he'll ever do his duty, poor feller."

"Curious odor," said the doctor, sniffing. "It smells like musk, but is fetid. I suppose it's some chemical you use."

"I noticed that, too," said Professor Young. "I don't recognize it, myself."

Marable, who had been looking at the floor between the great block of amber and the body, uttered an exclamation which caused the two men to look up.

"There are wavy lines leading around back of the block," said Marable, in answer to their questions.

The young man disappeared behind the block, and then he called to them excitedly to join him. Betty Young pressed closer, and finally slipped past the corpse and stood by her father.

Before her, she saw a large pool of black liquid. It had

been hidden by the corner of the block, so that they had not noticed it, so busy were they looking at Rooney.

And there was a great cavity in the heart of the amber block. Pieces of the yellow brown mass lay about, as though they had fallen off and allowed the inky substance to escape.

"It's hardened or dried out in the air," said Young.

"It looks like black lacquer," said Betty.

The musky smell was stronger here. The great amber block seemed to stifle them with its size.

"Our chipping and hammering and the heat of the radiator causing it to expand must have forced out the sepia, or whatever it is," said Young. There was a disappointed note in his voice "I had hoped that inside the liquid we would discover a fossil of value," he went on.

Marable looked at Betty Young. They stared at one

another for some seconds, and both knew that the same thought had occurred to the other. The frightful eyes—had they then been but figments of the imagination?

Marable began looking around carefully, here and there. Betty realized what he was doing, and she was frightened. She went to his side. "Oh, be careful," she whispered.

"The giant block has been moved a little," he replied, looking into her pretty face. "Have you noticed that?"

Now that she was told to look, she could see the extremely heavy amber block was no longer in the position it had been in. Marks on the floor showed where it had been dragged or shifted from its original resting place.

Betty Young gasped. What force could be so powerful that it could even budge so many tons? A derrick had been used, and rollers placed under the block when men had moved it.

Reason tried to assert itself. "It—it must have exploded. That would cause it to shift," she said faintly.

Marable shrugged. His examination was interrupted by the arrival of the museum's chemist, sent for by Young. The chemist took a sample of the black liquid for analysis. Reports were coming in from all over the museum, different departments declaring, one after another, that nothing had been disturbed or stolen from their sections.

Betty Young went again to Marable's side. She followed the direction of his eyes, and saw long, clawlike marks on the floor, radiating from the sepia.

"Doctor Marable," she said, "please don't—don't look any longer. Leave this terrible place for the day, anyway, until we see what happens in the next twenty-four hours."

He smiled and shook his head. "I must make a search," he replied. "My brain calls me a fool, but just the same, I'm worried."

"Do you really think ...?"

He nodded, divining her thought. The girl shivered. She felt terror mounting to her heart, and the matter-of-fact attitudes of the others in the great laboratory did not allay her fears.

Rooney's body was removed. The place was cleaned up by workmen, and Marable's search—if that was what his constant roving about the laboratory could be called—ceased for a time. The chemist's report came in. The black liquid was some sort of animal secretion, melonotic probably.

In spite of the fact that they had learned so many facts about the murder, they as yet had not solved the mystery. Who had murdered Rooney, and why? And where had his blood gone to? In no other rooms could be found any traces of a struggle.

"If you won't do anything else, please carry a gun," begged Betty of Marable. "I'm going to try to take father home, right after lunch, if he'll go. He's so stubborn. I can't make him take care. I've got to

watch him and stay beside him."

"Very well," replied Marable. "I'll get a revolver. Not that I think it would be of much use, if I did find—" He broke off, and shrugged his broad shoulders.

Leffler came storming into the room. "What's this I hear?" he cried, approaching Marable. "A watchman killed in the night? Carelessness, man, carelessness! The authorities here are absurd! They hold priceless treasures and allow thieves to enter and wreak their will. You, Marable, what's all this mean?"

Leffler was angry. Marable looked into his red face coolly. "We do the best we can, Mr. Leffler," he said. "It is unlikely that anyone would wish to steal such a thing as that block of amber."

He waved toward the giant mass.

Leffler made a gesture of impatience. "It cost me many thousands of dollars," he cried.

"It is time for lunch, Professor," said Betty.

Marable bowed to Leffler and left the millionaire sputtering away, inspecting the various specimens he had contributed.

The one o'clock gong had struck, and all the workers and investigators were leaving in paleontological laboratories for a bite to eat.

Marable, with Betty, went out last. Leffler was over in one corner of the room, hidden from their sight by a corner of an amber block. They could hear Leffler still uttering complaints about the carelessness of the men in charge of that section of the museum, and Marable smiled at Betty sadly.

"Poor Rooney," he said. "Betty, I feel more or less responsible, in a way."

"No, no," cried the girl. "How could you have foreseen such a thing?"

Marable shook his head. "Those eyes, you know. I should have taken precautions. But I had no idea it could burst from its prison so."

For the first time Marable had definitely mentioned his idea of what had occurred. The girl had understood it all along, from their broken conversation and from the look in the young scientist's eyes.

She sighed deeply. "You will get a revolver before you search further?" she said. "I'm going to. Smythe has one, and I know he'll lend it to me."

"I will," he promised. "You know, Leffler has the same idea we have, I think. That's why he keeps talking about it being our fault. I believe he has seen something, too. His talk about the devil inside the block was half in earnest. I suppose he put it down to imagination, or perhaps he did not think this fossil to be dangerous."

They went out together, and walked toward the restaurant they frequented. Her father was there, lunching with one of the superintendents of the museum. He smiled and waved to Betty.

Everyone, of course, was discussing the killing of

Rooney.

After an hour, during which the two young people spoke little, Marable and Betty Young left the restaurant and started back toward the museum. Her father was still at his table.

They walked up the driveway entrance, and then Marable uttered an exclamation. "Something's wrong," he said.

There was a small crowd of people collected on the steps. The outer doors, instead of being open as usual, were closed and guards stood peering out.

Marable and Betty were admitted, after they had pushed their way to the doors.

"Museum's closed to the public, sir," replied a guard to Marable's question.

"Why?" asked Marable.

"Somethin's happened up in the paleontological

laboratories," answered the guard. "Dunno just what, but orders come to clear the rooms and not let anybody in but members of the staff, sir."

Marable hurried forward. Betty was at his heels. "Please get yourself a gun," she said, clutching his arm and holding him back.

"All right. I'll borrow one from a guard."

He returned to the front doors, and came back, slipping a large pistol into his side pocket.

"I want you to wait here," he said.

"No. I'm going with you."

"Please," he said. "As your superior, I order you to remain downstairs."

The girl shrugged. She allowed him to climb the stairs to the first floor, and then she hurried back in search of Smythe.

Smythe obtained a gun for her, and as she did not wish to wait for the slow elevator, she ran up the steps. Smythe could not tell her definitely what had occurred in the upper laboratory that had caused the museum to be closed for the day.

Her heart beating swiftly, Betty Young hurried up the second flight of stairs to the third floor. A workman, whom the girl recognized as a manual laborer in the paleontological rooms, came running down, passing her in full flight, a look of abject terror on his face.

"What is it?" she cried.

He was so frightened he could not talk logically.

"There was a black fog—I saw a red snake with legs —"

She waited for no more. A pang of fear for the safety of Marable shot through her heart, and she forced herself on to the top floor.

Up there was a haze, faintly black, which filled the corridors. As Betty Young drew closer to the door of

the paleontological laboratories, the mist grew more opaque. It was as though a sooty fog permeated the air, and the girl could see it was pouring from the door of the laboratory in heavy coils. And her nostrils caught the strange odor of fetid musk.

She was greatly frightened; but she gripped the gun and pushed on.

Then to her ears came the sound of a scream, the terrible scream of a mortally wounded man. Instinctively she knew it was not Marable, but she feared for the young professor, and with an answering cry she rushed into the smoky atmosphere of the outer laboratories.

"Walter!" she called.

But evidently he did not hear her, for no reply came. Or was it that something had happened to him?

She paused on the threshold of the big room where were the amber blocks.

About the vast floor space stood the numerous masses of stone and amber, some covered with immense canvas shrouds which made them look like ghost hillocks in the dimness. Betty Young stood, gasping in fright, clutching the pistol in her hand, trying to catch the sounds of men in that chamber of horror.

She heard, then, a faint whimpering, and then noises which she identified in her mind as something being dragged along the marble flooring. A muffled scream, weak, reached her ears, and as she took a step forward, silence came.

She listened longer, but now the sunlight coming through the window to make murky patches in the opaque black fog was her chief sensation.

"Walter!" she called.

"Go back, Betty, go back!"

The mist seemed to muffle voices as well as obscure the vision. She advanced farther into the laboratory, trying to locate Marable. Bravely the girl pushed

toward the biggest amber block. It was here that she felt instinctively that she would find the source of danger.

"Leffler!" she heard Marable say, almost at her elbow, and the young man groaned. The girl came upon him, bending over something on the floor.

She knelt beside him, gripping his arm. Now she could see the outline of Leffler's body at her feet. The wealthy collector was doubled up on the ground, shrivelled as had been Rooney. His feet, moving as though by reflex action, patted the floor from time to time, making a curious clicking sound as the buttons of his gray spats struck the marble.

But it was obvious, even in the murky light, that Leffler was dead, that he had been sucked dry of blood.

Betty Young screamed. She could not help it. The black fog choked her and she gasped for breath. Leaving Marable, she ran toward the windows to throw them open.

The first one she tried was heavy, and she smashed the glass with the butt of the gun. She broke several panes in two of the windows, and the mist rolled out from the laboratory.

She started to return to the side of Marable. He uttered a sudden shout, and she hurried back to where she had left him, stumbling over Leffler's body, recoiling at this touch of death.

Marable was not there, but she could hear him nearby.

Cool air was rushing in from the windows, and gradually the fog was disappearing. Betty Young saw Marable now, standing nearby, staring at the bulk of an amber block which was still covered by its canvas shroud. Though not as large as the prize exhibit, this block of amber was large and filled many yards of space.

"Betty, please go outside and call some of the men," begged Marable.

But he did not look at her, and she caught his fascinated stare. Following the direction of his gaze, the girl saw that a whisp of smoky mist was curling up from under the edge of the canvas cover.

"It is there," whispered Betty.

Marable had a knife which he had picked up from a bench, and with this he began quietly to cut the canvas case of the block, keeping several feet to each side of the spot where the fog showed from beneath the shroud.

Marable cut swiftly and efficiently, though the cloth was heavy and he was forced to climb up several feet on the block to make his work effective. The girl watched, fascinated with horror and curiosity.

To their ears came a curious, sucking sound, and once a vague tentacle form showed from the bottom of the canvas.

At last Marable seized the edge of the cut he had made and, with a violent heave, sent the canvas flap

flying over the big block.

Betty Young screamed. At last she had a sight of the terrible creature which her imagination had painted in loathing and horror. A flash of brilliant scarlet, dabbled with black patches, was her impression of the beast. A head flat and reptilian, long, tubular, with movable nostrils and antennae at the end, framed two eyes which were familiar enough to her, for they were the orbs which had stared from the inside of the amber block. She had dreamed of those eyes.

But the reptile moved like a flash of red light, though she knew its bulk was great; it sprayed forth black mist from the appendages at the end of its nose, and the crumpling of canvas reached her ears as the beast endeavored to conceal itself on the opposite side of the block.

Marable had run to the other side of the mass. The air, rushing in from the windows, had cleared the mist, in spite of the new clouds the creature had emitted, and Betty could see for some feet in either direction now.

She walked, with stiff, frozen muscles, around to join Marable. As she came near to him, she saw him jerking off the entire canvas cover of the block to expose the horrible reptile to the light of day.

And now the two stood staring at the awful sight. The creature had flattened itself into the crevices and irregular surfaces of the block, but it was too large to hide in anything but a huge space. They saw before them its great bulk, bright red skin blotched with black, which rose and fell with the breathing of the reptile. Its long, powerful tail, tapering off from the fat, loathsome body, was curled around the bottom of the block.

"That's where it's been hidden, under the shroud. We've been within a few feet of it every moment we've been at work," said Marable, his voice dry. "There were many hiding places for it, but it chose the best. It came out only when there was comparative quiet, to get its food...."

"We—we must kill it," stammered the girl.

But she could not move. She was looking at the immense, cruel, lidless eyes, which balefully held her as a serpent paralyzes a bird. The tubular nostrils and antennae seemed to be sniffing at them, waving to and fro.

"See the white expanse of cornea, how large it is," whispered Marable. "The pupils are nothing but black slits now." The interest excited by this living fossil was almost enough to stifle the dread of the creature in the man.

But the girl saw the huge flat head and the crinkled tissue of the frilled mouth with its sucker disks.

Suddenly, from the central portion of the sucker-cup mouth issued a long, straight red fang.

The two drew back as the living fossil raised a short clawed leg.

"It has the thick body of an immense python and the clawed legs of a dinosaur," said Marable, speaking as though he were delivering a lecture. The sight,

without doubt, fascinated him as a scientist. He almost forgot the danger.

"Oh, it's horrible," whispered the girl.

She clung to his arm. He went on talking. "It is some sort of terrestrial octopus...."

To the girl, it seemed that the living fossil was endless in length. Coil after coil showed as the ripples passed along its body and the straight fang threatened them with destruction.

"See, it is armored," said Marable. "Betty, no one has ever had such an experience as this, seen such a sight, and lived to tell of it. It must be ravenous with hunger, shut up in its amber cell inside the black fluid. I—"

A sharp, whistling hiss interrupted his speech. The reptile was puffing and swelling, and as it grew in bulk with the intake of the air, its enamel-like scales stood out like bosses on the great body. It spat forth a cloud of black, oily mist, and Marable came to himself

at last.

He raised his revolver and fired at the creature, sending shot after shot from the heavy revolver into the head.

Betty Young screamed as the reptile reared up and made a movement toward them. Marable and the girl retreated swiftly, as the beast thumped to the floor with a thud and started at them, advancing with a queer, crawling movement.

It was between them and the door. Betty thrust her gun into Marable's hands, for his own was empty and he had hurled it at the monster.

"Hurry! Run for your life!" ordered Marable, placing himself between Betty and the reptile.

She would not leave him till he swerved to one side, going dangerously close to the beast and firing into its head. The rush of the flowing body stopped; it turned and pursued him, leaving the girl safe for the moment, but separated from Marable.

Luckily, on the smooth marble it could not get an efficient grip with its clawlike arms. It was clumsy in its gait, and for a time the man eluded it.

Betty Young, looking about for a weapon, calling for help at the top of her lungs, caught sight of a fireman's ax in a glass case on the wall. She ran over, smashed the glass with the small hammer, and took out the heavy ax.

Shot after shot reverberated through the big laboratory as Marable tried to stop the monster. Betty, bravely closing in from the rear, saw Marable leaping from side to side as the brute struck viciously at him time and again.

The creature had been emitting cloud after cloud of black fog, and the atmosphere, in spite of the open windows, was dim in its vicinity. Vaguely Betty heard shouts from the far hall, but all she could do was to call out in return and run toward the horror.

Marable, out of breath, had climbed to the top of an amber block. Betty, close by, saw the reptile rear its

bulk up into the air, until it was high enough to strike the man.

Before it could send forth its death-dealing fang to pin Marable to the block, however, Betty Young brought the ax down on its back with all her strength.

There was a sickening thud as the sharp weapon sunk deep into the fleshy back. She struck again, and the creature fell in folds, like a collapsing spring. It lashed back at her, but she leaped clear as it slashed in agony, thrashing about so that the whole room seemed to rock.

Marable came scrambling down the side of the block to help her. He was breathing hard, and she turned toward him; as Betty looked away, a portion of the scarlet tail hit her in the body and she fell, striking her head on the floor.

Marable reached down, seized the ax, and in a desperate frenzy hacked at the reptile's awful head.

[Image description start: A black and white illustration of Marable attacking the long, dragon-like monster with four legs with an ax, while Betty lies on the ground behind it. The scene is covered in smoke, and the giant block of amber looms in the background. Image description end.]

He leaped in and out like a terrier, sinking the ax deep into the neck and head of the beast. He gave the impression of slashing at heavy rubber, and Betty Young, trying to drag herself away from that

dangerous body, heard his whistling breath.

They were almost hidden from one another now, in the mist which came from the thing's nostrils.

"Help, help!" screamed the girl, mustering her last strength in the despairing cry.

She saw Marable go down, then, as the reptile hit him a glancing blow with its body. When the powerful young fellow did not rise, the girl thought it was all over. The air really became black to her; she fainted and lay still.

- - -

When Betty Young opened her eyes, the air had cleared greatly, and she could see the familiar outlines of the paleontological laboratory and the bulks of the amber blocks. Her father was holding her head in his lap, and was bathing her temples with water.

"Darling," he said, "are you badly hurt?"

"No," she murmured faintly. "I'm—I'm all right. But—but Walter—did it—"

"He's all right," said her father. "The reptile was dying, and could do him no damage. We finished it off."

Then, Marable, covered with blood, which he was trying to wipe from his hands and clothes, came and smiled down at her.

"Well," said Professor Young, "you two have mutilated a marvelous and unique specimen between you."

There were several men examining something nearby. Turning her eyes in their direction, Betty saw they were viewing the remains of the reptile.

Marable helped her to her feet, and stood with one arm about her. Professor Orling, the famous specialist on fossil reptiles, was speaking now, and the others listened.

"I think we will find it to be some sort of missing link

between the dinosaurs and mososaurs. It is surely unbelievable that such a creature should be found alive; but perhaps it can be explained. It is related to the amphibians and was able to live in or out of the water. Now, we have many instances of reptiles such as lizards and toads penned up in solid rock but surviving for hundreds of years. Evidently this great reptile went through the same sort of experience. I would say that there has been some great upheaval of nature, that the reptile was caught in its prison of amber thousands and thousands of years ago.

Through hibernation and perhaps a preservative drug it emitted in the black fluid, this creature has been able to survive its long imprisonment. Naturally, when it was released by the cutting away of part of the amber which penned it in, it burst its cell, ravenous with hunger. The fanglike tooth we see was its main weapon of attack, and it set upon the unfortunate watchman. After knocking him unconscious, its sucker-like fringe glued the mouth near the heart while the fang shot into the arteries and drew forth the body fluids. There is a great deal to be done with this valuable find, gentlemen. I would suggest that—"

Marable grunted. "Oh, hell," he murmured in Betty Young's ear. "To the devil with paleontology, Betty. You saved my life. Come out and let's get married. I love you."

The girl smiled up into his eyes. The scientists close by were listening fascinatedly to Orling's words, and had no time to watch the two young people, for they stared at the reptile's body as the great man went from section to section, lecturing upon one point after another.

"You've forgotten paleontology for a moment, thank goodness," said Betty. "I'm glad."

"Yes, Betty dear. This terrible experience has shaken me, and I realized how much I love you when I saw you in danger. What an awful few minutes! If I had to live them over again, I don't think I could face them."

"Never mind," she murmured. "We are safe, Walter. After all, it's not every woman who is helped by a living fossil to make the man she loves realize he loves her!"

#38 The Terror Of Air-level Six, By Harold Vincent Schoepflin:

From some far reach of leagueless space came a great pillar of flame to lay waste and terrorize the Earth.

Aproximate word count: 16,000

Bigotry:

Warnings:

- - -

It was a sweltering evening in mid-August, during that unprecedented heat wave which broke Weather Bureau records in 2011. New York City had simmered under a blazing sun for more than three weeks, and all who were able had deserted the city for spots of lesser torridity. But I was one of those unfortunates who could not leave on account of the pressing urgency of business matters and, there being nothing else to do, kept doggedly at my work until it seemed

that nerves and body must soon give way under the strain. To-night, as I boarded the pneumatic tube, I dropped into the nearest seat and could not even summon the energy to open my newspaper.

For some minutes I sat as in a daze, wishing merely that the journey was over, and that I was on my own front porch out in Rutherford. After awhile I stirred and looked around. Seeing none of my acquaintances in the car, I finally opened the newspaper and was considerably startled by the screaming headlines that confronted me from its usually conservative first page

SECOND COAST TRANSPORT PLANE LOST!

Disaster Like First in Air-Level Six!

No wonder the newsboys had been crying an extra on Broadway! I had given no heed to the import of their shoutings, but this was real news and well worthy of an extra edition. Since the mysterious loss of the SP-61, only four days previously, the facilities of the several air transportation systems were seriously handicapped on account of the shaken confidence of

the general public. It was not surprising that there was widespread reluctance at trusting human lives and valuable merchandise to the mercies of the inexplicable power which had apparently wiped out of existence the SP-61, together with its twenty-eight passengers and the consignment of one-half million dollars in gold. And now the NY-18 had gone the way of the other!

Details were meager. Both ships had failed to reply to the regular ten-minute radio calls from headquarters and had not since been seen or heard from. In both cases the last call had been answered when the ship was proceeding at full speed on its regular course in air-level six. The SF-61 last reported from a position over Mora in New Mexico, and four days of intensive search by thousands of planes had failed to locate ship or passengers. To-day, in the early hours of the morning, the NY-18 reported over Colorado Springs, on the northern route, and then, like the SF-61, dropped out of existence insofar as any attempts at communicating with or locating her were concerned. She, too, carried a heavy consignment of specie,

though only eleven passengers had risked the westward journey.

Someone had dropped into a seat at my side, and I looked up from my reading to meet the solemn eyes of Hartley Jones, a young friend whom I had not seen for several months.

"Why, hello, Hart," I greeted him. "Glad to see you, old man. Where in Sam Hill have you been keeping yourself?"

"Glad to see you, too, Jack," he returned warmly. "Been spending most of my time out at the hangar."

"Oh, that's right. You fellows built a new one at Newark Airport, didn't you?"

"Yeah. Got a great outfit there now, too. Why don't you drop around and see us one of these days?"

"I will, Hart, and I want you to take me up some time. You know I have never been in one of these new ships of yours. But what do you think of this mess?" I

pointed to the black headlines.

He grinned joyously and flipped back the lapel of his coat, displaying a nickeled badge. "George and I are starting out to-night to look around a little," he gloated. "Just been appointed deputy air commissioners; and we got a couple of guns on our newest plane. Air Traffic Bureau thinks there's dirty work afoot. Twelve-motored planes don't disappear without leaving a trace. Anyhow, we've got a job, and we're going to try and find out what's wrong. How'd you like to come along?"

"What?" I replied. "You know darn well I'm too busy. Besides, I'd be no good to you. Just extra load, and not pay load at that. And then, I'm broke—as usual."

Hartley Jones grinned in his engaging way. "You'd be good company," he parried; "and, what's more, I think the trip would do you a lot of good. You look all shot to pieces."

"Forget it," I laughed. "It's just the heat. And I'll have to leave you here, Hart. Drop in and see us, will you?"

The wife was asking for you only yesterday."

"Jack, dear," my wife greeted me at the door of my modest suburban home, "Mr. Preston just called, and he wants you to call him right back."

"Oh, Lord," I groaned, "can't I forget the office for one evening?" Preston was manager of the concern for which I worked.

Nevertheless, though our two fine youngsters were clamoring for their dinner, I made the telephone call at once.

"Makely," came the voice of the boss, when the connection was completed, "I want you to take the night plane for Frisco. Hate to ask you, but it must be done. Townley is sick and someone has to take those Canadian Ex. bonds out to Farnsworth. You're the only one to do it, and after you get there, you can start on that vacation you need. Take a month if you wish."

The thought of Hartley Jones' offer flashed through

my mind. "But have you read of the loss of the NY-18?" I asked Preston.

"I have, Makely. There'll be another hundred a month in your check, too, to make up for the worry of your family. But the government is sending thirty Secret Service men along on the SF-22, which leaves tonight. In addition, there will be a convoy of seven fighting planes, so there is not likely to be a repetition of the previous disasters."

That hundred a month sounded mighty good, for expenses had been mounting rapidly of late. "All right, Mr. Preston," I agreed. "I will be at the airport before midnight. But how about the bonds?"

"I'll drive around after dinner and deliver them to you. And thanks for your willingness, Makely. You'll not be sorry."

My wife had listened intently and, from my words, she knew what to expect. Her face was a tragic mask when I replaced the receiver on its hook, and my heart sank at her expression.

Then there came the ring of the telephone and, for some reason, my pulse raced as I went to the hall to answer it. Hartley Jones' cheerful voice greeted me and he was positively gleeful when I told him of my projected trip.

"Hooray!" he shouted. "But you'll not take the SF-22. You'll take the trip with me as I wanted. I tell you what: You be out at Newark Airport at eleven-thirty, but come to my hangar instead of to that of the transportation company. We'll leave at the same time as the regular liner, and we'll get your old bonds to Frisco, regardless of what might happen to the big ship. Also we might learn something mighty interesting."

I argued with him, but to no avail. And the more I argued, the greater appeal was presented by his proposition. Finally there was nothing to do but agree.

Preston arrived with the bonds shortly after the children were tucked in their beds. I did not tell him of my change in plans. He did not stay long, and I

could see that he was uncomfortable under the accusing eyes of Marie, for all his own confidence in the safety of the trip in the closely-guarded SF-22.

At precisely eleven-thirty I reached the great steel and glass hangar where Hart Jones and George Boehm carried on their experiments with super-modern types of aircraft. Hart Jones had inherited more than two million dollars, and was in a fair way to spend it all on his favorite hobby, though those who knew him best vowed that he would make many times that amount through royalties on his ever-growing number of valuable inventions.

The immense doors were open, and I gazed for the first time into the hangar whose spacious interior provided storage and manufacturing facilities for a dozen or more planes of Hart Jones' design. A curiously constructed example of his handiwork stood directly before me, and several mechanics were engaged in making it ready for flight. My friend advanced from their midst to meet me, a broad smile on his grease smeared countenance.

"Greetings, Jack," he said, taking my small bag from my hands. "Right on time, I see. And I can't tell you how glad I am that you are coming with us. So is George."

"Well, I didn't expect to," I admitted; "but there is no need of telling you that I had far rather be in your ship than in the big one."

George Boehm, the same jolly chap I had several times met in Hart's company, but fatter than ever, crawled from beneath the shiny metal body of the plane and scrambled to his feet at my side.

"Going in for a bit of adventuring, Mr. Makely?" he asked, wiping his hand with a piece of cotton waste before extending it.

"Yes," I replied, as I squeezed his chubby fingers. "Can't stick in the mud all my life, George. And I wouldn't want to be in better company for my first attempt either."

"Nor we," he returned, a mischievous twinkle in his

eyes. "Rather have a greenhorn on the Pioneer than some government agent, who'd be butting in and trying to run everything. Think you'll be scared?"

"Probably," I admitted; "but I guess I can stand it."

"Hear the latest news broadcast?" interrupted Hart Jones.

"No. What was it?" I asked.

"There has been a report from out near Cripple Creek," said Hart solemnly, "that a pillar of fire was observed in the mountains shortly after the time the NY-18 last reported. The time and the location coincide with her probable position and the report was confirmed by no less than three of the natives of that locality. Of course the statements are probably extravagant, but they claim this pillar of fire extended for miles into the heavens and was accompanied by a tremendous roaring sound that ceased abruptly as the light of the flame disappeared, leaving nothing but blackness and awe-inspiring silence behind."

"Lot of bunk!" grunted George, who was vigorously scrubbing the back of his neck.

"Sounds like a fairy tale," I commented.

"Nevertheless, there may be something in it. In fact, there must be. Three of these mountaineers observed practically the same phenomenon from quite widely separated points, though one of them said there were three pillars of fire and that these looked more like the beams of powerful search-lights. All agreed on the terrific roar. And, after all, these two liners did disappear. There must be something quite out of the ordinary about the way in which they were captured or destroyed, and this occurrence may well be supposed to have a bearing on the matter."

"Possibly they were destroyed by some freak electrical storm," I suggested.

"Where then are the wrecked vessels?" asked Hart.

"No, Jack, electrical storms do not destroy huge air liners and then suck them out into space beyond our vision. These two ships are no longer on the surface

of the earth, else they would have been long since located. The magnetic direction finders of the transportation people have covered every inch of the United States, as well as Mexico and Canada."

"Of course they might have been carried halfway around the world by a wind of unprecedented velocity." I commenced a silly argument in favor of the theory that the elements had accounted for the two vessels, but was interrupted by the mounting roar of great engines throbbing overhead.

"Hurry up there, George!" shouted Hart. "It's the SF-22 coming in. We have to be ready for the take-off in five minutes!"

He hastened to take George's place at the washbowl and all was activity within the confines of our hangar. George and I left the office and went out to the landing field, which was now brilliant with the glare of floodlights. The *Pioneer* had been trundled into the open and stood ready for the flight. Not a hundred feet above the field, the huge silver moth that was the SF-22 swept by in a wide circle that would bring her

into the wind. The roar of her engines died as she swung out of the circle of light into the surrounding darkness.

The crowds which had gathered to witness her landing buzzed with excited comment and speculation. Her nose brought slightly up, she dropped to a perfect three-point landing, the brakes screeching as she was brought to a standstill at the hangar of the transportation company.

"Come on now, you fellows," came the voice of Hart Jones from the hangar entrance, "there's no time to lose. The *Pioneer* takes off immediately after the big fellow."

We hurried to the waiting ship, which seemed like a tiny toy when compared with the giant SF-22. I had observed very little of the construction of the *Pioneer*, but I could now see that she was quite different in design from the ordinary plane. A monoplane she was, but the wing structure was abnormally short and of great thickness, and there were a number of tubes projecting from the leading edge that gave the

appearance of a battery of small cannon. The body, like all planes designed for travel in air-level six, was cigar-shaped, and had hermetically sealed ports and entrance manholes. A cluster of the cannon-shaped tubes enclosed the tail just back of the fins and rudder and, behind the wing structure atop the curved upper surface of the body, there was a sphere of gleaming metal that was probably three feet in diameter.

Before I could formulate questions regarding the unusual features of the design, we were within the *Pioneer's* cabin and Hart Jones was engaged in clamping the entrance manhole cover to its rubber seat. A throbbing roar that penetrated our double hull attracted my attention and, looking through a nearby porthole, I saw that the convoy of army planes had taken off and was circling over the SF-22 in anticipation of her start. Trim, speedy fighting ships these were, with heavy caliber machine-guns in turrets fore and aft and normally manned by crews of twelve each. The under surfaces of their bodies glistened smooth and sleek in the light from the field,

for the landing gears had been drawn within and the openings sealed by the close-fitted armor plate that protected these ordinarily vulnerable portions when in flight.

The SF-22 was ready to take off and the crowds were drawing back into the obscurity beyond the huge circle of blinding light. One after another her twelve engines sputtered into life, and ponderously she moved over the field, gathering speed as the staccato barking of the exhausts gradually blended into a smooth though deafening purr. The tail of the great vessel came up, then the wheels, and she was off into the night.

Hart Jones sat at a bewildering array of instruments that covered almost the entire forward partition of the cabin. He pressed a button and the starting motor whined for a moment. Then the single engine of the *Pioneer* coughed and roared. Slowly we taxied in the direction taken by the SF-22, whose lights were now vanishing in the darkness. I saw George open a valve on the wall and Hart stretched the fingers of his left hand to what appeared to be the keyboard of a

typewriter set into the instrument board. He pressed several of the keys and pulled back his stick. There was a whistling scream from astern and I was thrown back in my seat with painful force. With that, the motor roared into full speed and we had left the airport far behind.

"What on earth?" I gasped.

"Rocket propulsion," laughed Hart. "I should have warned you. Those tubes you saw outside at the tail and along the leading edge of the wings. Only used three of them, but that was sufficient for the take-off."

"But I thought this rocket business was not feasible on account of the wastage of fuel due to its low efficiency," I objected.

"We should worry about fuel," said Hart.

I looked about me and saw that there was very little space for the storage of this essential commodity.

"Why?" I inquired. "What fuel do you use?"

"Make our own," he replied shortly. He was busy at the moment, maneuvering the *Pioneer* into a position above and behind the SF-22 and her convoy.

"You make your own fuel enroute?" I asked in astonishment.

"Yes. That sphere you saw on top. It is the collecting end of an electrical system for extracting nitrogen and other elements, from the air. This extraction goes on constantly while we are in the atmosphere and my fuel is an extremely powerful explosive of which nitrates are the base. The supply is replenished continuously, so we have no fear of running short even in the upper levels."

George had crawled through a small opening into some inaccessible region in the stern of the vessel. I pondered over what Hart had just told me, still keeping my eyes glued to the port, through which could be seen the fleet we were following. The altimeter registered thirty-five thousand feet. We were entering air-level six—the stratosphere! Below us the troposphere, divided into five levels, each of

seven thousand feet, teemed with the life of the air. The regular lanes were filled with traffic, the lights of the speeding thousands of freight and pleasure craft moving in orderly procession along their prescribed routes.

Up here in the sixth level, which was entirely for high-speed traffic of commercial and government vessels making transcontinental or transoceanic voyages, we were the only adventurers in sight—we and the convoyed liner we were following. The speed indicator showed six hundred miles an hour, and the tiny spot of light that traveled over the chart to indicate our position showed that we were nearing Buffalo.

Glancing through one of the lower ports, I saw the lights of the city shining dimly through a light mist that fringed the shore of Lake Erie and extended northward along the Niagara. Then we were out over the lake, and the luminous hue was slipping rapidly behind. I looked ahead and saw that the distance to the SF-22 and her convoy had somewhat increased. We were a mile behind and some two thousand feet

above them. Evidently Hart was figuring on keeping at a safe distance for observation of anything that might happen.

Our motor was running smoothly and the angle of the propeller blades had been altered to take care of the change in air density from the lower altitudes. It flashed across my mind that this was an ideal location for an attack, if such was to be made on the SF-22.

Then, far ahead, I saw a beam of light stab through the darkness and strike the tossing surface of the lake. Another and another followed, and I could see that the SF-22 and her convoy were surrounded by these unearthly rays.

[Image description start: A black and white illustration of many airplanes swarming in a black sky, with three beams of light shining down from above them. Image description end.]

They converged from high above to outline a brilliant circle where they met on the surface of the waters, and in the midst of the cone formed by the beams, the liner and its seven tiny followers could be seen to falter, and huddle more closely together.

It all happened in the twinkling of an eye—so quickly, in fact, that Hart and I had not the time to exchange remarks over the strange occurrence. For a moment

the eight vessels hovered, halted suddenly by this inexplicable force from out the heavens. Then there rose from the apex of the inverted cone of light a blinding column of blue-white radiance that poured skyward an instant and was gone. To our ears came a terrific roaring that could be likened to nothing we had heard on earth. The *Pioneer* was tossed and buffeted as by a cyclone, and George came tumbling from the opening he had entered, his round face grown solemn. Then came eery silence, for the *Pioneer's* motor had gone dead. Ahead there was utter darkness. The liner and her convoy had completely vanished and the *Pioneer* was slipping into a spin!

"What's up?" asked George of Hart, who was tugging frantically at the controls.

"The liner has gone the way of the first two," he replied: "and the yarn about the pillar of fire was not so far wrong after all."

"You saw the same thing?" asked George incredulously.

"Yes, and so did Jack. There came some beams of light from the sky; then the pillar of fire and the roaring you heard, after which the vessels were gone and our electrical system paralyzed."

"Holy smoke!" ejaculated George. "What to do now?"

As he spoke, the *Pioneer* came out of the spin, and we were able to resume our positions in the seats. None of us was strapped in, and we had been clinging to whatever was handiest to keep from being tossed about in the cabin. Hart wiped his forehead and growled out an oath. The instrument board was still illuminated, for its tiny lamps were supplied with current from the storage battery. But the main lights of the cabin and the ignition system refused to function. We were gliding now, but losing altitude rapidly, having already dropped to the lower limits of level five.

"Can't you use the rocket tubes?" I inquired hesitatingly.

"They are fired in the same manner as the motor,"

replied Hart; "but we might try an emergency connection from the storage battery, which is ordinarily used only in starting and for the panel lights."

George was already fussing with the connections in a small junction box from which he had removed the cover. Meanwhile, the black waters of Lake Erie were rushing upward to meet us, and the needle of the altimeter registered twelve thousand feet.

"Here's the trouble!" shouted George, triumphantly holding up a small object he had removed from the junction box. "Ignition fuse is blown."

"Probably by some radiations from the cone of light and the column that destroyed the liner. Lucky we were no closer," were Hart's muttered comments.

George produced a spare fuse and inserted it in its proper place. The cabin lights glowed instantly and the motor started at once.

"Well, I'm going up after the generators of this

mysterious force that is destroying our cross-country ships and killing our people," asserted Hart. "The rays came from high above, but the *Pioneer* can go as high as anything that ever flew—*higher*."

He snapped a switch and a beam of light that rivalled the so-called pillar of fire bored far into the night, dimming the stars by its brilliance. Again his fingers strayed to the rows of white keys and the rocket tubes shrieked in response to his pressure. This time I was prepared for the shock of acceleration, but the action was maintained for several seconds and I found the pressure against my back growing painful. Then it was relieved, and I glanced at the altimeter. Its needle had reached the end of the scale, which was graduated to eighty thousand feet!

"Good Lord!" I exclaimed. "Do you mean to tell me that we are more than sixteen miles in the air?"

"Nearly thirty," replied Hart, pointing to another dial which I had not seen. This one was graduated in miles above sea-level, and its needle wavered between the twenty-nine and thirty mark!

Again Hart pressed the rocket buttons, and we shot still higher into the heavens. Thirty, forty, fifty miles registered the meter, and still we climbed.

"Great Scott!" blurted a voice I knew was my own, though I had no consciousness of willing the speech. "At this rate we'll reach the moon!"

"We could, if we wished," was Hart's astounding reply; "I wish you wouldn't say too much about it when we return. We have oxygen to breathe and an air-tight vessel to retain it. With the fuel we are using, we could easily do it, provided a sufficient supply were available. However, the *Pioneer* does not have large enough storage tanks as yet, and, of course, we cannot now replenish our supply with sufficient rapidity, for the atmosphere has become very rare indeed—where we are. My ultimate object, though, in building the *Pioneer*, was to construct a vessel that is capable of a trip to the moon."

"You think you could reach a great enough velocity to escape the gravitational pull of the earth?" I asked, marveling more and more at the temerity and

resourcefulness of my science-minded friend.

"Absolutely," he replied. "The speed required is less than seven miles a second, and I have calculated that the *Pioneer* can do no less than twenty."

Mentally I multiplied by sixty. I could hardly credit the result. Twelve hundred miles a minute!

"But, how about the acceleration?" I ventured. "Could the human body stand up under the strain?"

"That is the one problem remaining," he replied; "and I am now working on a method of neutralizing it. From the latest results of our experiments, George and I are certain of its feasibility."

The *Pioneer* was now losing altitude once more, and Hart played the beam of the searchlight in all directions as we descended. He and George watched through one of the floor ports and I followed suit. We were falling, unhampered by air resistance, and our bodies were practically weightless with reference to the *Pioneer*. It was a strange sensation: there was the

feeling of exhilaration one experiences when inhaling the first whiff of nitrous oxide in the dentist's chair—a feeling of absolute detachment and care-free confidence in the ultimate result of our precipitous descent.

I found considerable amusement in pushing myself from side to side of the cabin with a mere touch of a finger. There was no up nor down, and sometimes it seemed to me that we were drifting sideways, sometimes that we fell upward rather than downward. Hart and George were unconcerned. Evidently they were quite accustomed to the sensations. They bent their every energy toward discovering what had caused the disaster to the SF-22 and its convoy.

For several hours we cruised about on the strangest search ever made in the air. Alternately shooting skyward to unconscionable altitudes and dropping to levels five and six to replenish our fuel supply, we covered the greater portion of the United States before the night was over. But the powerful searchlight of the *Pioneer* failed to disclose anything

that might be remotely connected with the disappearance of the SF-22.

For me it was a never-to-be-forgotten experience. Lightning dashes from coast to coast which required but a few minutes of time—circling many miles above New York or Washington or Savannah in broad daylight with the sun low on the up-curved horizon; then shooting westward into the darkness and skirting the Pacific coast less than fifteen minutes later, but with four hours' actual time difference. Space and time were almost one.

Hart had not provided the *Pioneer* with a radio or television transmitter, but there was an excellent receiver, and, through its agency we learned that the world was in a veritable uproar over the latest visitation of the mysterious terror of the sixth air level. All commercial traffic in levels four, five and six was ordered discontinued, and the government air control stations were flashing long messages in code, the import of which could but be guessed. Vision flashes showed immense gatherings at the large airports and in the public squares of the great cities,

where the general populace become more and more excited and terrified by the awful possibilities pictured by various prominent speakers.

The governments of all foreign powers made haste to disclaim responsibility for the air attacks or for any attempt at making war on the United States. News broadcasts failed to mention Hart Jones or the *Pioneer*, since the mission had been kept secret. The phenomenon of the rays and the roaring column of light had been observed from many points on this occasion and there was no longer any doubt as to the nature of the terror as visible to the eye, though theories as to the action and source of the rays conflicted greatly and formed the basis of much heated discussion.

Eventually the advancing dawn reached San Francisco, and with its advent Hart decided to make a landing in that city so that my bonds could be delivered.

Jones was apparently a very much mystified and discouraged man. "Jack," he said, "it seems to me that

this thing is but the beginning of some tremendous campaign that is being waged against our country by a clever and powerful enemy. And I feel that our work in connection with the unraveling of the mystery and overcoming the enemy or enemies is but begun. It's a cinch that the thing is organized by human minds and is not any sort of a freak of the elements. Our work is cut out for us, all right, and I wish you would stick to George and me through the mess. Will you?"

"Sure," I agreed, readily enough. "After these bonds are delivered I am free for a month."

"Ha! Ha!" cackled George, without mirth. "A month! We're doggoned lucky if we get to the bottom of this in a year."

"Nonsense!" snapped Hart, who was considerably upset by the failure to locate the source of the disastrous rays. "There is nothing supernatural about this, and anything that can be explained on a scientific basis can be run to earth in short order. These rays are man-made and, as such, can be accounted for by man. Our greatest scientists must be

put to work on the problem at once—in fact, they have quite probably been called in by the government already."

He was maneuvering the *Pioneer* to a landing on the broad field of the San Francisco airport. Hundreds of idle planes of all sizes lined the field, and, unmindful of the earliness the hour, a great crowd was collected in expectation of sensational reports from the occupants of arriving ships. The unusual construction of the *Pioneer* attracted considerable attention and it was with difficulty that the police kept back the crowd when she rolled to a stop near the office of the local government supervisor. We hustled inside and were greeted by that official with open arms.

"Glory be!" he exclaimed. "Hart Jones and the *Pioneer*. Every airport in the land has been on the lookout for you all night. It was feared you had been lost with the SF-22 and the others. Code messages to the supervisors of all districts advised of your mission, though it has been kept out of the general news, as has the message from the enemy."

"Message from the enemy!" gasped Hart, George and I, echoing the words like parrots.

"Yes. A demand that the United States surrender, and a threat to descend into the lower levels if the demand is not complied with in twenty-four hours!"

"Who is this enemy?" asked Hart, "and where?"

"Who they are is not known," replied the official gravely; "and as to the location, the War Department is puzzled. Direction finders throughout the country took readings on the position of their radio transmitter and these readings differed widely in result. But the consensus of opinion is that the messages originate somewhere out in space, probably between fifty and one hundred thousand miles from our earth."

"Great guns!" Hart glanced at George and me, where we stood with stupidly hanging jaws. "And what does the government want of me now?"

"You are considered to be the one man who might be

able to cope with the problem, and are ordered to report to the Secretary of War, in person, immediately."

Hart was electrified into instant activity. "Here," he said in a voice of authority that commanded the official's attention and respect, "see that this package of bonds is delivered at once to the addressee and that the addressor is advised of its safe arrival. We're off at once."

Suiting action to the words, he thrust my packet into the hands of the astonished supervisor. Then, turning sharply on his heel, he flung back, "Advise the Secretary of War that I shall report to him in person in less than one hour."

As we stepped through the entrance of the *Pioneer*, he shot a final look at the official and laughed heartily at his sudden accession of energy. We had not the slightest doubt that Hart's orders would be immediately and efficiently carried out.

In precisely forty-five minutes, we stood before the

desk of Lawrence Simler, then Secretary of War, in Washington.

"You are Mr. Hartley Jones?" inquired the stern-visaged little man.

"I am, Mr. Secretary, and these are my friends and co-workers, George Boehm and John Makely."

The Secretary acknowledged the introduction gravely, then plunged into the heart of the matter at hand with the quick energy for which he was famed.

"It may or may not be a serious situation," he said, "but certainly it has thus far been quite alarming. In any event, we have taken the matter out of the hands of the Air Traffic Bureau. We are prepared to defy the ultimatum of the enemy, whoever he may be. But we want your help, Mr. Jones. Every ship of the Air Navy will be in the upper levels within the prescribed twenty-four hours, and we will endeavor to stave off their attacks until such time as you can fit the *Pioneer* for a journey to their headquarters."

"How can your antiquated war vessels, capable of hurling a high explosive shell no more than fifty miles, fight off an enemy that is thousands of miles distant?" asked Hart.

"It is believed by the research engineers of the government that, though their headquarters may be located at a great distance, the raiders drop to a comparatively low altitude at the time of one of their attacks, returning immediately thereafter to their base."

Hart Jones shook his head. "The engineers may be correct," he stated; "but how on earth can you expect a little vessel like the *Pioneer* to battle an enemy who is possessed of these terribly destructive weapons and who has sufficient confidence in his own invulnerability to declare war on the greatest country on earth?"

Secretary Simler dropped his voice to a confidential tone, and his keen gray eyes flashed excitement as he unfolded the details of the discoveries and plans of the War Department. We three listened in undisguised

amazement to a tale of the unceasing labors of our Secret Service agents in foreign countries, of elaborate experiments with deadly weapons and the chemicals of warfare.

We heard of marvelous new rays that could be projected for many miles and destroy whole armies at a single blast; rays that would, in less time than that required to tell of the feat, reduce to a mass of fused metal the greatest firstline battleships of the old days of ocean warfare. We heard of preparations for defensive warfare throughout the civilized world, preparedness that insured so terrible and final a war that it was literally impossible for a great world conflagration to again break out. We learned that the present mysterious signs of a coming war could not possibly have originated in any country on earth, else they would have been known of long in advance, due to the network of the Secret Service system. This war, so unexpectedly thrust upon us, was undoubtedly a war of planets!

"But," objected Hart, "the messages were in English, were they not?"

"They were," continued Secretary Simler, "and that puzzled our experts in the beginning. But, it may well be that our enemy from out the skies has had spies among us for many years and could thus have learned our languages and radio codes. In any event, we are to meet destructive rays with others equally destructive, and you, Hartley Jones, are the man who can make our effectiveness certain."

"I?"

"Yes. How long a time will be required in fitting out the *Pioneer* for reliable space flying?"

Hart Jones pondered the matter and I could see that he was overjoyed at the prospect of getting into the thing in earnest. "About one week," he replied, "providing you can send a force of fifty expert mechanics to my hangar at once and supply all material as fast as I shall require it."

"Excellent," said the Secretary. "We'll have the men there in a few hours and will obtain whatever you need, regardless of cost, for immediate delivery."

Incidentally, there will be several scientists as well, who will supervise the installation of two types of ray generators and their projecting mechanisms on the *Pioneer*. You will need them later."

"I don't doubt we shall," said Hart. "And now, with your permission, we shall leave for the hangar. I'm ready to start work."

"Capital!" Secretary Simler pressed every one of a row of buttons set in his desk top. We were dismissed.

"Well," said I, when we reached the outside, "he has given you quite a job, Hart!"

"You said something," he replied. "But, if this threat from the skies proves as real and as calamitous as I think it will, we all have our work cut out for us."

"Do you really believe this enemy comes from another planet?" asked George as we entered the *Pioneer* for the trip home.

"Where else can they be from?" countered Hart. "But,

really it makes no difference to us now. We have to go after them in earnest. Don't want to quit, do you, George?"

"Wha-a-at?" shouted George, as he jerked savagely at the main switch of the *Pioneer*. "You know me better than that, Hart. Did I ever let you down in anything?"

"No," admitted the smiling Hart, "you never did, bless your heart. But Jack here is another matter. He has a wife and two kids to look after. That lets him out automatically."

My heart sank at the words, for I knew that he meant what he said. And, truth to tell, I saw the justice in his remarks.

"But, Hart," I faltered, "I'd like to be in on this thing."

"I know you would, old man. But I think it's out of the question, for the present at least. You can help with the reconstruction of the *Pioneer*, however."

And meekly I accepted his dictum, though with

secretly conflicting emotions. Little did I realize at the time that Hart knew far more than he pretended and that he had merely attempted to salve his own conscience in this manner.

I was very anxious to return to my family, and, as I sped homeward in a taxicab after the *Pioneer* landed at her own hangar, my mind was filled with doubts and fears. Secretary Simler had been very brief in his talk, but his every word carried home the gravity of the situation. What if these invaders carried the war to the surface? Suppose they seared the countryside and the cities and suburbs with rays of horrible nature that would shrivel and blast all that lay in their path? My heart chilled at the thought and it was a distinct relief when I gazed on my little home and saw that it was safe—so far. I paid the driver with a much too large bank note and dashed up my own front steps two at a time.

A few hours later I tore myself away and returned to the hangar, where the *Pioneer* now reposed in a scaffolded cradle. The sight which met my eyes was astonishing in the extreme, for the hangar had been

transformed into a huge workshop with seemingly hundreds of men already at work. It was a scene of furious activity, and, to my utter amazement, I observed that the *Pioneer* was already in an advanced stage of disassembly.

I had no difficulty in locating Hart Jones, for he was striding from lathe to workbench to boring mill, issuing his orders with the sureness and decision of a born leader of men. He welcomed me in his most brisk manner and immediately assigned me to a portion of the work in the chemical laboratory—something I was at least partly fitted for.

We labored far into the night, when a siren called us to rest and food. This was to be a night and day job, and not a man of those on duty gave thought to the intense nervous and physical strain. Sixty-five of us I learned there were, though it had seemed there were several times that number.

During the rest period, Hart switched on the large television and sound mechanism of the public news broadcasts. Great excitement prevailed throughout

the United States, for there had been a leak and the news had gone abroad regarding the message from the enemy. There was widespread panic and disorder and the government was besieged with demands for authentic news. The twenty-four hours of grace had nearly expired.

Finally the public was told of what actually was happening. Our entire fleet of one thousand air cruisers was in air-level six, waiting for the enemy. America was going to fight in earnest!

Flashes of our air cruisers in construction and in action came over the screen; voice-vision records of the popular officers of the fleet followed in quick succession. Then came the blow—the first of the strange war.

Two vessels of the air fleet had been destroyed by the triple rays and pillar of fire! Fifty cruisers rushing to the scene had been unable to find any traces of the source of the deadly rays. And, this time, there was an alarming added element. The pillar of fire had risen from a point near Gadsden in Alabama and, in its

wake, there spread a sulphurous, smoldering fire that crept along the ground and destroyed all in its path. Farms, factories, and even the steel rails of the railroads were consumed and burned into the ground as if by the breath of some tremendous blast furnace. Hundreds of inhabitants of the section perished, and it was reported that the fumes from the strange fires were drifting in the direction of Birmingham, terrifyingly visible in blue-green clouds of searing vapor.

With the first news of the disaster came a wave of fear that spread over the country with the rapidity of the ether waves that carried the news. Then came stern determination. This enemy must be swept from the skies! Gatherings in public places volunteered en masse for whatever service the government might ask of them. The entire world was in an uproar, and from Great Britain, France, Germany and Russia, came immediate offers of their air fleets to assist in fighting off the Terror.

In less than an hour there were nearly five thousand cruisers in air-level six, patrolling its entire depth from

thirty-five thousand to one hundred thousand feet altitude.

We resumed work in the hangar, but the news service was kept in operation as far as the amplifiers were concerned, though the television screen was switched off on account of the likelihood of its distracting the workers.

Again came the report of a major disaster, this time over Butte in Montana. Four American vessels and one British were the victims in level six. And the city of Butte was in flames; blue, horrible flames that literally melted the city into the ground. Again there was no trace of the invaders.

How puny were the efforts of the five thousand air cruisers! Marvels of engineering and mechanical skill, these vessels were. Deadly as were the weapons they carried—weapons so terrible that war on earth was considered impossible since their development—they were helpless against an enemy who could not be located. Though our vessels were capable of boring high into the stratosphere, the enemy worked from

still higher.

"Holy smoke!" gasped Hart Jones, who had stopped at my side. "What a contract I have on my hands!"

He looked in the direction of the partly dismantled *Pioneer*, and I could see by the fixedness of his stare that he was thinking of her insignificant size in comparison with the job she was to undertake.

Above the din of the machines in the hangar rang the startled voice of a news announcer. Panic-stricken he seemed, and we stopped to listen. Another blow of the terror of the skies—and now close by! Over Westchester County in New York State there was a repetition of the previous attacks. Only two of the cruisers had vanished this time; but several towns, including Larchmont and Scarsdale, were pools of molten fire!

Sick at heart, I thought of my little home in Rutherford and of the dear ones it contained. I thought of telephoning, but, what was the use? There was no warding off of this terrible thing that had so

suddenly come to our portion of the world. It was the blowing of the last trumpet, the way things looked.

The announcer had calmed himself. His voice droned tonelessly now, as was the custom. Another raid, on the Mexican Border now. We were stupefied by the rapidity of the enemy's attacks; then electrified once more by the most astounding news of all. Alexandria, in Egypt, was the base of a pillar of fire! Fully half of the city was wiped out, and the remainder in a mortal funk, terrorized and riotous. The United States was not alone in the war!

The foreign fleets which reinforced our own were ordered home immediately. But to what avail? The world was doomed!

In the morning, after nine fearful attacks during the night, there came another message from the enemy and this was repeated in five languages and addressed to the entire world:

"People of Earth," it read, "this is our final warning. One chance has been given and you have proved

stubborn. Consider well that your civilization be not entirely destroyed, and answer as the expiration of forty-eight hours, using our transmitting frequency. Our hand is to be withheld for that period only, when, unless our demands are met, all of your large cities and towns will be destroyed. Our terms for peace are that we be permitted to land without resistance on your part; that you surrender farm and forest lands, cities and towns, able-bodied men of twenty to forty, selected women of seventeen to thirty, and tribute in the form of such supplies and precious metals as we may specify, all to the extent of forty per cent of your resources. No compromise will be accepted."

That was all. It was during a rest period at the Jones hangar and I had brought Hart and George to my home for breakfast. We sat at the table when the news instrument brought the message. Marie was pouring the coffee, and my two small boys, Jim and Jack, had gone to the playroom, from whence their joyous voices could be heard. We four were struck dumb at the announcement, and Marie looked at me with so awful an expression of dread that my coffee

turned bitter in my mouth. Marie was just twenty-eight!

"What beasts!" cried Hart. "Allow them to land without resistance? I should say not! Rather we should fight them off until all of us perish."

He had risen from his chair in his anger. Now he sat down suddenly and shook a forefinger in my face.

"Say!" he exploded. "You can't tell me that some master mind of our own world is not back of this!"

"I'm not telling you," I replied, startled at the fierce fire that flashed from his eyes.

"I know. I'm just trying to think aloud and I'm liable to say anything. But this sort of business is the work of humans as sure as you're born. Still I believe that what Simler says is true. I can't believe that any country on earth is back of the thing. It must be an attack from beings of another planet, but I think they have as a leader a man who is of our own earth."

Marie's eyes opened wide at this. "But how could that be?" she asked. "Surely no one from our earth has made the trip to one of the other planets?"

"It may be that someone has," replied Hart. "Do you remember Professor Oradel? Remember, about ten years ago, I think it was, when he and a half dozen or more of extremely radical scientists built a rocket they claimed would reach the moon? They were ridiculed and hissed and relegated to the position of half-baked, crazy inventors. But Oradel had a large private fortune, and he and his crowd built themselves a workshop and laboratory in a secluded region in the Ozarks. Here they labored and experimented and eventually the rocket ship was constructed. No person was in their confidence, but when the machine was completed they issued a statement to the press to the effect that they were ready for the voyage to the moon, and that, when they returned, a reckoning with the world was to be made for its disbelief and total lack of sympathy. Again the press subjected Oradel to a series of scathing denunciations, and the scientific publications refused

to take cognizance of his claims in any way, shape or form."

"Then, one night, a great rocket roared into the heavens, leaving a terror-stricken countryside in the wake of its brilliantly visible tail. Several observatories whose telescopes picked up and followed the trail of the contraption reported that it described a huge parabola, mounting high into the stratosphere and falling back to earth, where it was lost in the depths of the Pacific Ocean. There the thing ended and it was soon forgotten. But I believe that this rocket ship of Oradel's reached Mars or Venus and that the peoples of whichever planet they reached have been prevailed upon and prepared to war upon the world."

"That would explain their knowledge of our languages and codes." I ventured, "and would likewise account for the fact that the first of our ships to be attacked were those carrying large shipments of currency. Though if these were destroyed by the fire columns, I can not see what good the money would do them."

"Don't believe the first three were destroyed," grunted Hart. "You'll remember that in these cases the pillars of fire, or whatever you want to call them, were of a cold light, whereas now they are viciously hot and leave behind them the terrible destructive fires that spread and spread and seemingly never are extinguished. No, I think that the force used is something of the nature of an atom-disrupting triad of beams and that these set up the column as a veritable tornado, a whirling column of roaring wind rushing skyward with tremendous velocity. The first ships, I believe, were carried into the stratosphere and captured intact by the enemy.

"Since the declaration of war the nature of the column has altered. The three beams, instead of meeting at or near the surface of the earth, now join high in the heavens and the column strikes downward instead of expending its force upward. An added energy is used which produces the terribly destructive force below. And now we are able to locate fragments of the ships destroyed above, whereas previously there were no traces."

"Sounds reasonable," commented George. "But why have they not landed and waged their war right here without warning, if that is what they now intend to do?"

"A natural question, George. But I have a hunch that the space flier or fliers of the enemy are conserving fuel by remaining beyond gravity. You know, in space flying, the greatest expenditures of energy are in leaving or landing on a body and, once landed, they might not have sufficient fuel for a getaway. They know we are not exactly helpless, once they are in our midst, and are taking this means of reducing us to the point of complete subjection before risking their precious selves among us."

The telephone startled us by its insistent ring. It was a call from the hangar for Hart. The news broadcast announcer was in the midst of a long dissertation regarding the discovery only this morning that there were certain apparent discrepancies in the movements of the tides and unwonted perturbations of the moon's orbit. There flashed on the screen a view of the great observatory at Mount Wilson, and

Professor Laughlin of that institution stepped into the foreground of the scene to take up the discussion so mechanically repeated by the announcer.

"Must leave for the hangar at once," declared Hart, returning from the telephone. "Simler and his staff are there and we are wanted immediately."

"Oh, Jack!" Marie begged with her eyes.

"Got to be done, Honey," I responded, "and, believe me, I am going to do what little I can to help. Suppose we surrendered!"

I shuddered anew at the very thought and took hurried leave of my family, Hart and George awaiting me in the hall. Had I known what was to transpire before the end of the war, I am certain I would have been in much less of a hurry.

We rushed to the hangar, where Secretary Simler and his party awaited us in the office. Rather, I should say, they waited for Hart Jones.

"Mr. Jones," said the Secretary of War, when the introductions were over, "it is up to you to get the *Pioneer* in shape to go out after these terrible creatures before the forty-eight hours have expired. We have replied to their ultimatum and have told them we will have our answer ready within the appointed time, but it is already agreed between the nations of the World Alliance that our reply is to be negative. Better far that we submit to the utter destruction of our civilization than agree to their terms."

"I believe I can do it, Mr. Secretary," was Hart Jones' simple comment. "At least I will try. But you must let me have an experienced astronomer at once with whom to consult."

"Astronomer?"

"Yes—immediately. I have a theory, but am not enough of a student of astronomy myself to work it out."

"You shall have the best man in the Air Naval Observatory at once." Secretary Simler chewed his

cigar savagely. "And anything else you might need," he concluded.

"There is nothing else, sir." Hart turned from the great men who regarded him solemnly, some with expressions of hope, others with plain distrust written large on their countenances.

They left in silence and we returned to our work with renewed vigor. Within an hour there arrived by fast plane an undersized, thick-spectacled man who presented himself as Professor Linguist from the government observatory. He was immediately taken into the office by Hart and the two remained behind closed doors for the best part of four hours.

Meanwhile the hangar hummed with activity as usual. We in the chemical laboratory were engaged in compounding the high explosive used as fuel in the *Pioneer*. This was being compressed to its absolute limit and was stored in long steel cylinders in the form of a liquid of extremely low temperature. These cylinders were at once transferred to a special steel vault where the temperature was kept at a low

enough point to prevent expansion and consequent loss of the explosive, not to speak of the danger of destroying the entire lot of us in its escape.

The generating apparatus of the *Pioneer* was to be dispensed with for this trip, since it was of no value outside the atmosphere where there was no air from which to extract the elements necessary for the production of the explosive. Instead, the entire supply of fuel for the trip was to be carried aboard the vessel in the cylinders we were engaged in filling. Hart had calculated that there was just sufficient room to store fuel for a trip of about two hundred thousand miles from the earth and a safe return. We hoped this would be enough.

On the scaffolding around the *Pioneer* there were now so many workers that it seemed they must forever be in one another's way. But the work was progressing with extreme rapidity. Already there projected from her blunt nose a slender rod of shining metal which was the projector of one of the destructive rays whose generator and auxiliaries were being installed under the supervision of the government experts. The force

had been trebled and was now working in shifts of two hours each, the pace being so exhausting that highest efficiency was obtained by using these short periods.

Additional rocket tubes were being installed, and the steel framework of a bulge now showed on the hull, this bulge being an additional fuel storage compartment that would provide a slight additional resistance and consequently lower speed in the lower levels, but would prove little hindrance in level six and none at all in outer space.

When Hart emerged from his office he appeared to be very tired, indeed, but his face bore an expression of triumph that could not be mistaken. He and this little scientist from Washington had evidently arrived at some momentous conclusion regarding the enemy.

"Jack," he said, when he reached my bench during his first round of the hanger, "celestial mechanics is a wonderful thing. I had a hunch, and this astronomer chap has proved it correct with his mathematics. Our friend the enemy is out there in space at a point

where his own mass and velocity are exactly counteracted by those of the earth and its satellite, the moon. He is just floating around in space, doing no work whatsoever to maintain his own position. He has temporarily assumed the rôle of a second satellite to us and is revolving around us at a definite period that was calculated by Lindquist. The gravitational pull of the moon keeps him from falling to the earth and that of the earth keeps him from approaching the moon. The resultant of the set of forces is what determines his orbit and the disturbance in the normal balance is what has been observed by the astronomers who reported changes in the tides and in the moon's orbit."

"But Lindquist's figures prove that the vessel or fleet of the enemy must be of tremendous size to produce such discrepancies, infinitesimally small though they might seem. We have a big fellow with whom to deal, but we know where to find him now."

"How can he work from a fixed position to make his attacks on the earth at such widely separated points?" I asked.

"It isn't a fixed position in the first place, and besides the earth rotates once in twenty-four hours, while the moon travels around the earth once in about twenty-eight days. But, even so, the widespread destruction could not be accounted for. He must send out scouting parties or something of that sort. That is one of the things we are to learn when we get out there. We'll have some fun, Jack."

"Will the *Pioneer* be ready?" I asked. Evidently I was to go.

"She will, with the exception of the acceleration neutralizers. But I'm having some heavily-cushioned and elastic supports made that will, I believe, save us from injury. And I guess we can stand the discomfort for once."

"Yes," I agreed, "in such a cause, I, for one, am willing to go through anything to help keep this overwhelming disaster from our good old world."

"Jack," he whispered, "we must prevent it. We've got to!"

Then he was gone, and I watched him for a moment as he dashed headlong from one task to another. He was a whirlwind of energy once more.

Forty-three hours and twenty minutes had passed since the receipt of the enemy's ultimatum. The last bolt was being tightened in the remodeled *Pioneer*, and Secretary Simler and his staff were on hand to witness the take-off of the vessel on which the hopes of the world were pinned. The news of our attempt had been spread by cable and printed news only, for there was fear that the enemy might be able to pick up the broadcasts of the news service and thus be able to anticipate us. As usual, there were many scoffers, but the consensus of opinion was in favor of the project. At any rate, what better expedient was there to offer?

The huge airport, now unused on account of the complete cessation of air traffic, was closed to the public. But there was quite a crowd to witness the take-off, the visitors from Washington, the officials of the field, and the two hundred workers who had enabled us to make ready for the adventure in time.

There were four to enter the *Pioneer*: Hart, George, Professor Lindquist, and myself. And when the entrance manhole was bolted home behind us, the watchers stood in silence, waiting for the roar of the *Pioneer's* motor. As the starter took hold, Hart waved his hand at one of the ports and every man of those two hundred and some watchers stood at attention and saluted as if he were a born soldier and Hart a born commander-in-chief.

We taxied heavily across the field, for the *Pioneer* was much overloaded for a quick take-off. She bumped and bounced for a quarter-mile before taking to the air and then climbed very slowly indeed, for several minutes. Our speed was a scant two hundred miles an hour when we swung out over New York and headed for the Atlantic. And then Hart made first use of the rocket tubes, not daring to discharge the hot gases below while over populated land at so low an altitude. He touched one button, maintaining the pressure for but a fraction of a second. The ocean slipped more rapidly away from beneath our feet and he touched the button once more. Our speed was now nearly

seven hundred miles an hour and we made haste to buckle ourselves into the padded, hammocklike contrivances which had been substituted for the former seats. In a very few minutes we entered level six and the motor was cut off entirely.

A blast from a number of the tail rockets drove me into my supporting hammock so heavily that I found difficulty in breathing, and could scarcely move a muscle to change position. The rate of acceleration was terrific, and I am still unable to understand how Hart was able to manipulate the controls. For myself, I could not even turn my head from its position in the padding and I felt as if I were being crushed by thousands of tons of pressure. Then, the pressure was somewhat relieved and I glanced to the instruments. We were more than a thousand miles from our starting point and the speed indicator read seven thousand miles an hour. We were traveling at the rate of nearly two miles a second!

Another blast from the rockets, this one of interminable length, and I must have lost consciousness. For when I next took note of things I

found that we had been out for nearly two hours and that the tremendous pressure of acceleration was relieved. I moved my head, experimentally and found that my senses were normal, though there was a strange and alarming sensation of being wrong side up. Then I remembered that I had experienced the same thing when we first searched the upper levels of the atmosphere for the origin of the destructive rays of the enemy.

But this was different! I gazed through a nearby port and saw that the sky was entirely black, the stars shining magnificently brilliant against their velvet background. Streamers of brilliant sunlight from the floor ports struck across the cabin and patterned the ceiling. Looking between my feet I saw the sun as a flaming orb with streamers of incandescence that spread in every direction with such blinding luminosity that I could not bear the sight for more than a few seconds. Off to what I was pleased to think of as our left side, there was a huge globe that I quickly made out as our own earth. Eerily green it shone, and, though a considerable portion of the

surface was obscured by patches of white that I recognized as clouds, I could clearly make out the continents of the eastern hemisphere. It was a marvelous sight and I lost several minutes in awed contemplation of the wonder. Then I heard Hart laugh.

"Just coming out of it, Jack?" he asked.

I stared at him foolishly. It had seemed to me that I was alone in this vast universe, and the sound of his voice startled me. "Guess I'm not fully out of it yet," I said. "Where are we?"

"Oh, about sixty thousand miles out," he replied carelessly; "and we are traveling at our maximum speed—that is, the maximum we need for this little voyage."

"Little voyage!" I gasped. And then I looked at George and the professor and saw that they, too, were grinning at my discomfiture. I laughed crazily, I suppose, for they all sobered at once.

Traveling through space at more than forty thousand miles an hour, it seemed that we were stationary. Movement was now easy—too easy, in fact, for we were practically weightless. The professor was having a time of it manipulating a pencil and a pad of paper on which he had a mass of small figures that were absolutely meaningless to me. He was calculating and plotting our course and, without him, we should never have reached the object we sought.

Time passed rapidly, for the wonders of the naked universe were a never-ending source of fascination. Occasionally a series of rocket charges was fired to keep our direction and velocity, but these were light, and the acceleration so insignificant that we were put to no discomfort whatever. But it was necessary that we keep our straps buckled, for, in the weightless condition, even the slightest increase or decrease in speed or change in direction was sufficient to throw us the length of the cabin, from which painful bruises might be received.

The supports to which we were strapped and which saved us from being crushed by the acceleration and

deceleration, were similar to hammocks, being hooked to the floor and ceiling of the cabin rather than suspended horizontally in the conventional manner. This was for the reason that the energy of the rockets was expended fore and aft, except for steering, and the forces were therefore along the horizontal axis of the vessel. The supports were elastic and the padding deep and soft. Being swiveled at top and bottom, they could swing around so that deceleration as well as acceleration was relieved. For this reason the controls had been altered so that the flexible support in which Hart was suspended could rotate about their pedestal, thus allowing for their operation by the pilot either when accelerating or decelerating. How he could control the muscles of his arms and hands under the extreme conditions is still a mystery to me, however, and George agrees with me in this. We found ourselves to be utterly helpless.

My next impression of the trip is that of swinging rapidly around and finding myself facing the rear wall of the cabin. Then the tremendous pressure once more at a burst from the forward tubes. We had

commenced deceleration. For me there were alternate periods of full and semi-consciousness and, to this day, I can remember no more than the high spots of that historical expedition.

Then we were free to move once more, and I turned to face the instrument board. Our relative velocity had become practically zero; that is, we were traveling through space at about the same speed and in the same direction as the earth. The professor and Hart were consulting a pencil chart and excitedly looking first through the forward ports and then into the screen of the periscope.

"This is the approximate location," averred the professor.

"But they are not here," replied Hart.

George and I peered in all directions and could see nothing excepting the marvels of the universe we had been viewing. The moon now seemed very close and its craters and so-called seas were as plainly visible as in a four-inch telescope on earth. But we saw

nothing of the enemy.

The earth was a huge ball still, but much smaller than when I had first observed it from the heavens. The sun's corona—the flaming streamers which the professor declared extended as much as five million miles into space—was partly hidden behind the rim of the earth and the effect was blinding. A thin crescent of brilliant light marked the rim of our planet and the rest was in shadow, but a shadow that was lighted awesomely in cold green by reflected light from her satellite.

"I have it!" suddenly shouted the professor. "We are all in very nearly the same line with reference to the sun, and the enemy is between the blazing body and ourselves. We must shift our position, move into the shadow of the earth. We have missed our calculation by a few hundred miles, that is all."

All! I thought. These astronomers, so accustomed to dealing in tremendous distances that must be measured in light-years, thought nothing of an error of several hundred miles. But I suppose it was really

an inconsiderable amount, at that.

At any rate, we shifted position and looked around a bit more. We saw nothing at first. Then Hart consulted the chronometer.

"Time is up!" he shouted.

On the instant there was a flash of dazzling green light from a point not a hundred miles from our position, a flash that was followed by a streaking pencil of the same light shooting earthward with terrific velocity. Breathlessly we followed its length, saw it burst like a bomb and hurl three green balls from itself which sped at equally spaced angles to form a perfect triangle. They hovered a moment at about two thousand miles above the surface of the earth, according to the professor, who was using the telescope at the time, and shot their deadly rays toward our world. We were too late to prevent the renewal of hostilities!

Another and another streak of green light followed and we knew that great havoc was being wrought

back home. But these served to locate the enemy's position definitely and we immediately set about to draw nearer. We were still somewhat on the dark side of the object, which had prevented our seeing it. Now we swung about so that it was plainly visible. And, what a strange appearance it presented, out here in space!

Fully fifteen miles in diameter, it was a huge doughnut, a great ring of tubing with a center-opening that was at least eighty per cent of its maximum diameter. There it hovered, sending out those deadly missiles in a continuous stream toward our poor world. As we approached the weird space flier, we saw that a number of objects floated about within the great circle of its inner circumference. The NY-18, the SF-61 and the SF-22, without doubt! The theory of Hart's was correct in every detail.

We were still at about ten miles distance from the great ring and the streaking light pencils were speeding earthward at the rate of one a minute now. There was no time to lose. Already there was more destruction on its way than had been previously

wrought—several times over.

Hart was sighting along a tiny tube that projected into the forward partition and he maneuvered the *Pioneer* until she was nose on to the great ring. He pulled a switch and there came a purring that was entirely new. A row of huge vacuum tubes along the wall lighted to vivid brilliancy and a throbbing vibration filled the artificial air of the cabin.

He pulled a small lever at the side of the tube and the vessel rocked to the energy that was released from those vacuum tubes. The thin rod which had been installed at the *Pioneer's* nose burst into brilliant flame—orange tinted luminescence that grew to a sphere of probably ten feet in diameter. Then there was a heavy shock and the ball of fire left its position and, with inconceivable velocity, sprang straight for the side of the great ring. It was a fair hit and, when the weird missile found its mark, it simply vanished—swallowed up in the metal walls of the monster vessel. For a moment we thought nothing was to result. Then we burst into shouts of joy, for a great section of the ring fused into nothingness and was

gone! Fully a quarter of the circumference of the ring had disappeared into the vacuum of space. Truly, the governments of Earth had developed some terrible weapons of their own!

We watched, breathless.

The green light pencils no longer streaked their paths of death in the direction of our world, which now seemed so remote. The great ring with the vacant space in its rim wobbled uncertainly for a moment as though some terrific upheaval from within was tearing it asunder. Then it lurched directly for the *Pioneer*. We had been observed!

But Hart was equal to the occasion and he shot the *Pioneer* in the direction of the earth with such acceleration that we all were flattened into our supports with the same old violence. Then, with equal violence, we decelerated. The ring was following so closely that it actually rushed many hundreds of miles past us before it was brought to rest. From it there sprang one of the light pencils, and the *Pioneer* was rocked as by a heavy gale when it rushed past on its

harmless way into infinity. The enemy had missed.

Meanwhile, Hart was operating another mechanism that was new to the *Pioneer* and again he sighted along the tiny tube. This time there was no sound within, no ball of fire without, no visible ray. But, when he had pressed the release of this second energy, the ring seemed to shrivel and twist as if gripped by a giant's hand. It reeled and spun. Then, no longer in a balance of forces, it commenced its long drop earthward.

His job finished and finished well, Hart Jones collapsed.

Following his more than three days and four nights of superhuman endeavor, it seemed strange to see Hart slumped white and still over the control pedestal. He who had energy far in excess of that of any of the rest of us had worn himself out. Having had no rest or sleep in nearly a hundred hours, the body that housed so wonderful a spirit simply refused to carry on. Tenderly we stretched him on the cabin floor, the *Pioneer* drifting in space the while. The professor,

who was likewise something of a physician, listened to his heart, drew back his eyelids, and pronounced him in no danger whatever.

We slapped his wrists, sprinkled his face and neck with cold water from the drinking supply, and were soon rewarded by his return to consciousness. He smiled weakly and fell sound asleep. No war in the universe could have wakened him then, so we lifted him to his feet—rather I should say, we guided his practically floating body—and strapped him in George's hammock, preparing for the homeward journey. Though dangling from the straps in a position that would be vertical were we on earth, he slept like a baby. George took the controls in Hart's place and the professor and I returned to our accustomed supports.

The return trip was considerably slower, as George did not wish to push the *Pioneer* to its limit as had been necessary when coming out to meet the enemy, nor was he able to keep control of the ship against a too-rapid acceleration. Consequently, the rate of acceleration was much lower and we were not nearly

as uncomfortable as on the outgoing trip. Thus, nearly ten hours were required for the return. And Hart slept through it all.

In order to make best use of the small amount of fuel still in the cylinders, George circled the earth five times before we entered the upper limits of the atmosphere, the circles becoming of smaller diameter at each revolution and the speed of the ship proportionately reduced. An occasional discharge from one of the forward rocket tubes assisted materially in the deceleration, yet, when we slipped into level five, our speed was so great that the temperature of the cabin rose alarmingly, due to the friction of the air against the hull of the vessel. It was necessary to use the last remaining ounce of fuel to reduce the velocity to a safe value. A long glide to earth was then our only means of landing and, since we were over the Gulf of Mexico at the time, we had no recourse other than landing in the State of Texas.

Passing over Galveston in level three, we found that the Humble oil fields and a great section of the surrounding country had been the center of one of the

enemy bombardments. All was blackness and ruin for many miles between this point and Houston. At Houston Airport we landed, unheralded but welcome.

The lower levels were once more filled with traffic, and one of the southern route transcontinental liners had just made its stop at this point. The arrival of the *Pioneer* was thus witnessed by an unusually large crowd, and, when the news was spread to the city, their numbers increased with all the rapidity made possible by the various means of transportation from the city.

So it was that Hart Jones, after we finally succeeded in awakening him and getting him to his feet, was hailed by a veritable multitude as the greatest hero of all time. The demonstrations become so enthusiastic that police reserves, hastily summoned from the city, were helpless in their attempts to keep the crowd in order.

It was with greatest difficulty that Hart was finally extricated from the clutches of the mob and conveyed to the new Rice Hotel in Houston, where it was

necessary to obtain medical attention for him immediately. He was in no condition at the time to receive the richly deserved plaudits of the multitude, and, truth to tell, we others from the *Pioneer* were in much the same shape.

To me that night will always be the most terrible of nightmares. My first thought was of my family and, when I had been assigned to a room, I immediately asked the switchboard operator for a long-distance connection to my home in Rutherford. There was complete silence for a minute and I jangled the hook impatiently, my head throbbing with a thousand aches and pains. Then, to my surprise, the voice of the hotel manager greeted me.

"Mr. Makely," he said softly, and I thought there was a peculiar ring in his voice, "I think you had better not try to get Rutherford this evening. We are sending the house physician to your room at once and—there are orders from Washington, you know—you are to think of nothing at the present but sleep and a long rest."

"Why—why—" I stammered, "can't you see? I must

communicate with my family. They must know of my return. I must know if they're safe and well."

"I'm sorry, sir," apologized the manager, "Government orders, you know." And he hung up.

Something in that soft voice brought to me an inkling of the truth. An icy hand gripped my heart as I heard a knock at the door. With palsied fingers I turned the key and admitted the professor and a kindly-faced elderly gentleman with a small black bag. One look at the professor told me the truth. I seized his two arms in a grip that made him wince.

"Tell me! Tell me!" I demanded, "Has anything happened to my family?"

"Jack," said the professor slowly, "while we were out there watching Hart destroy the enemy vessel, Rutherford was destroyed!"

It must be that I frightened him by my answering stare, for he backed away from me in apparent fear. I noticed that the doctor was rummaging in his bag. I

know I did not speak, did not cry out, for my tongue clove to the roof of my mouth. It seemed I must go mad. The professor still backed away from me; then, wiry little athlete that he was, he sprang directly for my knees in a beautiful football tackle. I remember that point clearly and how I admired his agility at the time. I remember the glint of a small instrument in the doctor's hand. Then all was blackness.

Eight days later, they tell me it was, I returned to painful consciousness in a hospital bed. But let me skip the agony of mind I experienced then. Suffice it to say that, when I was able, I set forth for Washington. Hart Jones was there and he had sent for me. But I took little interest in the going; did not even bother to speculate as to the reason for his summons. I had devoured the news during my convalescence and now, more than two weeks after the destruction of the Terror, I knew the extent of the damage wrought upon our earth by those deadly green light pencils we had seen issuing from the huge ring up there in the skies. The horror of it all was fresh in my mind, but my own private horror overshadowed all.

I was glad that Hart had been so signally honored by the World Peace Board, that he was now the most famous and popular man in the entire world. He deserved it all and more. But what cared I—I who had done least of all to help in his great work—that the Terror had been found where it buried itself in the sand of the Sahara when falling to earth? What cared I that the discoveries made in the excavating of the huge metal ring were of inestimable value to science?

It gave me passing satisfaction to note that all of Hart Jones' theories were borne out by the discoveries; that Oradel and his minions were responsible for this terrible war; that the planet they aligned against us was Venus and that more than a hundred thousand of the Venerians had been carried in that weird engine of destruction which had been brought down by Hart.

It was interesting to read of the fall of that huge ring; how it was heated to incandescence when it entered our atmosphere at such tremendous velocity; of the tidal waves of concentric billows in the sand that led to its discovery by Egyptian Government planes. The broadcast descriptions and the television views of the

stunted and twisted Venerians whose bodies were recovered from the partly consumed wreckage were interesting. But it all left me cold. I had no further interest in life. That the world had escaped an overwhelming disaster was clear, and it gave me a certain pleasure. But for me it might as well have been completely destroyed.

Nevertheless, I went to Washington. I felt somehow that I owed it to Hart Jones, the greatest world hero since Lindbergh. I would at least listen to what he had to say.

A fast plane carried me, a plane chartered by the government. To me it seemed that it crawled, though it was a sixth-level ship, and made the trip in record time. Why I was impatient to reach Washington I do not know, for I was absolutely disinterested in anything that might occur there. It was merely that my nerves were on edge, I suppose, and everything annoyed me.

Hart met me at the airport and greeted me like a long-lost brother. He talked incessantly and jumped

from one subject to the other with the obvious intention of trying to get my mind off my troubles until we reached his office in the Air Traffic building.

On his door there was the legend, "Director of Research," and, when we had entered, I observed that the office was furnished with all the luxury that suited his new position. I dropped into a deeply upholstered chair at the side of his mahogany desk, and, for the space of several minutes, Hart regarded me with concern, speaking not a word.

"Jack, old man," he finally ventured. "I can't talk to you of this thing. But it makes me feel very badly to see you take it so hard. There are many things you have to live for, old top, and it is to talk about these that I sent for you."

"You mean work?" I asked.

"Yes. That is the best thing for us all, in any emergency or under any circumstances whatever. Preston wants you back for one thing, and he authorized me to tell you that the job of office

manager is waiting for you at double your former salary."

My eyes misted at this. Preston was a good old scout! But I could never bear it to return to the old surroundings, even in the city. "No, Hart," I said, "I'd rather be away from New York and from that part of the country. Associations, you know."

"I understand," he replied, "and that is just what I had hoped you would decide. Because I have a job for you in the Air Service. A good one, too."

"You know there is much reconstruction work to be done on earth. More than forty cities and towns have been wiped out of existence and these must be rebuilt. That will occupy the minds and energies of thousands who have been bereaved as you have. But, in the Air Service, we have a program that I believe will be more to your liking. The log of the *Terror*, in Oradel's handwriting, was found intact, as were a number of manuscripts pertaining to plans of the Venerians."

"These misshapen creatures were quite evidently educated by Oradel to a hatred of our world. We have reason to believe that other attacks may follow, for they were obviously intending to migrate here in millions. And, according to records found aboard the *Terror*, they are of advanced scientific accomplishment. We may expect them to construct other vessels similar to the *Terror* and to come here again. We must be prepared to fight them off, to carry the war to their own planet if necessary. My work is to organize a world fleet of space ships for this purpose, and I'd like you to help me in this. The work will take you all over the world and will keep you too busy to think about—things."

It was just like Hart, and I thanked him wordlessly, but from the bottom of my heart. Yes, I would accept his generous offer. Though I was no engineer, I had a knowledge of scientific subjects a little above the average, and I could follow instructions. By George, it was the very thing! Suddenly I grew enthusiastic.

There was the sound of voices in the outer office, and Hart's secretary entered to announce the arrival of

George Boehm and Professor Lindquist. This was great!

Chubby George, red-faced and smiling as ever, embraced me with one short arm and pounded me on the back with his other fist in his jovial, joking manner. It was good to have friends like these! The professor held forth his hand timidly. He was thinking of that tackle and the half-Nelson he had used on me while the doctor slipped that needle into my arm back there in Houston.

"Don't remove your glasses, Professor," I laughed; "I'm not going to hit you. That was a swell tackle of yours, and you did me a big service down there in the Rice Hotel."

He beamed with pleasure and gripped my hand—mightily, for such a little fellow. George was whispering to Hart, and I could see that they were greatly excited over something.

"Jack," said Hart, when the professor and I finished talking things over, "George here wants you to take a

little trip over to Philly with him. He has something there he wants to show you."

I looked from one to the other for signs of a hoax. These two, under normal circumstances, were always up to something. But what I saw in their expressions convinced me that I had better go, and somehow, there rose in my breast a forlorn hope.

"All right," I agreed. "Let's go!"

Once more we four took off together, this time in a speedy little first-level cabin plane of Hart's design, piloted by the irrepressible George. I was brimming with questions, but George kept up such a running fire of small talk that I was unable to get in a single word throughout the short trip to the Quaker City. It was quite evident that something was in the wind.

Instead of landing at the airport, George swung across the city and dropped to the roof landing space of a large building which I recognized as the Germantown Hospital. We had no sooner landed when I was rushed from the plane to the penthouse over the

elevator shafts. We were soon on the main floor and George went immediately to the desk at the receiving office, where he engaged in earnest conversation with the nurse in charge.

"What are you doing—committing me?" I asked, half joking only. For, from the mysterious expression of my friends' faces, I was not sure what to expect.

"No," laughed Hart. "George learned of the existence of a patient here who may turn out to be a very good friend of yours."

I turned this over in my mind, which did not yet function quite normally. A friend? Why, I had very few that could really be termed good friends outside of those that accompanied me. It could mean but one thing. Possibly one of my children—or even my dear wife—might have escaped somehow. I followed in a daze as a white-capped and gowned nurse led us along the corridor and into a ward where there were dozens of high, white beds.

Some of the patients were swathed in bandages; some

sat up in their beds, reading or just staring; others lay inert and pale. The reek of iodoform pervaded the large room.

We stopped at the bedside of one of the staring patients, a young woman who looked unseeingly at our party. Great heavens, it was Marie!

A physician stood at the other side of her bed, finger on her pulse. The others drew back as I approached her side, raised her free hand to my lips and spoke to her.

"Marie, dear," I asked gently, forcing the lump from my throat as best I could, "don't you know me? It's Jack, Honey."

The fixed stare of the great blue eyes shifted in my direction. It seemed that they looked through and past me into some terrible realm where only horror held sway. She drew her hand from my grasp and passed it before those staring, unnatural eyes. There was an audible gulp from George. But the doctor smiled encouragement to me. I tried once more.

"Marie," I said, "where are Jim and Jackie?"

The hand fluttered to her lap, where it lay, blue-veined and pitifully thin. The stare focussed on me, seemed to concentrate. Then the film was gone from the eyes and she saw—she knew me!

"Oh, Jack!" she wailed, "I have been away. Don't you know where they are?"

My heart nearly stopped at this, but I sat on the edge of the bed and took her in my arms, looking at the doctor for approval. He nodded his head brightly and beckoned to the nurse.

"Bring the children," I heard him whisper.

My cup was full. But I must be calm for Marie's sake. She had closed her eyes now and great tears coursed down her waxen cheeks. Her body shook with sobs.

"She'll recover?" I asked the doctor.

"You bet. Just an aggravated case of amnesia. Hasn't

eaten. Didn't even know her children. Cured now, but she'll need a few weeks to build up." He snapped shut the lid of his watch.

Those succinct sentences were the finest I had ever heard.

Marie clung to me like an infant to its mother. Her sobs gradually ceased and she looked into my eyes. Little Jim and Jack had come in and were clamoring for recognition.

"Oh, Jack," Marie whispered, "I'm so happy."

She relinquished me and turned her attention to the children. I saw that my friends had left and that an orderly was placing screens about us. So I'll close the screen on the remainder of this most happy reunion.

It was several days before I had the complete story. Being lonesome during my absence when we were preparing for the voyage into space, and not knowing just when I would return, Marie had packed a grip and taken the train for Philadelphia, deciding to

spend a few days with her Aunt Margaret, or at least to remain there with the children until I returned.

She had boarded the train at Manhattan Transfer at about the time we reached the location of the *Terror* and the train was just pulling out of the station when there came the first of the new attacks of the enemy. She thought that the pillar of fire rose from the approximate location of Rutherford, but was not sure until they reached Newark, when the news was spread throughout the train by passengers who boarded it there. She worried and cried over the loss of our little home and had worked herself into a state of extreme nervousness and near-hysteria by the time they reached New Brunswick.

Then, as the long train left New Brunswick, there was another attack, this one on the town they had just left. The last two cars of the train were blown from the track by the initial concussion, and the remainder of the train brought to a grinding, jerking stop that threw the passengers into a panic.

Already hysterical, Marie was in no condition to bear

up under the shock, and the loss of memory followed. Jack and Jim clung to her, of course, and were taken to the Germantown Hospital with her when the wreck victims were transferred to that point. She had no identification on her person, and it was by sheerest luck that George, who was visiting a friend in the same hospital, chanced to see her and thought he recognized her.

That was all of it, but to me it was more than enough. From the depths of despondency, I rose to the peaks of elation. It was true that we would have to establish a new home, but this would be a joy as never before. Those I had given up as lost were restored to me and I was content. Hart would have to make some changes in the duties of that new job—the world travel was out of the picture. I had had my fill of adventure.

Besides, the hot spell was over.

#39 The Forgotten Planet, By Sewell Peaslee Wright:

The authentic account of why cosmic man damned an outlaw world to be, forever, a leper of space.

Aproximate word count:

Bigotry:

Warnings:

I have been asked to record, plainly and without prejudice, a brief history of the Forgotten Planet.

That this record, when completed, will be sealed in the archives of the Interplanetary Alliance and remain there, a secret and rather dreadful bit of history, is no concern of mine. I am an old man, well past the century mark, and what disposal is made of my work is of little importance to me. I grow weary of life and living, which is good. The fear of death was lost when

our scientists showed us how to live until we grew weary of life. But I am digressing—an old man's failing.

“It's nothing. Close the exit; we depart at once.”

The Forgotten Planet was not always so named. The name that it once bore had been, as every child knows, stricken from the records, actual and mental, of the Universe. It is well that evil should not be remembered. But in order that this history may be clear in the centuries to come, my record should go back to beginnings.

So far as the Universe is concerned, the history of the Forgotten Planet begins with the visit of the first craft ever to span the space between the worlds: the crude, adventuresome *Edorn*, whose name, as well as the names of the nine Zenians who manned her, occupy the highest places in the roll of honor of the Universe.

Ame Baove, the commander and historian of the *Edorn*, made but brief comment on his stop at the Forgotten Planet. I shall record it in full:

"We came to rest upon the surface of this, the fourth of the planets visited during the first trip of the *Edorn*, eighteen spaces before the height of the sun. We found ourselves surrounded immediately by vast numbers of creatures very different from ourselves, and from their expressions and gestures, we gathered that they were both curious and unfriendly.

"Careful analysis of the atmosphere proved it to be sufficiently similar to our own to make it possible for us to again stretch our legs outside the rather cramped quarters of the *Edorn*, and tread the soil of still another world.

"No sooner had we emerged, however, than we were angrily beset by the people of this unfriendly planet, and rather than do them injury, we retired immediately, and concluded our brief observations through our ports.

"The topography of this planet is similar to our own, save that there are no mountains, and the flora is highly colored almost without exception, and apparently quite largely parasitical in nature. The

people are rather short in stature, with hairless heads and high foreheads. Instead of being round or oval, however, the heads of these people rise to a rounded ridge which runs back from a point between and just above the eyes, nearly to the nape of the neck behind. They give evidence of a fair order of intelligence, but are suspicious and unfriendly. From the number and size of the cities we saw, this planet is evidently thickly populated.

"We left about sixteen spaces before the height of the sun, and continued towards the fifth and last planet before our return to Zenia."

This report, quite naturally, caused other explorers in space to hesitate. There were so many friendly, eager worlds to visit, during the years that relations between the planets were being established, that an unfriendly people were ignored.

However, from time to time, as space-ships became perfected and more common, parties from many of the more progressive planets did call. Each of them met with the same hostile reception, and at last,

shortly after the second War of the Planets, the victorious Alliance sent a fleet of the small but terrible Deuber Spheres, convoyed by four of the largest of the disintegrator ray-ships, to subjugate the Forgotten Planet.

Five great cities were destroyed, and the Control City, the seat of the government, was menaced before the surly inhabitants conceded allegiance to the Alliance. Parties of scientists, fabricators, and workmen were then landed, and a dictator was appointed.

From all the worlds of the Alliance, instruments and equipment were brought to the Forgotten Planet. A great educational system was planned and executed, the benign and kindly influence of the Alliance made every effort to improve the conditions existing on the Forgotten Planet, and to win the friendship and allegiance of these people.

For two centuries the work went on. Two centuries of bloodshed, strife, hate and disturbance. No where else within the known Universe was there ill feeling. The second awful War of the Planets had at last

succeeded in teaching the lesson of peace.

Two centuries of effort—wasted effort. It was near the end of the second century that my own story begins.

Commander at that time of the super-cruiser *Tamon*, a Special Patrol ship of the Alliance, I was not at all surprised to receive orders from the Central Council to report at emergency speed. Special Patrol work in those days, before the advent of the present decentralized system, was a succession of false starts, hurried recalls, and urgent, emergency orders.

I obeyed at once. In the Special Patrol service, there is no questioning orders. The planet Earth, from which I sprang, is and always has been proud of the fact that from the very beginning, her men have been picked to command the ships of the Special Patrol. No matter how dangerous, how forlorn and hopeless the mission given to a commander of a Special Patrol ship, history has never recorded that any commander has ever hesitated. That is why our uniform of blue and silver commands the respect that it does even in this day and age of softening and decadence, when

men—but again an old man digresses. And perhaps it is not for me to judge.

I pointed the blunt nose of the *Tamon* at Zenia, seat of the Central Council, and in four hours, Earth time, the great craft swept over the gleaming city of the Central Council and settled swiftly to the court before the mighty, columned Hall of the Planets.

Four pages of the Council, in their white and scarlet livery, met me and conducted me instantly to a little anteroom behind the great council chamber.

There were three men awaiting me there; three men whose faces, at that time, were familiar to every person in the known Universe.

Kellen, the oldest of the three, and the spokesman, rose as I entered the room. The others did likewise, as the pages closed the heavy doors behind me.

"You are prompt, and that is good," thought Kellen. "I welcome you. Remove now thy menore."

I glanced up at him swiftly. This must surely be an important matter, that I was asked to remove my menore band.

It will, of course, be understood that at that time we had but a bulky and clumsy instrument to enable us to convey and receive thought; a device consisting of a heavy band of metal, in which were imbedded the necessary instruments and a tiny atomic energy generator, the whole being worn as a circlet or crown upon the head.

Wonderingly, I removed my menore, placed it upon the long, dark table around which the three men were standing, and bowed. Each of the three, in turn, lifted their gleaming circlets from their heads, and placed them likewise upon the table before them.

"You wonder," said Kellen, speaking of course, in the soft and liquid universal language, which is, I understand, still disseminated in our schools, as it should be. "I shall explain as quickly and as briefly as

possible.

"We have called you here on a dangerous mission. A mission that will require tact and quickness of mind as well as bravery. We have selected you, have called you, because we are agreed that you possess the qualities required. Is it not so?" He glanced at his two companions, and they nodded gravely, solemnly, without speaking.

"You are a young man, John Hanson," continued Kellen, "but your record in your service is one of which you can be proud. We trust you—with knowledge that is so secret, so precious, that we must revert to speech in order to convey it; we dare not trust it, even in this protected and guarded place, to the minore's quicker but less discreet communication."

He paused for a moment, frowning thoughtfully as though dreading to begin. I waited silently, and at last he spoke again.

"There is a world"—and he named a name which I

shall not repeat, the name of the Forgotten Planet —"that is a festering sore upon the body of the Universe. As you know, for two centuries we have tried to pass on to these people an understanding of peace and friendship. I believe that nothing has been left undone. The Council and the forces behind it have done everything within their power. And now—"

He stopped again, and there was an expression of deepest pain written upon his wise and kindly face. The pause was for but an instant.

"And now," he went on firmly, "it is at an end. Our work has been undone. Two centuries of effort—undone. They have risen in revolt, they have killed all those sent by the Alliance of which this Council is the governing body and the mouthpiece, and they have sent us an ultimatum—a threat of war!"

"*What?*"

Kellen nodded his magnificent old head gravely.

"I do not wonder that you start," he said heavily.
"War! It must not be. It cannot be! And yet, war is what they threaten."

"But, sir!" I put in eagerly. I was young and rash in those days. "Who are they, to make war against a united Universe?"

"I have visited your planet, Earth," said Kellen, smiling very faintly. "You have a tiny winged insect you call *bee*. Is it not so?"

"Yes."

"The bee is a tiny thing, of little strength. A man, a little child, might crush one to death between a thumb and finger. But the bee may sting before he is crushed, and the sting may linger on for days, a painful and unpleasant thing. Is that not so?"

"I see, sir," I replied, somewhat abashed before the tolerant, kindly wisdom of this great man. "They cannot hope to wage successful war, but they may bring much suffering to others."

"Much suffering," nodded Kellen, still gently smiling. "And we are determined that this thing shall not be. Not"—and his face grew gray with a terrible and bitter resolve—"not if we have to bring to bear upon that dark and unwilling world the disintegrating rays of every ship of the Alliance, so that the very shell of the planet shall disappear, and no life ever again shall move upon its surface.

"But this," and he seemed to shudder at the thought, "is a terrible and a ruthless thing to even contemplate. We must first try once again to point out to them the folly of their ways. It is with this mission that we would burden you, John Hanson."

"It is no burden, but an honor, sir," I said quietly.

"Youth! Youth!" Kellen chided me gently. "Foolish, yet rather glorious. Let me tell you the rest, and then we shall ask for your reply again.

"The news came to us by a small scout ship attached

to that unhappy world. It barely made the journey to Jaron, the nearest planet, and crashed so badly, from lack of power, that all save one man were killed.

"He, luckily, tore off his menore, and insisted in speech that he be brought here. He was obeyed, and, in a dying condition, was brought to this very chamber." Kellen glanced swiftly, sadly, around the room, as though he could still visualize that scene.

"Every agent of the Alliance upon that hateful planet was set upon and killed, following the working out of some gigantic and perfectly executed plan—all save the crew of this one tiny scout ship, which was spared to act as a messenger.

"'Tell your great Council,' was the message these people sent to us, 'that here is rebellion. We do not want, nor will we tolerate, your peace. We have learned now that upon other worlds than ours there are great riches. These we shall take. If there is resistance, we have a new and a terrible death to deal. A death that your great scientists will be helpless against; a horrible and irresistible death that

will make desolate and devoid of intelligent life any world where we are forced to sow the seeds of ultimate disaster.

"We are not yet ready. If we were, we would not move, for we prefer that your Council have time to think about what is surely to come. If you doubt that we have the power to do what we have threatened to do, send one ship, commanded by a man whose word you will trust, and we will prove to him that these are no empty words."

"That, as nearly as I can remember it," concluded Kellen, "is the message. The man who brought it died almost before he had finished.

"That is the message. You are the man we have picked to accept their challenge. Remember, though, that there are but the four of us in this room. There are but four of us who know these things. If you for any reason do not wish to accept this mission, there will be none to judge you, least of all, any one of us, who

know best of all the perils."

"You say, sir," I said quietly, although my heart was pounding in my throat, and roaring in my ears, "that there would be none to judge me.

"Sir, there would be myself. There could be no more merciless judge. I am honored that I have been selected for this task, and I accept the responsibility willingly, gladly. When is it your wish that we should start?"

The three presiding members of the Council glanced at each other, faintly smiling, as though they would say, as Kellen had said a short time before: "Youth! Youth!" Yet I believe they were glad and somewhat proud that I had replied as I did.

"You may start," said Kellen, "as soon as you can complete the necessary preparations. Detailed instructions will be given you later."

He bowed to me, and the others did likewise. Then Kellen picked up his menore and adjusted it.

The interview was over.

"What do you make it?" I asked the observer. He glanced up from his instrument.

"Jaron, sir. Three degrees to port; elevation between five and six degrees. Approximate only, of course, sir."

"Good enough. Please ask Mr. Barry to hold to his present course. We shall not stop at Jaron."

The observer glanced at me curiously, but he was too well disciplined to hesitate or ask questions.

"Yes, sir!" he said crisply, and spoke into the microphone beside him.

None of us wore menores when on duty, for several reasons. Our instruments were not nearly as perfect as those in use to-day, and verbal orders were clearer and carried more authority than mental instructions. The delicate and powerful electrical and atomic mechanism of our ship interfered with the functioning of the menores, and at that time the old habit of

speech was far more firmly entrenched, due to hereditary influence, than it is now.

I nodded to the man, and made my way to my own quarters. I wished most heartily that I could talk over my plans with someone, but this had been expressly forbidden.

"I realize that you trust your men, and more particularly your officers," Kellen had told me during the course of his parting conversation with me. "I trust them also—yet we must remember that the peace of mind of the Universe is concerned. If news, even a rumor, of this threatened disaster should become known, it is impossible to predict the disturbance it might create.

"Say nothing to anyone. It is your problem. You alone should leave the ship when you land; you alone shall hear or see the evidence they have to present, and you alone shall bring word of it to us. That is the wish of the Council."

"Then it is my wish," I had said, and so it had been

settled.

Aft, in the crew's quarters, a gong sounded sharply: the signal for changing watches, and the beginning of a sleep period. I glanced at the remote control dials that glowed behind their glass panel on one side of my room. From the registered attraction of Jaron, at our present speed, we should be passing her within, according to Earth time, about two hours. That meant that their outer patrols might be seeking our business, and I touched Barry's attention button, and spoke into the microphone beside my bunk.

"Mr. Barry? I am turning in for a little sleep. Before you turn over the watch to Eitel, will you see that the nose rays are set for the Special Patrol code signal for this enar. We shall be close to Jaron shortly."

"Yes, sir! Any other orders?"

"No. Keep her on her present course. I shall take the watch from Mr. Eitel."

Since there have been changes since those days, and

will undoubtedly be others in the future, it might be well to make clear, in a document such is this, that at this period, all ships of the Special Patrol Service identified themselves by means of invisible rays flashed in certain sequences, from the two nose, or forward, projectors. These code signals were changed every enar, a period of time arbitrarily set by the Council; about eighteen days, as time is measured on the Earth, and divided into ten periods, as at present, known as enarens. These were further divided into enaros, thus giving us a time-reckoning system for use in space, corresponding roughly to the months, days and hours of the Earth.

I retired, but not to sleep. Sleep would not come. I knew, of course, that if curious outer patrol ships from Jaron did investigate us, they would be able to detect our invisible ray code signal, and thus satisfy themselves that we were on the Council's business. There would be no difficulty on that score. But what I should do after landing upon the rebellious sphere, I had not the slightest idea.

"

Be stern, indifferent to their threats," Kellen, had counseled me, "but do everything within your power to make them see the folly of their attitude. Do not threaten them, for they are a surly people and you might precipitate matters. Swallow your pride if you must; remember that yours is a gigantic responsibility, and upon the information you bring us may depend the salvation of millions. I am convinced that they are not—you have a word in your language that fits exactly. Not pretending ... what is the word?"

"Bluffing?" I had supplied in English, smiling.

"Right! Bluffing. It is a very descriptive word. I am sure they are not bluffing."

I was sure of it also. They knew the power of the Alliance; they had been made to feel it more than once. A bluff would have been a foolish thing, and these people were not fools. In some lines of research they were extraordinarily brilliant.

But what could their new, terrible weapon be? Rays we had; at least half a dozen rays of destruction; the terrible dehydrating ray of the Deuber Spheres, the disintegrating ray that dated back before Ame Baove and his first voyage into space, the concentrated ultra-violet ray that struck men down in fiery torment.... No, it could hardly be a new ray that was their boasted weapon.

What, then? Electricity had even then been exhausted of its possibilities. Atomic energy had been released, harnessed, and directed. Yet it would take fabulous time and expense to make these machines of destruction do what they claimed they would do.

Still pondering the problem, I did fall at last into a fitful travesty of sleep.

I was glad when the soft clamor of the bell aft announced the next change of watch. I rose, cleared the cobwebs from my brain with an icy shower, and made my way directly to the navigating room.

"Everything tidy, sir," said Eitel, my second officer,

and a Zenian. He was thin and very dark, like all Zenians, and had the high, effeminate voice of that people. But he was cool and fearless and had the uncanny cerebration of his kind; I trusted him as completely as I trusted Barry, my first officer, who, like myself, was a native of Earth. "Will you take over?"

"Yes," I nodded, glancing at the twin charts beneath the ground glass top of the control table. "Get what sleep you can the next few enaros. Presently I shall want every man on duty and at his station."

He glanced at me curiously, as the observer had done, but saluted and left with only a brief, "Yes, sir!" I returned the salute and turned my attention again to the charts.

The navigating room of an interplanetary ship is without doubt unfamiliar ground to most, so it might be well for me to say that such ships have, for the most part, twin charts, showing progress in two dimensions; to use land terms, lateral and vertical. These charts are really no more than large sheets of

ground glass, ruled in both directions with fine black lines, representing all relatively close heavenly bodies by green lights of varying sizes. The ship itself is represented by a red spark and the whole is, of course, entirely automatic in action, the instruments comprising the chart being operated by super-radio reflexes.

Jaron, the charts showed me at a glance, was now far behind. Almost directly above—it is necessary to resort to these unscientific terms to make my meaning clear—was the tiny world Elon, home of the friendly but impossibly dull winged people, the only ones in the known Universe. I was there but once, and found them almost laughably like our common dragon-flies on Earth; dragon-flies that grow some seven feet long, and with gauzy wings of amazing strength.

Directly ahead, on both charts, was a brilliantly glowing sphere of green—our destination. I made some rapid mental calculations, studying the few fine black lines between the red spark that was our ship, and the nearest edge of the great green sphere. I

glanced at our speed indicator and the attraction meter. The little red slide that moved around the rim of the attraction meter was squarely at the top, showing that the attraction was from straight ahead; the great black hand was nearly a third of the way around the face.

We were very close; two hours would bring us into the atmospheric envelope. In less than two hours and a half, we would be in the Control City of what is now called the Forgotten Planet!

I glanced forward, through the thick glass partitions, into the operating room. Three men stood there, watching intently; they too, were wondering why we visited the unfriendly world.

The planet itself loomed up straight ahead, a great half-circle, its curved rim sharp and bright against the empty blackness of space; the chord ragged and blurred. In two hours ... I turned away and began a restless pacing.

An hour went by; an hour and a half. I pressed the

attention button to the operating room, and gave orders to reduce our speed by half. We were very close to the outer fringe of the atmospheric envelope. Then, keeping my eye on the big surface-temperature gauge, with its stubby red hand, I resumed my nervous pacing.

Slowly the thick red hand of the surface-temperature gauge began to move; slowly, and then more rapidly, until the eyes could catch its creeping.

"Reduce to atmospheric speed," I ordered curtly, and glanced down through a side port at one end of the long navigating room.

We were, at the moment, directly above the twilight belt. To my right, as I looked down, I could see a portion of the glistening antarctic ice cap. Here and there were the great flat lakes, almost seas, of the planet.

Our geographies of the Universe to-day do not show the topography of the Forgotten Planet: I might say, therefore, that the entire sphere was land area, with

numerous great lakes embedded in its surface, together with many broad, very crooked rivers. As Ame Baove had reported, there were no mountains, and no high land.

"Altitude constant," I ordered. "Port three degrees. Stand by for further orders."

The earth seemed to whirl slowly beneath us. Great cities drifted astern, and I compared the scene below me with the great maps I took from our chart-case. The Control City should be just beyond the visible rim; well in the daylight area.

"Port five degrees," I said, and pressed the attention button to Barry's quarters.

"Mr. Barry, please call all men to quarters, including the off-duty watch, and then report to the navigating room. Mr. Eitel will be under my direct orders. We shall descend within the next few minutes."

"Very well, sir."

I pressed the attention button to Eitel's room.

"Mr. Eitel, please pick ten of your best men and have them report at the forward exit. Await me, with the men, at that place. I shall be with you as soon as I turn the command over to Mr. Barry. We are descending immediately."

"Right, sir!" said Eitel.

I turned from the microphone to find that Barry had just entered the navigating room.

"We will descend into the Great Court of the Control City, Mr. Barry," I said. "I have a mission here. I am sorry, but these are the only instructions I can leave you."

"I do not know how long I shall be gone from the ship, but if I do not return within three hours, depart without me, and report directly to Kellen of the Council. To him, and no other. Tell him, verbally, what took place. Should there be any concerted action against the *Tamon*, use your own judgment as to the

action to be taken, remembering that the safety of the ship and its crew, and the report of the Council, are infinitely more important than my personal welfare. Is that clear?"

"Yes, sir. Too damned clear."

I smiled and shook my head.

"Don't worry," I said lightly. "I'll be back well within the appointed time."

"I hope so. But there's something wrong as hell here. I'm talking now as man to man; not to my commanding officer. I've been watching below, and I have seen at least two spots where large numbers of our ships have been destroyed. The remaining ships bear their own damned emblem where the crest of the Alliance should be—and was. What does it mean?"

"It means," I said slowly, "that I shall have to rely upon every man and officer to forget himself and myself, and obey orders without hesitation and without flinching. The orders are not mine, but direct

from the Council itself." I held out my hand to him—an ancient Earth gesture of greeting, good-will and farewell—and he shook it vigorously.

"God go with you," he said softly, and with a little nod of thanks I turned and quickly left the room.

Eitel, with his ten men, were waiting for me at the forward exit. The men fell back a few paces and came to attention; Eitel saluted smartly.

"We are ready, sir. What are your orders?"

"You are to guard this opening. Under no circumstances is anyone to enter save myself. I shall be gone not longer than three hours; if I am not back within that time, Mr. Barry has his orders. The exit will be sealed, and the *Tamon* will depart immediately, without me."

"Yes, sir. You will pardon me, but I gather that your mission is a dangerous one. May I not accompany you?"

I shook my head.

"I shall need you here."

"But, sir, they are very excited and angry; I have been watching them from the observation ports. And there is a vast crowd of them around the ship."

"I had expected that. I thank you for your concern, but I must go alone. Those are the orders. Will you unseal the exit?"

His "Yes, sir!" was brisk and efficient, but there was a worried frown on his features as he unlocked and released the switch that opened the exit.

The huge plug of metal, some ten feet in diameter, revolved swiftly and noiselessly, backing slowly in its fine threads into the interior of the ship, gripped by the ponderous gimbals which, as the last threads disengaged, swung the mighty disc to one side, like the door of some great safe.

"Remember your orders," I smiled, and with a little

gesture to convey an assurance which I certainly did not feel, I strode through the circular opening out into the crowd. The heavy glass secondary door shot down behind me, and I was in the hands of the enemy.

The first thing I observed was that my menore, which I had picked up on my way to the exit, was not functioning. Not a person in all that vast multitude wore a menore; the five black-robed dignitaries who marched to meet me wore none.

Nothing could have showed more clearly that I was in for trouble. To invite a visitor, as Kellen had done, to remove his menore first, was, of course, a polite and courteous thing to do if one wished to communicate by speech; to remove the menore before greeting a visitor wearing one, was a tacit admission of rank enmity; a confession that one's thoughts were to be concealed.

My first impulse was to snatch off my own instrument and fling it in the solemn, ugly faces of the nearest of the five dignitaries; I remembered Kellen's warning just in time. Quietly, I removed the metal circlet and

tucked it under my arm, bowing slightly to the committee of five as I did so.

"I am Ja Ben," said the first of the five, with an evil grin. "You are the representative of the Council that we commanded to appear?"

"I am John Hanson, commander of the ship *Tamon* of the Special Patrol Service. I am here to represent the Central Council," I replied with dignity.

"As we commanded," grinned Ja Ben. "That is good. Follow us and you shall have the evidence you were promised."

Ja Ben led the way with two of his black-robed followers. The other two fell in behind me. A virtual prisoner, I marched between them, through the vast crowd that made way grudgingly to let us pass.

I have seen the people of most of the planets of the known Universe. Many of them, to Earth notions, are odd. But these people, so much like us in many respects, were strangely repulsive.

Their heads, as Ame Baove had recorded, were not round like ours, but possessed a high bony crest that ran from between their lashless, browless eyes, down to the very nape of their necks. Their skin, even that covering their hairless heads, was a dull and papery white, like parchment, and their eyes were abnormally small, and nearly round. A hateful, ugly people, perpetually scowling, snarling; their very voices resembled more the growl of wild beasts than the speech of intelligent beings.

Ja Ben led the way straight to the low but vast building of dun-colored stone that I knew was the administration building of the Control City. We marched up the broad, crowded steps, through the muttering, jeering multitude into the building itself. The guards at the doors stood aside to let us through and the crowd at last was left behind.

A swift, cylindrical elevator shot us upward, into a great glass-walled laboratory, built like a sort of penthouse on the roof. Ja Ben walked quickly across the room towards a long, glass-topped table; the other four closed in on me silently but suggestively.

"That is unnecessary," I said quietly. "See, I am unarmed and completely in your power. I am here as an ambassador of the Central Council, not as a warrior."

"Which is as well for you," grinned Ja Ben. "What I have to show you, you can see quickly, and then depart."

From a great cabinet in one corner of the room he took a shining cylinder of dark red metal, and held it up before him, stroking its sleek sides with an affectionate hand.

"Here it is," he said, chuckling. "The secret of our power. In here, safely imprisoned now, but capable of being released at our command, is death for every living thing upon any planet we choose to destroy." He replaced the great cylinder in the cabinet, and picked up in its stead a tiny vial of the same metal, no larger than my little finger, and not so long. "Here," he said, turning again towards me, "is the means of proving our power to you. Come closer!"

With my bodyguard of four watching every move, I approached.

Ja Ben selected a large hollow hemisphere of crystal glass and placed it upon a smooth sheet of flat glass. Next he picked a few blossoms from a bowl that stood, incongruously enough, on the table, and threw them under the glass hemisphere.

"Flora," he grinned.

Hurrying to the other end of the room, he reached into a large flat metal cage and brought forth three small rodent like animals, natives of that world. These he also tossed carelessly under the glass.

"Fauna," he grunted, and picked up the tiny metal vial.

One end of the vial unscrewed. He turned the cap gently, carefully, a strained, anxious look upon his face. My four guards watched him breathlessly, fearfully.

The cap came loose at last, disclosing the end of the tube, sealed with a grayish substance that looked like wax. Very quickly Ja Ben rolled the little cylinder under the glass hemisphere, and picked up a beaker that had been bubbling gently on an electric plate close by. Swiftly he poured the thick contents of the beaker around the base of the glass bell. The stuff hardened almost instantly, forming an air-tight seal between the glass hemisphere and the flat plate of glass upon which it rested. Then, with an evil, triumphant smile, Ja Ben looked up.

"*Flora*," he repeated. "*Fauna*. And *death*. Watch! The little metal cylinder is plugged still, but in a moment that plug will disappear—simply a volatile solid, you understand. It is going rapidly ... rapidly ... it is almost gone now! Watch ... In an instant now ... *ah!*"

I saw the gray substance that stopped the entrance of the little metal vial disappear. The rodents ran around and over it, trying to find a crevice by which they might escape. The flowers, bright and beautiful, lay untidily on the bottom of the glass prison.

Then, just as the last vestige of the gray plug vanished; an amazing, a terrible thing happened. At the mouth of the tiny metal vial a greenish cloud appeared. I call it a cloud, but it was not that. It was solid, and it spread in every direction, sending out little needles that lashed about and ran together into a solid mass while millions of little needles reached out swiftly.

One of these little needles touched a scurrying animal. Instantly the tiny brute stiffened, and from his entire body the greenish needles spread swiftly. One of the flowers turned suddenly thick and pulpy with the soft green mass, then another, another of the rodents ... *God!*

In the space of two heart beats, the entire hemisphere was filled with the green mass, that still moved and writhed and seemed to press against the glass sides as though the urge to expand was insistent, imperative....

"What is it?" I whispered, still staring at the thing.

"*Death!*" grunted Ja Ben, thrusting his hateful face close to mine, his tiny round eyes, with their lashless lids glinting. "Death, my friend. Go and tell your great Council of this death that we have created for every planet that will not obey us.

"We have gone back into the history of dealing death and have come back with a death such as the Universe has never known before!

"Here is a rapacious, deadly fungus we have been two centuries in developing. The spores contained in that tiny metal tube would be invisible to the naked eye—and yet given but a little time to grow, with air and vegetation and flesh to feed upon, and even that small capsule would wipe out a world. And in the cabinet,"—he pointed grinning triumphantly—"we have, ready for instant use, enough of the spores of this deadly fungus to wipe out all the worlds of your great Alliance.

"To wipe them out utterly!" he repeated, his voice shaking with a sort of frenzy now. "Every living thing upon their faces, wrapped in that thin, hungry green

stuff you see there under that glass. All life wiped out; made uninhabitable so long as the Universe shall endure. And we—we shall be rulers, unquestioned, of that Universe. Tell your doddering Council *that!*" He leaned back against the table, panting with hate.

"I shall tell them all I have seen; all you have said," I nodded.

"You believe we have the power to do all this?"

"I do—God help me, and the Universe," I said solemnly.

There was no doubt in my mind. I could see all too clearly how well their plans had been laid; how quickly this hellish growth would strangle all life, once its spores began to develop.

The only possible chance was to get back to the Council and make my report, with all possible speed, so that every available armed ship of the universe might concentrate here, and wipe out these people before they had time to—

"I know what you are thinking, my friend," broke in Ja Ben mockingly. "You might as well have worn the menore! You would have the ships of the Alliance destroy us before we have time to act. We had foreseen that, and have provided for the possibility.

"As soon as you leave here, ships, provided with many tubes like the one just used for our little demonstration, will be dispersed in every direction. We shall be in constant communication with those ships, and at the least sign of hostility, they will be ordered to depart and spread their death upon every world they can reach. Some of them you may be able to locate and eliminate; a number of them are certain to elude capture in infinite space—and if only one, one lone ship, should escape, the doom of the Alliance and millions upon millions of people will be pronounced.

"I warn you, it will be better, much better, to bow to our wishes, and pay us the tribute we shall demand. Any attempt at resistance will precipitate certain disaster for your Council and all the worlds the Council governs."

"At least, we would wipe you out first," I said hoarsely.

"True," nodded Ja Ben. "But the vengeance of our ships would be a terrible thing! You would not dare to take the chance!"

I stood there, staring at him in a sort of daze. What he had said was so true; terribly, damnably true.

If only—

There was but one chance I could see, and desperate as it was, I took it. Whirling the heavy metal ring of my menore in my hand, I sprang towards the table.

If I could break the sealed glass hemisphere, and loose the fungus upon its creators; deal to them the doom they had planned for the universe, then perhaps all might yet be well.

Ja Ben understood instantly what was in my mind. He and his four aides leaped between me and the table, their tiny round eyes blazing with anger. I struck one of the four viciously with the menore, and with a gasp

he fell back and slumped to the floor.

Before I could break through the opening, however, Ja Ben struck me full in the face with his mighty fist; a blow that sent me, dazed and reeling, into a corner of the room. I brought up with a crash against the cabinet there, groped wildly in an effort to steady myself, and fell to the floor. Almost before I struck, all four of them were upon me.

They hammered me viciously, shouted at me, cursed me in the universal tongue, but I paid no heed. I pretended to be unconscious, but my heart was beating high with sudden, glorious hope, and in my brain a terrible, merciless plan was forming.

When I had groped against the cabinet in an effort to regain my balance, my fingers had closed upon one of the little metal vials. As I fell, I covered that hand with my body and hastily hid the tiny tube in a deep pocket of my blue and silver Service uniform.

Slowly, after a few seconds, I opened my eyes and looked up at them, helplessly.

"Go, now!" snarled Ja Ben, dragging me to my feet. "Go, and tell your Council we are more than a match for you—and for them." He thrust me, reeling, towards his three assistants. "Take him to his ship, and send aid for Ife Rance, here." He glanced at the still unconscious figure of the victim of my menore, and then turned to me with a last warning.

"Remember, one thing more, my friend: you have disintegrator ray equipment upon your ship. You have the little atomic bombs that won for the Alliance the Second War of the Planets. I know that. But if you make the slightest effort to use them, I shall dispatch a supply of the green death to our ships, and they will depart upon their missions at once. You would take upon yourself a terrible responsibility by making the smallest hostile move.

"Go, now—and when you return, bring with you members of your great Council who will have the power to hear our demands, and see that they are obeyed. And do not keep us waiting over long, for we are an impatient race." He bowed, mockingly, and passed his left hand swiftly before his face, his

people's sign of parting.

I nodded, not trusting myself to speak, and, hemmed in by my three black-robed conductors, was hurried down the elevator and back through the jeering mob to my ship.

The glass secondary door shot up to permit me to enter, and Eitel gripped my shoulder anxiously, his eyes smoldering angrily.

"You're hurt, sir!" he said in his odd, high-pitched voice, staring into my bruised face. "What—"

"It's nothing," I assured him. "Close the exit immediately; we depart at once."

"Yes, sir!" He closed the switch, and the great threaded plug swung gently on its gimbals and began to revolve, swiftly and silently. A little bell sounded sharply, and the great door ceased its motion. Eitel locked the switch and returned the key to his pocket.

"Good. All men are at their stations?" I asked briskly.

"Yes, sir! All except these ten, detailed to guard the exit."

"Have them report to their regular stations. Issue orders to the ray operators that they are to instantly, and without further orders, destroy any ship that may leave the surface of this planet. Have every atomic bomb crew ready for an instant and concentrated offensive directed at the Control City, but command them not to act under any circumstances unless I give the order. Is that clear, Mr. Eitel?"

"Yes, sir!"

I nodded, and turned away, making my way immediately to the navigating room.

"Mr. Barry," I said quickly and gravely, "I believe that the fate of the known Universe depends upon us at this moment. We will ascend vertically, at once—slowly—until we are just outside the envelope, maintaining only sufficient horizontal motion to keep us directly over the Control City. Will you give the necessary orders?"

"Immediately, sir!" He pressed the attention button to the operating room and spoke swiftly into the microphone; before he completed the order I had left.

We were already ascending when I reached the port forward atomic bomb station. The man in charge, a Zenian, saluted with automatic precision and awaited orders.

"You have a bomb in readiness?" I asked, returning the salute.

"Those were my orders, sir."

"Correct. Remove it, please."

I waited impatiently while the crew removed the bomb from the releasing trap. It was withdrawn at last; a fish-shaped affair, very much like the ancient airplane bombs save that it was no larger than my two fists, placed one upon the other, and that it had four silvery wires running along its sides, from

rounded nose to pointed tail, held at a distance from the body by a series of insulating struts.

"Now," I said, "how quickly can you put another object in the trap, re-seal the opening, and release the object?"

"While the Commander counts ten with reasonable speed," said the Zenian with pride. "We won first honors in the Special Patrol Service contests at the last Examination, the Commander may remember."

"I do remember. That is why I selected you for this duty."

With hands that trembled a little, I think, I drew forth the little vial of gleaming red metal, while the bombing crew watched me curiously.

"I shall unscrew the cap from this little vial," I explained, "and drop it immediately into the releasing trap. Re-seal the trap and release this object as quickly as it is possible to do so. If you can better the time you made to win the honors at the Examination—

in God's name, do so!"

"Yes, sir!" replied the Zenian. He gave brisk orders to his crew, and each of the three men sprang alertly into position.

As quickly as I could, I turned off the cap of the little metal vial and dropped it into the trap. The heavy plug, a tiny duplicate of the exit door, clicked shut upon it and spun, whining gently, into the opening. Something clicked sharply, and one of the crew dropped a bar into place. As it shot home, the Zenian in command of the crew pulled the release plunger.

"Done, sir!" he said proudly.

I did not reply. My eye fixed upon the observation tube that was following the tiny missile to the ground.

The Control City was directly below us. I lost sight of the vial almost instantly, but the indicating cross-hairs showed me exactly where the vial would strike; at a point approximately half way between the edge of the city and the great squat pile of the administering

building, with its gleaming glass penthouse—the laboratory in which, only a few minutes before, I had witnessed the demonstration of the death which awaited the Universe.

"Excellent!" I exclaimed. "Smartly done, men!" I turned and hurried to the navigating room, where the most powerful of our television discs was located.

The disc was not as perfect as those we have to-day; it was hooded to keep out exterior light, which is not necessary with the later instruments, and it was more unwieldy. However, it did its work, and did it well, in the hands of an experienced operator.

With only a nod to Barry, I turned the range band to maximum, and brought it swiftly to bear upon that portion of the city in which the little vial had fallen. As I drew the focusing lever towards me, the scene leaped at me through the clear, glowing glass disc.

Froth! Green, billowing froth that grew and boiled

and spread unceasingly. In places it reached high into the air, and it moved with an eager, inner life that was somehow terrible and revolting. I moved the range hand back, and the view seemed to drop away from me swiftly.

I could see the whole city now. All one side of it was covered with the spreading green stain that moved and flowed so swiftly. Thousands of tiny black figures were running in the streets, crowding away from the awful danger that menaced them.

The green patch spread more swiftly always. When I had first seen it, the edges were advancing as rapidly as a man could run; now they were fairly racing, and the speed grew constantly.

A ship, two of them, three of them came darting from somewhere, towards the administration building, with its glass cupola. I held my breath as the deep, sudden humming from the *Tamon* told me that our rays were busy. Would they—

One of the enemy ships disappeared suddenly in a

little cloud of dirty, heavy dust that settled swiftly. Another ... and the third. Three little streaks of dust, falling, falling....

A fourth ship, and a fifth came rushing up, their sides faintly glowing from the speed they had made. The green flood, thick and insistent, was racing up and over the administration building now. It reached the roof, ran swiftly....

The fourth ship shattered into dust. The fifth settled swiftly—and then that ship also disappeared, together with a corner of the building. Then the thick green stuff flowed over the whole building and there was nothing to be seen there but a mound of soft, flowing, gray-green stuff that rushed on now with the swiftness of the wind.

I looked up, into Barry's face.

"You're ill!" he said quickly. "Is there anything I can do, sir?"

"Yes," I said, forming the words with difficulty. "Give

orders to ascend at emergency speed!"

For once my first officer hesitated. He glanced at the attraction meter and then turned to me again, wondering.

"At this height, sir, emergency speed will mean dangerous heating of the surface; perhaps—"

"I want it white hot, Mr. Barry. She is built to stand it. Emergency speed, please—immediately!"

"Right, sir!" he said briskly, and gave the order.

I felt my weight increase as the order was obeyed; gradually the familiar, uncomfortable feeling left me. Silently, Barry and I watched the big surface temperature gauge as it started to move. The heat inside became uncomfortable, grew intense. The sweat poured from us. In the operating room forward, I could see the men casting quick, wondering glances up at us through the heavy glass partition that lay between.

The thick, stubby red hand of the surface temperature gauge moved slowly but steadily towards the heavy red line that marked the temperature at which the outer shell of our hull would become incandescent. The hand was within three or four degrees of that mark when I gave Barry the order to arrest our motion.

When he had given the order, I turned to him and motioned towards the television disc.

"Look," I said.

He looked, and when at last he tore his face away from the hood, he seemed ten years older.

"What is it?" he asked in a choked whisper. "Why—they're being wiped out; the whole of that world—"

"True. And some of the seeds of that terrible death might have drifted upward, and found a lodging place upon the surface of our ship. That is why I ordered the emergency speed while we were still within the atmospheric envelope, Barry. To burn away that

contamination, if it existed. Now we are safe, unless
—"

I pressed the attention button to the station of the chief of the ray operators.

"Your report," I ordered.

"Nine ships disintegrated, sir," he replied instantly.

"Five before the city was destroyed, four later."

"You are certain that none escaped?"

"Positive, sir."

"Very good."

I turned to Barry, smiling.

"Point her nose for Zenia, Mr. Barry," I said. "As soon as it is feasible, resume emergency speed. There are some very anxious gentlemen there awaiting our report, and I dare not convey it except in person."

"Yes, sir!" said Barry crisply.

This, then, is the history of the Forgotten Planet. On the charts of the Universe it appears as an unnamed world. No ship is permitted to pass close enough to it so that its attraction is greater than that of the nearest other mass. A permanent outpost of fixed-station ships, with headquarters upon Jaron, the closest world, is maintained by the Council.

There are millions of people who might be greatly disturbed if they knew of this potential menace that lurks in the midst of our Universe, but they do not know. The wisdom of the Council made certain of that.

But, in order that in the ages to come there might be a record of this matter, I have been asked to prepare this document for the sealed archives of the Alliance. It has been a pleasant task; I have relived, for a little time, a part of my youth.

The work is done, now, and that is well. I am an old man, and weary. Sometimes I wish I might live to see the wonders that the next generation or so will witness, but my years are heavy upon me.

My work is done.

#40 The Power And The Glory, By Charles Willard Diffin:

Sadly, sternly, the old professor reveals to his brilliant pupil the greater path to glory.

Aproximate word count:

Bigotry:

Warnings:

[Image description start: A black and white illustration showing a young man sitting in a chair in front of a table of scientific equipment, his head in one hand in despair, while an older man stands above him with his hand on the younger man's shoulder consolingly, his other wrist held across his chest, showing he is missing that hand. Image description end.]

There were papers on the desk, a litter of papers scrawled over, in the careless writing of indifferent students, with the symbols of chemistry and long mathematical computations. The man at the desk pushed them aside to rest his lean, lined face on one

thin hand. The other arm, ending at the wrist, was on the desk before him.

Students of a great university had long since ceased to speculate about the missing hand. The result of an experiment, they knew—a hand that was a mass of lifeless cells, amputated quickly that the living arm might be saved—but that was some several years ago, ancient history to those who came and went through Professor Eddinger's class room.

And now Professor Eddinger was weary—weary and old, he told himself—as he closed his eyes to shut out the sight of the interminable papers and the stubby wrist that had ended forever his experiments and the delicate manipulations which only he could do.

He reached slowly for a buzzing phone, but his eyes brightened at the voice that came to him.

"I've got it—I've got it!" The words were almost incoherent. "This is Avery, Professor—Avery! You must come at once. You will share in it; I owe it all to you ... you will be the first to see ... I am sending a taxi for

you—”

Professor Eddinger’s tired eyes crinkled to a smile. Enthusiasm like this was rare among his youngsters. But Avery—with the face of a poet, a dreamer’s eyes and the mind of a scientist—good boy, Avery!—a long time since he had seen him—had him in his own laboratory for two years....

“What’s this all about?” he asked.

“No—no!” said a voice; “I can’t tell you—it is too big—greater than the induction motor—greater than the electric light—it is the greatest thing in the world. The taxi should be there now—you must come—”

A knock at the office door where a voice said, “Car for Professor Eddinger,” confirmed the excited words.

“I’ll come,” said the Professor, “right away.”

He pondered, as the car whirled him across the city, on what this greatest thing in the world might be. And he hoped with gentle skepticism that the enthusiasm

was warranted. A young man opened the car door as they stopped. His face was flushed, Eddinger noted, hair pushed back in disarray, his shirt torn open at the throat.

“Wait here,” he told the driver and took the Professor by the arm to hurry him into a dilapidated building.

“Not much of a laboratory,” he said, “but we’ll have better, you and I; we’ll have better—”

The room seemed bare with its meager equipment, but it was neat, as became the best student of Professor Eddinger. Rows of reagent bottles stood on the shelves, but the tables were a litter of misplaced instruments and broken glassware where trembling hands had fumbled in heedless excitement.

“Glad to see you again, Avery.” The gentle voice of Professor Eddinger had lost its tired tone. “It’s been two years you’ve been working, I judge. Now what is this great discovery, boy? What have you found?”

The younger man, in whose face the color came and

went, and whose eyes were shining from dark hollows that marked long days and sleepless nights, still clung to the other's arm.

"It's real," he said; "it's great! It means fortune and fame, and you're in on that, Professor. The old master," he said and clapped a hand affectionately upon a thin shoulder; "I owe it all to you. And now I have—I have learned.... No, you shall see for yourself. Wait—"

He crossed quickly to a table. On it was an apparatus; the eyes of the older man widened as he saw it. It was intricate—a maze of tubing. There was a glass bulb above—the generator of a cathode ray, obviously—and electro-magnets below and on each side. Beneath was a crude sphere of heavy lead—a retort, it might be—and from this there passed two massive, insulated cables. The understanding eyes of the Professor followed them, one to a terminal on a great insulating block upon the floor, the other to a similarly protected terminal of carbon some feet above it in the air.

The trembling fingers of the young man made some

few adjustments, then he left the instrument to take his place by an electric switch. “Stand back,” he warned, and closed the switch.

There was a gentle hissing from within glass tubes, the faint glow of a blue-green light. And that was all, until—with a crash like the ripping crackle of lightning, a white flame arced between the terminals of the heavy cables. It hissed ceaselessly through the air where now the tang of ozone was apparent. The carbon blocks glowed with a brilliant incandescence when the flame ceased with the motion of a hand where Avery pulled a switch.

The man’s voice was quiet now. “You do not know, yet, what you have seen, but there was a tremendous potential there—an amperage I can’t measure with my limited facilities.” He waved a deprecating hand about the ill-furnished laboratory. “But you have seen —” His voice trembled and failed at the forming of the words.

“—The disintegration of the atom,” said Professor Eddinger quietly, “and the release of power unlimited.

Did you use thorium?" he inquired.

The other looked at him in amazement. Then: "I should have known you would understand," he said humbly. "And you know what it means"—again his voice rose—"power without end to do the work of the world—great vessels driven a lifetime on a mere ounce of matter—a revolution in transportation—in living...." He paused. "The liberation of mankind," he added, and his voice was reverent. "This will do the work of the world: it will make a new heaven and a new earth! Oh, I have dreamed dreams," he exclaimed, "I have seen visions. And it has been given to me—me!—to liberate man from the curse of Adam ... the sweat of his brow.... I can't realize it even yet. I—I am not worthy...."

He raised his eyes slowly in the silence to gaze in wondering astonishment at the older man. There was no answering light, no exaltation on the lined face. Only sadness in the tired eyes that looked at him and through him as if focused upon something in a dim future—or past.

“Don’t you see?” asked the wondering man. “The freedom of men—the liberation of a race. No more poverty, no endless, grinding labor.” His young eyes, too, were looking into the future, a future of blinding light. “Culture,” he said, “instead of heart-breaking toil, a chance to grow mentally, spiritually; it is another world, a new life—” And again he asked: “Surely, you see?”

“I see,” said the other; “I see—plainly.”

“The new world,” said Avery. “It—it dazzles me; it rings like music in my ears.”

“I see no new world,” was the slow response.

The young face was plainly perplexed. “Don’t you believe?” he stammered. “After you have seen ... I thought you would have the vision, would help me emancipate the world, save it—” His voice failed.

“Men have a way of crucifying their saviors,” said the tired voice.

The inventor was suddenly indignant. “You are blind,” he said harshly; “it is too big for you. And I would have had you stand beside me in the great work.... I shall announce it alone.... There will be laboratories—enormous!—and factories. My invention will be perfected, simplified, compressed. A generator will be made—thousands of horsepower to do the work of a city, free thousands of men—made so small you can hold it in one hand.”

The sensitive face was proudly alight, proud and a trifle arrogant. The exaltation of his coming power was strong upon him.

“Yes,” said Professor Eddinger, “in one hand.” And he raised his right arm that he might see where the end of a sleeve was empty.

“I am sorry,” said the inventor abruptly; “I didn’t mean ... but you will excuse me now; there is so much to be done—” But the thin figure of Professor Eddinger had crossed to the far table to examine the apparatus there.

“Crude,” he said beneath his breath, “crude—but efficient!”

In the silence a rat had appeared in the distant corner. The Professor nodded as he saw it. The animal stopped as the man’s eyes came upon it; then sat squirrellike on one of the shelves as it ate a crumb of food. Some morsel from a hurried lunch of Avery’s, the Professor reflected—poor Avery! Yes, there was much to be done.

He spoke as much to himself as to the man who was now beside him. “It enters here,” he said and peered downward toward the lead bulb. He placed a finger on the side of the metal. “About here, I should think.... Have you a drill? And a bit of quartz?”

The inventor’s eyes were puzzled, but the assurance of his old instructor claimed obedience. He produced a small drill and a fragment like broken glass. And he started visibly as the one hand worked awkwardly to make a small hole in the side of the lead. But he withdrew his own restraining hand, and he watched in mystified silence while the quartz was fitted to

make a tiny window and the thin figure stooped to sight as if aiming the opening toward a far corner where a brown rat sat upright in earnest munching of a dry crust.

The Professor drew Avery with him as he retreated noiselessly from the instrument. “Will you close the switch,” he whispered.

The young man hesitated, bewildered, at this unexpected demonstration, and the Professor himself reached with his one hand for the black lever. Again the arc crashed into life, to hold for a brief instant until Professor Eddinger opened the switch.

“Well,” demanded Avery, “what’s all the show? Do you think you are teaching me anything—about my own instrument?” There was hurt pride and jealous resentment in his voice.

“See,” said Professor Eddinger quietly. And his one thin hand pointed to a far shelf, where, in the shadow, was a huddle of brown fur and a bit of crust. It fell as they watched, and the “plop” of the soft body upon

the floor sounded loud in the silent room.

“The law of compensation,” said Professor Eddinger.
“Two sides to the medal! Darkness and light—good
and evil—life ... and death!”

The young man was stammering. “What do you mean?
—a death ray evolved?” And: “What of it?” he
demanded; “what of it? What’s that got to do with it?”

“A death ray,” the other agreed. “You have dreamed,
Avery—one must in order to create—but it is only a
dream. You dreamed of life—a fuller life—for the
world, but you would have given them, as you have
just seen, death.”

The face of Avery was white as wax; his eyes glared
savagely from dark hollows.

“A rat!” he protested. “You have killed a rat ... and
you say—you say—” He raised one trembling hand to
his lips to hold them from forming the unspeakable
words.

"A rat," said the Professor—"or a man ... or a million men."

"We will control it."

"All men will have it—the best and the worst ... and there is no defence."

"It will free the world—"

"It will destroy it."

"No!"—and the white-faced man was shouting now—"you don't understand—you can't see—"

The lean figure of the scientist straightened to its full height. His eyes met those of the younger man, silent now before him, but Avery knew the eyes never saw him; they were looking far off, following the wings of thought. In the stillness the man's words came harsh and commanding—

"Do you see the cities," he said, "crumbling to ruins under the cold stars? The fields? They are rank with

wild growth, torn and gullied by the waters; a desolate land where animals prowl. And the people—the people!—wandering bands, lower, as the years drag on, than the beasts themselves; the children dying, forgotten, in the forgotten lands; a people to whom the progress of our civilization is one with the ages past, for whom there is again the slow, toiling road toward the light.

"And somewhere, perhaps, a conquering race, the most brutal and callous of mankind, rioting in their sense of power and dragging themselves down to oblivion...."

His gaze came slowly back to the room and the figure of the man still fighting for his dream.

"They would not," said Avery hoarsely; "they'd use it for good."

"Would they?" asked Professor Eddinger. He spoke simply as one stating simple facts. "I love my fellow men," he said, "and I killed them in thousands in the last war—I, and my science, and my poison gas."

The figure of Avery slumped suddenly upon a chair; his face was buried in his hands. "And I would have been," he groaned, "the greatest man in the world."

"You shall be greater," said the Professor, "though only we shall know it—you and I.... You will save the world—from itself."

The figure, bowed and sunken in the chair, made no move; the man was heedless of the kindly hand upon his shoulder. His voice, when he spoke, was that of one afar off, speaking out of a great loneliness. "You don't understand," he said dully; "you can't—"

But Professor Eddinger, a cog in the wheels of a great educational machine, glanced at the watch on his wrist. Again his thin shoulders were stooped, his voice tired. "My classes," he said. "I must be going...."

In the gathering dusk Professor Eddinger locked carefully the door of his office. He crossed beyond his desk and fumbled with his one hand for his keys.

There was a cabinet to be opened, and he stared long in the dim light at the object he withdrew. He looked approvingly at the exquisite workmanship of an instrument where a generator of the cathode ray and an intricate maze of tubing surmounted electromagnets and a round lead bulb. There were terminals for attaching heavy cables; it was a beautiful thing.... His useless arm moved to bring an imaginary hand before the window of quartz in the lead sphere.

“Power,” he whispered and repeated Avery’s words; “power, to build a city—or destroy a civilization ... and I hold it in one hand.”

He replaced the apparatus in the safety of its case. “The saviors of mankind!” he said, and his tone was harsh and bitter.

But a smile, whimsical, kindly, crinkled his tired eyes as he turned to his desk and its usual litter of examination papers.

“It is something, Avery,” he whispered to that distant man, “to belong in so distinguished a group.”

August 1930

#41 The Planet Of Dread, By Roman Frederick Starzl:

A stupid blunder—and Mark Forepaugh faces a lifetime of castaway loneliness in the savage welter of the planet Inra's monster-ridden jungles.

Aproximate word count:

Bigotry:

Warnings:

- - -

There was no use hiding from the truth. Somebody had blundered—a fatal blunder—and they were going to pay for it! Mark Forepaugh kicked the pile of hydrogen cylinders. Only a moment ago he had broken the seals—the mendacious seals that certified to the world that the flasks were fully charged. And the flasks were empty! The supply of this precious power gas, which in an emergency should have been sufficient for six years, simply did not exist.

He walked over to the integrating machine, which as early as the year 2031 had begun to replace the older atomic processes, due to the shortage of the radium series metals. It was bulky and heavy compared to the atomic disintegrators, but it was much more economical and very dependable. Dependable—provided some thick-headed stock clerk at a terrestrial supply station did not check in empty hydrogen cylinders instead of full ones. Forepaugh's unwonted curses brought a smile to the stupid, good-natured face of his servant, Gunga—he who had been banished for life from his native Mars for his impiety in closing his single round eye during the sacred Ceremony of the Wells.

The Earth man was at this steaming hot, unhealthful trading station under the very shadow of the South Pole of the minor planet Inra for an entirely different reason. One of the most popular of his set on the Earth, an athletic hero, he had fallen in love, and the devoutly wished-for marriage was only prevented by lack of funds. The opportunity to take charge of this richly paid, though dangerous, outpost of civilization

had been no sooner offered than taken. In another week or two the relief ship was due to take him and his valuable collection of exotic Inranian orchids back to the Earth, back to a fat bonus, Constance, and an assured future.

It was a different young man who now stood tragically before the useless power plant. His slim body was bowed, and his clean features were drawn. Grimly he raked the cooling dust that had been forced in the integrating chamber by the electronic rearrangement of the original hydrogen atoms—finely powdered iron and silicon—the "ashes" of the last tank of hydrogen.

Gunga chuckled.

"What's the matter?" Forepaugh barked. "Going crazy already?"

"Me, haw! Me, haw! Me thinkin'," Gunga rumbled.

"Haw! We got, haw! plenty hydr'gen." He pointed to the low metal roof of the trading station. Though it was well insulated against sound, the place continually vibrated to the low murmur of the

Inranian rains that fell interminably through the perpetual polar day. It was a rain such as is never seen on Earth, even in the tropics. It came in drops as large as a man's fist. It came in streams. It came in large, shattering masses that broke before they fell and filled the air with spray. There was little wind, but the steady green downpour of water and the brilliant continuous flashing of lightning shamed the dull soggy twilight produced by the large, hot, but hidden sun.

"*Your* idea of a joke!" Forepaugh growled in disgust. He understood what Gunga's grim pleasantry referred to. There was indeed an incalculable quantity of hydrogen at hand. If some means could be found to separate the hydrogen atoms from the oxygen in the world of water around them they would not lack for fuel. He thought of electrolysis, and relaxed with a sigh. There was no power. The generators were dead, the air drier and cooler had ceased its rhythmic pulsing nearly an hour ago. Their lights were gone, and the automatic radio utterly useless.

"This is what comes of putting all your eggs in one

basket," he thought, and let his mind dwell vindictively on the engineers who had designed the equipment on which his life depended.

An exclamation from Gunga startled him. The Martian was pointing to the ventilator opening, the only part of this strange building that was not hermetically sealed against the hostile life of Inra. A dark rim had appeared at its margin, a loathsome, black-green rim that was moving, spreading out. It crept over the metal walls like the low-lying smoke of a fire, yet it was a solid. From it emanated a strong, miasmatic odor.

"The giant mold!" Forepaugh cried. He rushed to his desk and took out his flash pistol, quickly set the localizer so as to cover a large area. When he turned he saw, to his horror, Gunga about to smash into the mold with his ax. He sent the man spinning with a blow to the ear.

"Want to scatter it and start it growing in a half-dozen places?" he snapped. "Here!"

He pulled the trigger. There was a light, spiteful "ping" and for an instant a cone of white light stood out in the dim room like a solid thing. Then it was gone, and with it was gone the black mold, leaving a circular area of blistered paint on the wall and an acrid odor in the air. Forepaugh leaped to the ventilating louver and closed it tightly.

"It's going to be like this from now on," he remarked to the shaken Gunga. "All these things wouldn't bother us as long as the machinery kept the building dry and cool. They couldn't live in here. But it's getting damp and hot. Look at the moisture condensing on the ceiling!"

Gunga gave a guttural cry of despair. "It knows, Boss; look!"

Through one of the round, heavily framed ports it could be seen, the lower part of its large, shapeless body half-floating in the lashing water that covered their rocky shelf to a depth of several feet, the upper part spectral and gray. It was a giant amoeba, fully six feet in diameter in its present spheroid form, but

capable of assuming any shape that would be useful. It had an envelope of tough, transparent matter, and was filled with a fluid that was now cloudy and then clear. Near the center there was a mass of darker matter, and this was undoubtedly the seat of its intelligence.

The Earth man recoiled in horror! A single cell with a brain! It was unthinkable. It was a biological nightmare. Never before had he seen one—had, in fact, dismissed the stories of the Inranian natives as a bit of primitive superstition, had laughed at these gentle, stupid amphibians with whom he traded when they, in their imperfect language, tried to tell him of it.

They had called it the Ul-lul. Well, let it be so. It was an amoeba, and it was watching him. It floated in the downpour and watched him. With what? It had no eyes. No matter, it was watching him. And then it suddenly flowed outward until it became a disc rocking on the waves. Again its fluid form changed, and by a series of elongations and contractions it flowed through the water at an incredible speed. It

came straight for the window, struck the thick, unbreakable glass with a shock that could be felt by the men inside. It flowed over the glass and over the building. It was trying to eat them, building and all! The part of its body over the port became so thin that it was almost invisible. At last, its absolute limit reached, it dropped away, baffled, vanishing amid the glare of the lightning and the frothing waters like the shadows of a nightmare.

The heat was intolerable and the air was bad.

"Haw, we have to open vent'lator, Boss!" gasped the Martian.

Forepaugh nodded grimly. It wouldn't do to smother either. Though to open the ventilator would be to invite another invasion by the black mold, not to mention the amoebae and other fabulous monsters that had up to now been kept at a safe distance by the repeller zone, a simple adaptation of a very old discovery. A zone of mechanical vibrations, of a

frequency of 500,000 cycles per second, was created by a large quartz crystal in the water, which was electrically operated. Without power, the protective zone had vanished.

"We watch?" asked Gunga.

"You bet we watch. Every minute of the 'day' and 'night.'"

He examined the two chronometers, assuring himself that they were well wound, and congratulated himself that they were not dependent on the defunct power plant for energy. They were his only means of measuring the passage of time. The sun, which theoretically would seem to travel round and round the horizon, rarely succeeded in making its exact location known, but appeared to shift strangely from side to side at the whim of the fog and water.

"Th' fellas," Gunga remarked, coming out of a study.

"Why not come?" He referred to the Inranians.

"Probably know something's wrong. They can tell the

quartz oscillator is stopped. Afraid of the Ul-lul, I suppose."

"Squeer," demurred the Martian. "Ul-lul not bother fellas."

"You mean it doesn't follow them into the underbrush. But it would find tough going there. Not enough water; trees there, four hundred feet high with thorny roots and rough bark—they wouldn't like that. Oh no, these natives ought to be pretty snug in their dens. Why, they're as hard to catch as a muskrat! Don't know what a muskrat is, huh? Well, it's the same as the Inranians, only different, and not so ugly."

For the next six days they existed in their straitened quarters, one guarding while the other slept, but such alarms as they experienced were of a minor nature, easily disposed of by their flash pistol. It had not been intended for continuous service, and under the frequent drains it showed an alarming loss of power. Forepaugh repeatedly warned Gunga to be more sparing in its use, but that worthy persisted in his practice of using it against every trifling invasion of

the poisonous Inranian cave moss that threatened them, or the warm, soggy water-spiders that hopefully explored the ventilator shaft in search of living food.

"Bash 'em with a broom, or something! Never mind if it isn't nice. Save our flash gun for something bigger."

Gunga only looked distressed.

On the seventh day their position became untenable. Some kind of sea creature, hidden under the ever-replenished storm waters, had found the concrete emplacements of their trading post to its liking. Just how it was done was never learned. It is doubtful that the creatures could gnaw away the solid stone—more likely the process was chemical, but none the less it was effective. The foundations crumbled; the metal shell subsided, rolled half over so that silty water leaked in through the straining seams, and threatened at any moment to be buffeted and urged away on the surface of the flood toward that distant vast sea which covers nine-tenths of the area of Inra.

"Time to mush for the mountains," Forepaugh decided.

Gunga grinned. The Mountains of Perdition were, to his point of view, the only part of Inra even remotely inhabitable. They were sometimes fairly cool, and though perpetually pelted with rain, blazing with lightning and reverberating with thunder, they had caves that were fairly dry and too cool for the black mold. Sometimes, under favorable circumstances on their rugged peaks, one could get the full benefit of the enormous hot sun for whose actinic rays the Martian's starved system yearned.

"Better pack a few cans of the food tablets," the white man ordered. "Take a couple of waterproof sleeping bags for us, and a few hundred fire pellets. You can have the flash pistol; it may have a few more charges in it."

Forepaugh broke the glass case marked "Emergency Only" and removed two more flash pistols. Well he knew that he would need them after passing beyond the trading area—perhaps sooner. His eyes fell on his

personal chest, and he opened it for a brief examination. None of the contents seemed of any value, and he was about to pass when he dragged out a long, heavy, .45 caliber six-shooter in a holster, and a cartridge belt filled with shells. The Martian stared.

"Know what it is?" his master asked, handing him the weapon.

"Gunga not know." He took it and examined it curiously. It was a fine museum piece in an excellent state of preservation, the metal overlaid with the patina of age, but free from rust and corrosion.

"It's a weapon of the Ancients," Forepaugh explained. "It was a sort of family heirloom and is over 300 years old. One of my grandfathers used it in the famous Northwest Mounted Police. Wonder if it'll still shoot."

He leveled the weapon at a fat, sightless wriggler that came squirming through a seam, squinting unaccustomed eyes along the barrel. There was a violent explosion, and the wriggler disappeared in a smear of dirty green. Gunga nearly fell over backward

in fright, and even Forepaugh was shaken. He was surprised that the ancient cartridge had exploded at all, though he knew powder making had reached a high level of perfection before explosive chemical weapons had yielded to the newer, lighter, and infinitely more powerful ray weapons. The gun would impede their progress. It would be of very little use against the giant Carnivora of Inra. Yet something—perhaps a sentimental attachment, perhaps what his ancestors would have called a "hunch"—compelled him to strap it around his waist. He carefully packed a few essentials in his knapsack, together with one chronometer and a tiny gyroscopic compass. So equipped, they could travel with a fair degree of precision toward the mountains some hundred miles on the other side of a steaming forest, a-crawl with feral life, and hot with blood-lust.

Man and master descended into the warm waters and, without a backward glance, left the trading post to its fate. There was not even any use in leaving a note. Their relief ship, soon due, would never find the station without radio direction.

The current was strong, but the water gradually became shallower as they ascended the sloping rock. After half an hour they saw ahead of them the loom of the forest, and with some trepidation they entered the gloom cast by the towering, fernlike trees, whose tops disappeared in murky fog. Tangled vines impeded their progress. Quagmires lay in wait for them, and tough weeds tripped them, sometimes throwing one or another into the mud among squirming small reptiles that lashed at them with spiked, poisonous feet and then fell to pieces, each piece to lie in the bubbling ooze until it grew again into a whole animal.

Several times they almost walked under the bodies of great, spheroidal creatures with massive short legs, whose tremendously long, sinuous necks disappeared in the leafy murk above, swaying gently like long-stalked lilies in a terrestrial pond. These were azornacks, mild-tempered vegetarians whose only defense lay in their thick, blubbery hides. Filled with parasites, stinking and rancid, their decaying covering of fat effectively concealed the tender flesh underneath, protecting them from fangs and rending

claws.

Deeper in the forest the battering of the rain was mitigated. Giant neo-palm leaves formed a roof that shut out not only most of the weak daylight, but also the fury of the downpour. The water collected in cataracts, ran down the boles of the trees, and roared through the semi-circular canals of the snake trees, so named by early explorers for their waving, rubbery tentacles, multiplied a millionfold, that performed the duties of leaves. Water gurgled and chuckled everywhere, spread in vast dim ponds and lakes writhing with tormented roots, up-heaved by unseen, uncatalogued leviathans, rippled by translucent discs of loathsome, luminescent jelly that quivered from place to place in pursuit of microscopic prey.

Yet the impression was one of calm and quiet, and the waifs from other worlds felt a surcease of nervous tension. Unconsciously they relaxed. Taking their bearings, they changed their course slightly for the nesting place of the nearest tribe of Inranians where they hoped to get food and at least partial shelter; for their food tablets had mysteriously turned to an

unpleasant viscous liquid, and their sleeping bags were alive with giant bacteria easily visible to the eye.

They were doomed to disappointment. After nearly twelve hours of desperate struggling through the morass, through gloomy aisles, and countless narrow escapes from prowling beasts of prey in which only the speed and tremendous power of their flash pistols saved them from instant death, they reached a rocky outcropping which led to the comparatively dry rise of land on which a tribe of Inranians made its home. Their faces were covered with welts made by the hanging filaments of blood-sucking trees as fine as spider webs, and their senses reeled with the oppressive stench of the abysmal jungle. If the pampered ladies of the Inner Planets only knew where their thousand-dollar orchids sprang from!

Converging runways showed the opening of one of the underground dens, almost hidden from view by a bewildering maze of roots, rendered more formidable by long, sharp stakes made from the iron-hard thigh-bones of the flying kabo.

Forepaugh cupped his hands over his mouth and gave the call.

"Ouf! Ouf! Ouf! Ouf! Ouf!"

He repeated it over and over, the jungle giving back his voice in a muffled echo, while Gunga held a spare flash pistol and kept a sharp lookout for a carnivore intent on getting an unwary Inranian.

There was no answer. These timid creatures, who are often rated the most intelligent life native to primitive Inra, had sensed disaster and had fled.

Forepaugh and Gunga slept in one of the foul, poorly ventilated dens, ate of the hard, woody tubers that had not been worth taking along, and wished they had a certain stock clerk at that place at that time. They were awakened out of deep slumber by the threshing of an evil looking creature which had become entangled among the sharpened spikes. Its tremendous maw, splitting it almost in half, was opened in roars of pain that showed great yellow fangs eight inches in length. Its heavy flippers

battered the stout roots and lacerated themselves in the beast's insensate rage. It was quickly dispatched with a flash pistol and Gunga cooked himself some of the meat, using a fire pellet; but despite his hunger Forepaugh did not dare eat any of it, knowing that this species, strange to him, might easily be one of the many on Inra that are poisonous to terrestrials.

They resumed their march toward the distant invisible mountains, and were fortunate in finding somewhat better footing than they had on their previous march. They covered about 25 miles on that "day," without untoward incident. Their ray pistols gave them an insuperable advantage over the largest and most ferocious beasts they could expect to meet, so that they became more and more confident, despite the knowledge that they were rapidly using up the energy stored in their weapons. The first one had long ago been discarded, and the charge indicators of the other two were approaching zero at a disquieting rate. Forepaugh took them both, and from that time on he was careful never to waste a discharge except in case of a direct and unavoidable

attack. This often entailed long waits or stealthy detours through sucking mud, and came near to ending both their lives.

The Earth man was in the lead when it happened. Seeking an uncertain footing through a tangle of low-growing, thick, ghastly white vegetation, he placed a foot on what seemed to be a broad, flat rock projecting slightly above the ooze. Instantly there was a violent upheaval of mud; the seeming rock flew up like a trap-door, disclosing a cavernous mouth some seven feet across, and a thick, triangular tentacle flew up from its concealment in the mud in a vicious arc. Forepaugh leaped back barely in time to escape being swept in and engulfed. The end of the tentacle struck him a heavy blow on the chest, throwing him back with such force as to bowl Gunga over, and whirling the pistols out of his hands into a slimy, bulbous growth nearby, where they stuck in the phosphorescent cavities the force of their impact had made.

There was no time to recover the weapons. With a bellow of rage the beast was out of its bed and rushing at them. Nothing stayed its progress. Tough, heavily scaled trees thicker than a man's body shuddered and fell as its bulk brushed by them. But it was momentarily confused, and its first rush carried it past its dodging quarry. This momentary respite saved their lives.

Rearing its plumed head to awesome heights, its knobby bark running with brown rivulets of water, a giant tree, even for that world of giants, offered refuge. The men scrambled up the rough trunk easily, finding plenty of hand and footholds. They came to rest on one of the shelflike circumvoluting rings, some twenty-five feet above the ground. Soon the blunt brown tentacles slithered in search of them, but failed to reach their refuge by inches.

And now began the most terrible siege that interlopers in that primitive world can endure. From that cavernous, distended throat came a tremendous, world-shaking noise.

"HOOM! HOOM! HOOM! HOOM! HOOM! HOOM!"

Forepaugh put his hand to his head. It made him dizzy. He had not believed that such noise could be. He knew that no creature could long live amidst it. He tore strips from his shredded clothing and stuffed his ears, but felt no relief.

"HOOM! HOOM! HOOM! HOOM! HOOM!"

It throbbed in his brain.

Gunga lay a-sprawl, staring with fascinated eye into the pulsating scarlet gullet that was blasting the world with sound. Slowly, slowly he was slipping. His master hauled him back. The Martian grinned at him stupidly, slid again to the edge.

Once more Forepaugh pulled him back. The Martian seemed to acquiesce. His single eye closed to a mere slit. He moved to a position between Forepaugh and the tree trunk, braced his feet.

"No you don't!" The Earth man laughed uproariously.

The din was making him light-headed. It was so funny! Just in time he had caught that cunning expression and prepared for the outlashing of feet designed to plunge him into the red cavern below and to stop that hellish racket.

"And now—"

He swung his fist heavily, slamming the Martian against the tree. The red eye closed wearily. He was unconscious, and lucky.

Hungrily the Earth man stared at his distant flash pistols, plainly visible in the luminescence of their fungus bedding. He began a slow, cautious creep along the top of a vine some eight inches thick. If he could reach them....

Crash! He was almost knocked to the ground by the thud of a frantic tentacle against the vine. His movement had been seen. Again the tentacle struck with crushing force. The great vine swayed. He managed to reach the shelf again in the very nick of time.

"HOOM! HOOM! HOOM! HOOM! HOOM!"

A bolt of lightning struck a giant fern some distance away. The crash of thunder was hardly noticeable. Forepaugh wondered if his tree would be struck. Perhaps it might even start a fire, giving him a flaming brand with which to torment his tormentor. Vain hope! The wood was saturated with moisture. Even the fire pellets could not make it burn.

"HOOM! HOOM! HOOM! HOOM! HOOM! HOOM!
HOOM!"

The six-shooter! He had forgotten it. He jerked it from its holster and pointed it at the red throat, emptied all the chambers. He saw the flash of yellow flame, felt the recoil, but the sound of the discharges was drowned in the Brobdignagian tumult. He drew back his arm to throw the useless toy from him. But again that unexplainable, senseless "hunch" restrained him. He reloaded the gun and returned it to its holster.

"HOOM! HOOM! HOOM! HOOM! HOOM! HOOM!"

A thought had been struggling to reach his consciousness against the pressure of the unbearable noise. The fire pellets! Couldn't they be used in some way? These small chemical spheres, no larger than the end of his little finger, had long ago supplanted actual fire along the frontiers, where electricity was not available for cooking. In contact with moisture they emitted terrific heat, a radiant heat which penetrated meat, bone, and even metal. One such pellet would cook a meal in ten minutes, with no sign of scorching or burning. And they had several hundred in one of the standard moisture-proof containers.

As fast as his fingers could work the trigger of the dispenser Forepaugh dropped the potent little pellets down the bellowing throat. He managed to release about thirty before the bellowing stopped. A veritable tornado of energy broke loose at the foot of the tree. The giant maw was closed, and the shocking silence was broken only by the thrashing of a giant body in its death agonies. The radiant heat, penetrating through and through the beast's body, withered nearby

vegetation and could be easily felt on the perch up the tree.

Gunga was slowly recovering. His iron constitution helped him to rally from the powerful blow he had received, and by the time the jungle was still he was sitting up mumbling apologies.

"Never mind," said his master. "Shin down there and cut us off a good helping of roast tongue, if it has a tongue, before something else comes along and beats us out of a feast."

"Him poison, maybe," Gunga demurred. They had killed a specimen new to zoologists.

"Might as well die of poison as starvation," Forepaugh countered.

Without more ado the Martian descended, cut out some large, juicy chunks as his fancy dictated, and brought his loot back up the tree. The meat was delicious and apparently wholesome. They gorged themselves and threw away what they could not eat,

for food spoils very quickly in the Inranian jungles and uneaten meat would only serve to attract hordes of the gauzy-winged, glutinous Inranian swamp flies. As they sank into slumber they could hear the beginning of a bedlam of snarling and fighting as the lesser Carnivora fed on the body of the fallen giant.

When they awoke the chronometer recorded the passing of twelve hours, and they had to tear a network of strong fibers with which the tree had invested them preparatory to absorbing their bodies as food. For so keen is the competition for life on Inra that practically all vegetation is capable of absorbing animal food directly. Many an Inranian explorer can tell tales of narrow escapes from some of the more specialized flesh-eating plants; but they are now so well known that they are easily avoided.

A clean-picked framework of crushed and broken giant bones was all that was left of the late bellowing monster. Six-legged water dogs were polishing them hopefully, or delving into them with their long, sinuous snouts for the marrow. The Earth man fired a few shots with his six-shooter, and they scattered,

dragging the bodies of their fallen companions to a safe distance to be eaten.

Only one of the flash pistols was in working order. The other had been trampled by heavy hoofs and was useless. A heavy handicap under which to traverse fifty miles of abysmal jungle. They started with nothing for breakfast except water, of which they had plenty.

Fortunately the outcroppings of rocks and gravel washes were becoming more and more frequent, and they were able to travel at much better speed. As they left the low-lying jungle land they entered a zone which was faintly reminiscent of a terrestrial jungle. It was still hot, soggy, and fetid, but gradually the most primitive aspects of the scene were modified. The over-arching trees were less closely packed, and they came across occasional rock clearings which were bare of vegetation except for a dense carpet of brown, lichenlike vegetation that secreted an astonishing amount of juice. They slipped and sloshed through this, rousing swarms of odd, toothed birds, which darted angrily around their heads and slashed at

them with the razor-sharp saw edges on the back of their legs. Annoying as they were, they could be kept away with branches torn from trees, and their presence connoted an absence of the deadly jungle flesh-eaters, permitting a temporary relaxation of vigilance and saving the resources of the last flash gun.

They camped that "night" on the edge of one of these rock clearings. For the first time in weeks it had stopped raining, although the sun was still obscured. Dimly on the horizon could be seen the first of the foothills. Here they gathered some of the giant, oblong fungus that early explorers had taken for blocks of porous stone because of their size and weight, and, by dint of the plentiful application of fire pellets, managed to set it ablaze. The heat added nothing to their comfort, but it dried them out and allowed them to sleep unmolested.

An unwary winged eel served as their breakfast, and soon they were on their way to those beckoning hills. It had started to rain again, but the worst part of their journey was over. If they could reach the top of one of

the mountains there was a good chance that they would be seen and rescued by their relief ship, provided they did not starve first. The flyer would use the mountains as a base from which to search for the trading station, and it was conceivable that the skipper might actually have anticipated their desperate adventure and would look for them in the Mountains of Perdition.

They had crossed several ranges of the foothills and were beginning to congratulate themselves when the diffused light from above was suddenly blotted out. It was raining again, and above the echo-augmented thunder they heard a shrill screeching.

"A web serpent!" Gunga cried, throwing himself flat on the ground.

Forepaugh eased into a rock cleft at his side. Just in time. A great grotesque head bore down upon him, many-fanged as a medieval dragon. Between obsidian eyes was a fissure whence emanated a wailing and a foul odor. Hundreds of short, clawed legs slithered on the rocks under a long sinuous body. Then it seemed

to leap into the air again. Webs grew taut between the legs, strumming as they caught a strong uphill wind. Again it turned to the attack, and missed them. This time Forepaugh was ready for it. He shot at it with his flash pistol.

[ID: A black and white illustration

Nothing happened. The fog made accurate shooting impossible, and the gun lacked its former power. The web serpent continued to course back and forth over their heads.

"Guess we'd better run for it," Forepaugh murmured.

"Go 'head!"

They cautiously left their places of concealment. Instantly the serpent was down again, persistent if inaccurate. It struck the place of their first concealment and missed them.

"Run!"

They extended their weary muscles to the utmost, but it was soon apparent that they could not escape long. A rock wall in their path saved them.

"Hole!" the Martian gasped.

Forepaugh followed him into the rocky cleft. There was a strong draft of dry air, and it would have been next to impossible to hold the Martian back, so Forepaugh allowed him to lead on toward the source of the draft. As long as it led into the mountains he didn't care.

The natural passageway was untenanted. Evidently its coolness and dryness made it untenable for most of

Inra's humidity and heat loving life. Yet the floor was so smooth that it must have been artificially leveled. Faint illumination was provided by the rocks themselves. They appeared to be covered by some microscopic phosphorescent vegetation.

After hundreds of twists and turns and interminable straight galleries the cleft turned more sharply upward, and they had a period of stiff climbing. They must have gone several miles and climbed at least 20,000 feet. The air became noticeably thin, which only exhilarated Gunga, but slowed the Earth man down. But at last they came to the end of the cleft. They could go no further, but above them, at least 500 feet higher, they saw a round patch of sky, miraculously bright blue sky!

"A pipe!" Forepaugh cried.

He had often heard of these mysterious, almost fabulous structures sometimes reported by passing travelers. Straight and true, smooth as glass and apparently immune to the elements, they had been occasionally seen standing on the very tops of the

highest mountains—seen for a few moments only before they were hidden again by the clouds. Were they observatories of some ancient race, placed thus to pierce the mysteries of outer space? They would find out.

The inside of the pipe had zigzagging rings of metal, conveniently spaced for easy climbing. With Gunga leading, they soon reached the top. But not quite.

"Eh?" said Forepaugh.

"Uh?" said Gunga.

There had not been a sound, but a distinct, definite command had registered on their minds.

"Stop!"

They tried to climb higher, but could not unclasp their hands. They tried to descend, but could not lower their feet.

The light was by now relatively bright, and as by

command their eyes sought the opposite wall. What they saw gave their jaded nerves an unpleasant thrill—a mass of doughy matter of a blue-green color about three feet in diameter, with something that resembled a cyst filled with transparent liquid near its center.

And this thing began to flow along the rods, much as tar flows. From the mass extended a pseudopod; touched Gunga on the arm. Instantly the arm was raw and bleeding. Terrified, immovable, he writhed in agony. The pseudopod returned to the main mass, disappearing into its interior with the strip of bloody skin.

Its attention was centered so much on the luckless Martian that its control slipped from Forepaugh. Seizing his flash pistol, he set the localized for a small area and aimed it at the thing, intent on burning it into nothingness. But again his hand was stayed. Against the utmost of his will-power his fingers opened, letting the pistol drop. The liquid in the cyst danced and bubbled. Was it laughing at him? It had read his mind—thwarted his will again.

Again a pseudopod stretched out and a strip of raw, red flesh adhered to it and was consumed. Mad rage convulsed the Earth man. Should he throw himself tooth and nail on the monster? And be engulfed?

He thought of the six-shooter. It thrilled him.

But wouldn't it make him drop that too?

A flash of atavistic cunning came to him.

He began to reiterate in his mind a certain thought.

"This thing is so I can see you better—this thing is so I can see you better."

He said it over and over, with all the passion and devotion of a celibate's prayer over a uranium fountain.

"This thing is harmless—but it will make me see you better!"

Slowly he drew the six-shooter. In some occult way he

knew it was watching him.

"Oh, this is harmless! This is an instrument to aid my weak eyes! It will help me realize your mastery! This will enable me to know your true greatness. This will enable me to know you as a god."

Was it complacency or suspicion that stirred the liquid in the cyst so smoothly? Was it susceptible to flattery? He sighted along the barrel.

"In another moment your great intelligence will overwhelm me," proclaimed his surface mind desperately, while the subconscious tensed the trigger. And at that the clear liquid burst into a turmoil of alarm. Too late. Forepaugh went limp, but not before he had loosed a steel-jacketed bullet that shattered the mind cyst of the pipe denizen. A horrible pain coursed through his every fibre and nerve. He was safe in the arms of Gunga, being carried to the top of the pipe to the clean dry air, and the blessed, blistering sun.

The pipe denizen was dying. A viscous, inert mass, it

dropped lower and lower, lost contact at last, shattered into slime at the bottom.

Miraculous sun! For a luxurious fifteen minutes they roasted there on the top of the pipe, the only solid thing in a sea of clouds as far as the eye could reach. But no! That was a circular spot against the brilliant white of the clouds, and it was rapidly coming closer. In a few minutes it resolved itself into the *Comet*, fast relief ship of the Terrestrial, Inranian, Genidian, and Zydian Lines, Inc. With a low buzz of her repulsion motors she drew alongside. Hooks were attached and ports opened. A petty officer and a crew of roustabouts made her fast.

"What the hell's going on here?" asked the cocky little terrestrial who was skipper, stepping out and surveying the castaways. "We've been looking for you ever since your directional wave failed. But come on in—come on in!"

He led the way to his stateroom, while the ship's surgeon took Gunga in charge. Closing the door carefully, he delved into the bottom of his locker and

brought out a flask.

"Can't be too careful," he remarked, filling a small tumbler for himself and another for his guest. "Always apt to be some snooper to report me. But say—you're wanted in the radio room."

"Radio room nothing! When do we eat?"

"Right away, but you'd better see him. Fellow from the Interplanetary News Agency wants you to broadcast a copyrighted story. Good for about three years' salary, old boy."

"All right. I'll see him"—with a happy sigh—"just as soon as I put through a personal message."

#42 The Lord Of Space, By Victor Rousseau Emanuel:

A black Caesar had arisen on Eros—and all Earth trembled at his distant menace.

[IDHERE]

A Black Caesar had arisen on Eros—and all Earth trembled at his distant menace.

“On the day of the next full moon every living thing on earth will be wiped out of existence—unless you succeed in your mission, Lee.”

Nathaniel Lee looked into the face of Silas Stark, President of the United States of the World, and nodded grimly. "I'll do my best, Sir," he answered.

"You have the facts. We know who this self-styled Black Caesar is, who has declared war upon humanity. He is a Dane named Axelson, whose father, condemned to life imprisonment for resisting the new world-order, succeeded in obtaining possession of an interplanetary liner.

"He filled it with the gang of desperate men who had been associated with him in his successful escape from the penitentiary. Together they sailed into Space. They disappeared. It was supposed that they had somehow met their death in the ether, beyond the

range of human ken.

"Thirty years passed, and then this son of Axelson, born, according to his own story, of a woman whom the father had persuaded to accompany him into Space, began to radio us. We thought at first it was some practical joker who was cutting in.

It was like struggling with some vampire creatures in a hideous dream.

"When our electricians demonstrated beyond doubt that the voice came from outer space, it was supposed that some one in our Moon Colony had acquired a transmitting machine. Then the ships we sent to the Moon Colony for gold failed to return. As you know, for seven weeks there has been no communication with the Moon. And at the last full moon the—blow—fell.

"The world depends upon you, Lee. The invisible rays that destroyed every living thing from China to Australia—one-fifth of the human race—will fall upon the eastern seaboard of America when the moon is

full again. That has been the gist of Axelson's repeated communications.

"We shall look to you to return, either with the arch-enemy of the human race as your prisoner, or with the good news that mankind has been set free from the menace that overhangs it.

"God bless you, my boy!" The President of the United States of the World gripped Nat's hand and stepped down the ladder that led from the landing-stage of the great interplanetary space-ship.

The immense landing-field reserved for the ships of the Interplanetary Line was situated a thousand feet above the heart of New York City, in Westchester County. It was a flat space set on the top of five great towers, strewn with electrified sand, whose glow had the property of dispersing the sea fogs. There, at rest upon what resembled nothing so much as iron claws, the long gray shape of the vacuum flyer bulked.

Nat sneezed as he watched the operations of his men, for the common cold, or coryza, seemed likely to be

the last of the germ diseases that would yield to medical science, and he had caught a bad one in the Capitol, while listening to the debate in the Senate upon the threat to humanity. And it was cold on the landing-stage, in contrast to the perpetual summer of the glass-roofed city below.

But Nat forgot the cold as he watched the preparations for the ship's departure. Neon and nitrogen gas were being pumped under pressure into the outer shell, where a minute charge of leucon, the newly discovered element that helped to counteract gravitation, combined with them to provide the power that would lift the vessel above the regions of the stratosphere.

In the low roof-buildings that surrounded the stage was a scene of tremendous activity. The selenium discs were flashing signals, and the radio receivers were shouting the late news; on the great power boards dials and light signals stood out in the glow of the amylite tubes. On a rotary stage a thousand feet above the ship a giant searchlight, visible for a thousand miles, moved its shaft of dazzling luminosity

across the heavens.

Now the spar-aluminite outer skin of the ship grew bright with the red neon glare. Another ship, from China, dropped slowly to its stage near by, and the unloaders swarmed about the pneumatic tubes to receive the mail. The teleradio was shouting news of a failure of the Manchurian wheat crop. Nat's chief officer, a short cockney named Brent, came up to him.

"Ready to start, Sir," he said.

Nat turned to him. "Your orders are clear?"

"Yes, Sir."

"Send Benson here."

"I'm here, Sir." Benson, the ray-gunner in charge of the battery that comprised the vessel's armament, a lean Yankee from Connecticut, stepped forward.

"You know your orders, Benson? Axelson has seized the Moon and the gold-mines there. He's planning to

obliterate the Earth. We've got to go in like mad dogs and shoot to kill. No matter if we kill every living thing there, even our own people who are inmates of the Moon's penal settlement, we've got to account for Axelson."

"Yes, Sir."

"We can't guess how he got those gold-ships that returned with neon and argon for the Moon colonists. But he mustn't get us. Let the men understand that. That's all."

"Very good, Sir."

The teleradio suddenly began to splutter: A-A-A, it called. And instantly every sound ceased about the landing-stage. For that was the call of Axelson, somewhere upon the Moon.

"Axelson speaking. At the next full moon all the American Province of the World Federation will be annihilated, as the Chinese Province was at the last. There's no hope for you, good people. Send out your

vacuum liners. I can use a few more of them. Within six months your world will be depopulated, unless you flash me the signal of surrender."

Would the proud old Earth have to come to that? Daily those ominous threats had been repeated, until popular fears had become frenzy. And Nat was being sent out as a last hope. If he failed, there would be nothing but surrender to this man, armed with a super-force that enabled him to lay waste the Earth from the Moon.

Within one hour, those invisible, death-dealing rays had destroyed everything that inhaled oxygen and exhaled carbon. The ray with which the liner was equipped was a mere toy in comparison. It would kill at no more than 500 miles, and its action was quite different.

As a prelude to Earth's surrender, Axelson demanded that World President Stark and a score of other dignitaries should depart for the Moon as hostages. Every ray fortress in the world was to be dismantled, every treasury was to send its gold to be piled up in a

great pyramid on the New York landing-stage. The Earth was to acknowledge Axelson as its supreme master.

The iron claws were turning with a screwlike motion, extending themselves, and slowly raising the interplanetary vessel until she looked like a great metal fish with metal legs ending with suckerlike disks. But already she was floating free as the softly purring engines held her in equipoise. Nat climbed the short ladder that led to her deck. Brent came up to him again.

"That teleradio message from Axelson—" he began.

"Yes?" Nat snapped out.

"I don't believe it came from the Moon at all."

"You don't? You think it's somebody playing a hoax on Earth? You think that wiping out of China was just an Earth-joke?"

"No, Sir." Brent stood steady under his superior's

sarcasm. "But I was chief teleradio operator at Greenwich before being promoted to the Province of America. And what they don't know at Greenwich they don't know anywhere."

Brent spoke with that self-assurance of the born cockney that even the centuries had failed to remove, though they had removed the cockney accent.

"Well, Brent?"

"I was with the chief electrician in the receiving station when Axelson was radioing last week. And I noticed that the waves of sound were under a slight Doppler effect. With the immense magnification necessary for transmitting from the Moon, such deflection might be construed as a mere fan-like extension. But there was ten times the magnification one would expect from the Moon; and I calculated that those sound-waves were shifted somewhere."

"Then what's your theory, Brent?"

"Those sounds come from another planet. Somewhere

on the Moon there's an intercepting and re-transmitting plant. Axelson is deflecting his rays to give the impression that he's on the Moon, and to lure our ships there."

"What do you advise?" asked Nat.

"I don't know, Sir."

"Neither do I. Set your course Moonward, and tell Mr. Benson to keep his eyes peeled."

The Moon Colony, discovered in 1976, when Kramer, of Baltimore, first proved the practicability of mixing neon with the inert new gas, leucon, and so conquering gravitation, had proved to be just what it had been suspected of being—a desiccated, airless desolation. Nevertheless, within the depths of the craters a certain amount of the Moon's ancient atmosphere still lingered, sufficient to sustain life for the queer troglodytes, with enormous lung-boxes, who survived there, browsing like beasts upon the stunted, aloe-like vegetation.

Half man, half ape, and very much unlike either, these vestiges of a species on a ruined globe had proved tractable and amenable to discipline. They had become the laborers of the convict settlement that had sprung up on the Moon.

Thither all those who had opposed the establishment of the World Federation, together with all persons convicted for the fourth time of a felony, had been transported, to superintend the efforts of these dumb, unhuman Moon dwellers. For it had been discovered that the Moon craters were extraordinarily rich in gold, and gold was still the medium of exchange on Earth.

To supplement the vestigial atmosphere, huge stations had been set up, which extracted the oxygen from the subterranean waters five miles below the Moon's crust, and recombined it with the nitrogen with which the surface layer was impregnated, thus creating an atmosphere which was pumped to the workers.

Then a curious discovery had been made. It was

impossible for human beings to exist without the addition of those elements existing in the air in minute quantities—neon, krypton, and argon. And the ships that brought the gold bars back from the Moon had conveyed these gaseous elements there.

The droning of the sixteen atomic motors grew louder, and mingled with the hum of gyroscopes. The ladder was drawn up and the port hole sealed. On the enclosed bridge Nat threw the switch of durobronze that released the non-conducting shutter which gave play to the sixteen great magnets. Swiftly the great ship shot forward into the air. The droning of the motors became a shrill whine, and then, growing too shrill for human ears to follow it, gave place to silence.

Nat set the speed lever to five hundred miles an hour, the utmost that had been found possible in passing through the earth's atmosphere, owing to the resistance, which tended to heat the vessel and damage the delicate atomic engines. As soon as the ether was reached, the speed would be increased to ten or twelve thousand. That meant a twenty-two

hour run to the Moon Colony—about the time usually taken.

He pressed a lever, which set bells ringing in all parts of the ship. By means of a complicated mechanism, the air was exhausted from each compartment in turn, and then replaced, and as the bells rang, the men at work trooped out of these compartments consecutively. This had been originated for the purpose of destroying any life dangerous to man that might unwittingly have been imported from the Moon, but on one occasion it had resulted in the discovery of a stowaway.

Then Nat descended the bridge to the upper deck. Here, on a platform, were the two batteries of three ray-guns apiece, mounted on swivels, and firing in any direction on the port and starboard sides respectively. The guns were enclosed in a thin sheath of osmium, through which the lethal rays penetrated unchanged; about them, thick shields of lead protected the gunners.

He talked with Benson for a while. "Don't let Axelson

get the jump on you," he said. "Be on the alert every moment." The gunners, keen-looking men, graduates from the Annapolis gunnery school, grinned and nodded. They were proud of their trade and its traditions; Nat felt that the vessel was safe in their hands.

The chief mate appeared at the head of the companion, accompanied by a girl. "Stowaway, Sir," he reported laconically. "She tumbled out of the repair shop annex when we let out the air!"

Nat stared at her in consternation, and the girl stared back at him. She was a very pretty girl, hardly more than twenty-two or three, attired in a businesslike costume consisting of a leather jacket, knickers, and the black spiral puttees that had come into style in the past decade. She came forward unabashed.

"Well, who are you?" snapped Nat.

"Madge Dawes, of the Universal News Syndicate," she answered, laughing.

"The devil!" muttered Nat. "You people think you run the World Federation since you got President Stark elected."

"We certainly do," replied the girl, still laughing.

"Well, you don't run this ship," said Nat. "How would you like a long parachute drop back to Earth?"

"Don't be foolish, my dear man," said Madge. "Don't you know you'll get wrinkles if you scowl like that? Smile! Ah, that's better. Now, honestly, Cap we just had to get the jump on everybody else in interviewing Axelson. It means such a lot to me."

Pouts succeeded smiles. "You're not going to be cross about it, are you?" she pleaded.

"Do you realize the risk you're running, young woman?" Nat demanded. "Are you aware that our chances of ever getting back to Earth are smaller than you ought to have dreamed of taking?"

"Oh, that's all right," the girl responded. "And now

that we're friends again, would you mind asking the steward to get me something to eat? I've been cooped up in that room downstairs for fifteen hours, and I'm simply starving."

Nat shrugged his shoulders hopelessly. He turned to the chief mate. "Take Miss Dawes down to the saloon and see that Wang Ling supplies her with a good meal," he ordered. "And put her in the Admiral's cabin. That good enough for you?" he asked satirically.

"Oh that'll be fine," answered the girl enthusiastically. "And I shall rely on you to keep me posted about everything that's going on. And a little later I'm going to take X-ray photographs of you and all these men." She smiled at the grinning gunners. "That's the new fad, you know, and we're going to offer prizes for the best developed skeletons in the American Province, and pick a King and Queen of Beauty!"

"A radio, Sir!"

Nat, who had snatched a brief interval of sleep,

started up as the man on duty handed him the message. The vessel had been constantly in communication with Earth during her voyage, now nearing completion, but the dreaded A-A-A that prefaced this message told Nat that it came from Axelson.

"Congratulations on your attempt," the message ran, "I have watched your career with the greatest interest, Lee, through the medium of such scraps of information as I have been able to pick up on the Moon. When you are my guest to-morrow I shall hope to be able to offer you a high post in the new World Government that I am planning to establish. I need good men. Fraternally, the Black Caesar."

Nat whirled about. Madge Dawes was standing behind him, trying to read the message over his shoulder.

"Spying, eh?" said Nat bitterly.

"My dear man, isn't that my business?"

"Well, read this, then," said Nat, handing her the message. "You're likely to repent this crazy trick of yours before we get much farther."

And he pointed to the cosmic-ray skiagraph of the Moon on the curved glass dome overhead. They were approaching the satellite rapidly. It filled the whole dome, the craters great black hollows, the mountains standing out clearly. Beneath the dome were the radium apparatus that emitted the rays by which the satellite was photographed cinematographically, and the gyroscope steering apparatus by which the ship's course was directed.

Suddenly a buzzer sounded a warning. Nat sprang to the tube.

"Gravitational interference X40, gyroscopic aberrancy one minute 29," he called. "Discharge static electricity from hull. Mr. Benson, stand by."

"What does that mean?" asked Madge.

"It means I shall be obliged if you'll abstain from

speaking to the man at the controls," snapped Nat.

"And what's that?" cried Madge in a shriller voice, pointing upward.

Across the patterned surface of the Moon, shown on the skiagraph, a black, cigar-shaped form was passing. It looked like one of the old-fashioned dirigibles, and the speed with which it moved was evident from the fact that it was perceptibly traversing the Moon's surface. Perhaps it was travelling at the rate of fifty thousand miles an hour.

Brent, the chief officer, burst up the companion. His face was livid.

"Black ship approaching us from the Moon, Sir," he stammered. "Benson's training his guns, but it must be twenty thousands miles away."

"Yes, even our ray-guns won't shoot that distance," answered Nat. "Tell Benson to keep his guns trained as well as he can, and open fire at five hundred."

Brent disappeared. Madge and Nat were alone on the bridge. Nat was shouting incomprehensible orders down the tube. He stopped and looked up. The shadow of the approaching ship had crossed the Moon's disk and disappeared.

"Well, young lady, I think your goose is cooked," said Nat. "If I'm not mistaken, that ship is Axelson's, and he's on his way to knock us galley-west. And now oblige me by leaving the bridge."

"I think he's a perfectly delightful character, to judge from that message he sent you," answered Madge, "and—"

Brent appeared again. "Triangulation shows ten thousand miles, Sir," he informed Nat.

"Take control," said Nat. "Keep on the gyroscopic course, allowing for aberrancy, and make for the Crater of Pytho. I'll take command of the guns." He hurried down the companion, with Madge at his heels.

The gunners stood by the ray-guns, three at each. Benson perched on a revolving stool above the batteries. He was watching a periscopic instrument that connected with the bridge dome by means of a tube, a flat mirror in front of him showing all points of the compass. At one edge the shadow of the black ship was creeping slowly forward.

"Eight thousand miles, Sir," he told Nat. "One thousand is our extreme range. And it looks as if she's making for our blind spot overhead."

Nat stepped to the speaking-tube. "Try to ram her," he called up to Brent. "We'll open with all guns, pointing forward."

"Very good, Sir," the Cockney called back.

The black shadow was now nearly in the centre of the mirror. It moved upward, vanished. Suddenly the atomic motors began wheezing again. The wheeze became a whine, a drone.

"We've dropped to two thousand miles an hour, Sir,"

called Brent.

Nat leaped for the companion. As he reached the top he could hear the teleradio apparatus in the wireless room overhead begin to chatter:

"A-A-A. Don't try to interfere. Am taking you to the Crater of Pytho. Shall renew my offer there. Any resistance will be fatal. Axelson."

And suddenly the droning of the motors became a whine again, then silence. Nat stared at the instrument-board and uttered a cry.

"What's the matter?" demanded Madge.

Nat swung upon her. "The matter?" he bawled. "He's neutralized our engines by some infernal means of his own, and he's towing us to the Moon!"

The huge sphere of the Moon had long since covered the entire dome. The huge Crater of Pytho now filled it, a black hollow fifty miles across, into which they were gradually settling. And, as they settled, the pale

Earth light, white as that of the Moon on Earth, showed the gaunt masses of bare rock, on which nothing grew, and the long stalactites of glassy lava that hung from them.

Then out of the depths beneath emerged the shadowy shape of the landing-stage.

"You are about to land," chattered the radio. "Don't try any tricks; they will be useless. Above all, don't try to use your puny ray. You are helpless."

The ship was almost stationary. Little figures could be seen swarming upon the landing-stage, ready to adjust the iron claws to clamp the hull. With a gesture of helplessness, Nat left the bridge and went down to the main deck where, in obedience to his orders, the crew had all assembled.

"Men, I'm putting it up to you," he said. "Axelson, the Black Caesar, advises us not to attempt to use the Ray-guns. I won't order you to. I'll leave the decision with you."

"We tried it fifteen minutes ago, Sir," answered Benson. "I told Larrigan to fire off the stern starboard gun to see if it was in working order, and it wasn't!"

At that moment the vessel settled with a slight jar into the clamps. Once more the teleradio began to scream:

"Open the port hold and file out slowly. Resistance is useless. I should turn my ray upon you and obliterate you immediately. Assemble on the landing-stage and wait for me!"

"You'd best obey," Nat told his men. "We've got a passenger to consider." He glared at Madge as he spoke, and Madge's smile was a little more tremulous than it had been before.

"This is the most thrilling experience of my life, Captain Lee," she said. "And I'll never rest until I've got an X-Ray photograph of Mr. Axelson's skeleton for the Universal News Syndicate."

One by one, Nat last, the crew filed down the ladder onto the landing-stage, gasping and choking in the

rarefied air that lay like a blanket at the bottom of the crater. And the reason for this was only too apparent to Nat as soon as he was on the level stage.

Overhead, at an altitude of about a mile, the black ship hung, and from its bow a stupendous searchlight played to and fro over the bottom of the crater, making it as light as day. And where had been the mining machinery, the great buildings that had housed convicts and Moon people, and the huge edifice that contained the pumping station, there was—nothing.

The devilish ray of Axelson had not merely destroyed them, it had obliterated all traces of them, and the crew of the liner were breathing the remnants of the atmosphere that still lay at the bottom of the Crater of Pytho.

But beside the twin landing-stages, constructed by the World Federation, another building arose, with an open front. And that front was a huge mirror, now scintillating under the searchlight from the black ship.

"That's it, Sir!" shouted Brent.

"That's what?" snapped Nat.

"The deflecting mirror I was speaking of. That's what deflected the ray that wiped out China. The ray didn't come from the Moon. And that's the mirror that deflects the teleradio waves, the super-Hertzian rays that carry the sound."

Nat did not answer. Sick at heart at the failure of his mission, he was watching the swarm of Moon men who were at work upon the landing-stage, turning the steel clamps and regulating the mechanism that controlled the apparatus. Dwarfed, apish creature, with tiny limbs, and chests that stood out like barrels, they bustled about, chattering in shrill voices that seemed like the piping of birds.

It was evident that Axelson, though he had wiped out the Moon convicts and the Moon people in the crater, had reserved a number of the latter for personal use.

The black ship was dropping into its position at the

second landing-stage, connected with the first by a short bridge. The starboard hold swung open, and a file of shrouded and hooded forms appeared, masked men, breathing in condensed air from receptacles upon their chests, and staring with goggle eyes at their captives. Each one held in his hand a lethal tube containing the ray, and, as if by command, they took up their stations about their prisoners.

Then, at a signal from their leader, they suddenly doffed their masks.

Nat looked at them in astonishment. He had not known whether these would be Earth denizens or inhabitants of some other planet. But they were Earth men. And they were old.

Men of sixty or seventy, years, with long, gray beards and wrinkled faces, and eyes that stared out from beneath penthouses of shaggy eyebrows. Faces on which were imprinted despair and hopelessness.

Then the first man took off his mask and Nat saw a man of different character.

A man in the prime of life, with a mass of jet black hair and a black beard that swept to his waist, a nose like a hawk's, and a pair of dark blue eyes that fixed themselves on Nat's with a look of Luciferian pride.

"Welcome, Nathaniel Lee," said the man, in deep tones that had a curious accent which Nat could not place. "I ought to know your name, since your teleradios on Earth have been shouting it for three days past as that of the man who is to save Earth from the threat of destruction. And you know me!"

"Axelson—the Black Caesar," Nat muttered. For the moment he was taken aback. He had anticipated any sort of person except this man, who stood, looked, and spoke like a Viking, this incarnation of pride and strength.

Axelson smiled—and then his eyes lit upon Madge Dawes. And for a moment he stood as if petrified into a block of massive granite.

"What—who is this?" he growled.

"Why, I'm Madge Dawes, of the Universal News Syndicate," answered the girl, smiling at Axelson in her irrepressible manner. "And I'm sure you're not nearly such a bold, bad pirate as people think, and you're going to let us all go free."

Instantly Axelson seemed to become transformed into a maniac. He turned to the old men and shouted in some incomprehensible language. Nat and Madge, Brent and Benson, and two others who wore the uniforms of officers were seized and dragged across the bridge to the landing-stage where the black ship was moored. The rest of the crew were ordered into a double line.

And then the slaughter began.

Before Nat could even struggle to break away from the gibbering Moon men to whom he and the other prisoners had been consigned, the aged crew of the Black Caesar had begun their work of almost instantaneous destruction.

Streams of red and purple light shot from the ray-pistols that they carried, and before them the crew of the ether-liner simply withered up and vanished. They became mere masses of human débris piled on the landing-stage, and upon these masses, too, the old men turned their implements, until only a few heaps of charred carbon remained on the landing-stage, impalpable as burned paper, and slowly rising in the low atmospheric pressure until they drifted over the crater.

Nat had cried out in horror at the sight, and tried to tear himself free from the grasp of the Moon dwarfs who held him. So had the rest. Never was struggle so futile. Despite their short arms and legs, the Moon dwarfs held them in an unshakable grip, chattering and squealing as they compressed them against their barrel-like chests until the breath was all but crushed out of their bodies.

"Devil!" cried Nat furiously, as Axelson came up to him. "Why don't you kill us, too?" And he hurled furious taunts and abuse at him, in the hope of goading him into making the same comparatively

merciless end of his prisoners.

Axelson looked at him calmly, but made no reply. He looked at Madge again, and his features were convulsed with some emotion that gave him the aspect of a fiend. And then only did Nat realize that it was Madge who was responsible for the Black Caesar's madness.

Axelson spoke again, and the prisoners were hustled up the ladder and on board the black vessel.

"The Kommandant-Kommissar will see you!" The door of their prison had opened, letting in a shaft of light, and disclosing one of the graybeards, who stood there, pointing at Nat.

"The—who?" Nat demanded.

"The Kommandant-Kommissar, Comrade Axelson," snarled the graybeard.

Nat knew what that strange jargon meant. He had read books about the political sect known as

Socialists who flourished in the Nineteenth and Twentieth Centuries, and, indeed, were even yet not everywhere extinct. And with that a flash of intuition explained the presence of these old men on board.

These were the men who had been imprisoned in their youth, with Axelson's father, and had escaped and made their way into space, and had been supposed dead long since. Somewhere they must have survived.

And here they were, speaking a jargon of past generations, and ignorant that the world had changed, relics of the past, dead as the dead Moon from which the black ship was winging away through the ether.

"Don't go, Captain," pleaded Madge. "Tell him we'll all go together."

Nat shook his head. "Maybe I'll be able to make terms with him," he answered, and stepped out upon the vessel's deck.

The graybeard slammed the door and laughed savagely. "You'll make no terms with the Black Caesar," he said. "This is the reign of the proletariat. The bourgeois must die! So Lenin decreed!"

But he stopped suddenly and passed his hand over his forehead like a man awakening from a dream.

"Surely the proletariat has already triumphed on earth?" he asked. "A long time has passed, and daily we expect the summons to return and establish the new world-order. What year is this? Is it not 2017? It is so hard to reckon on Eros."

"On Eros?" thought Nat. "This is the year 2044," he answered. "You've been dreaming, my friend. We've had our new world-order, and it's not in the least like the one you and your friends anticipated."

"Gott!" screamed the old man. "Gott, you're lying to me, bourgeois! You're lying, I tell you!"

So Eros was their destination! Eros, one of the asteroids, those tiny fragments of a broken planet, lying outside the orbit of Mars. Some of these little worlds, of which more than a thousand are known to exist, are no larger than a gentleman's country estate; some are mere rocks in space. Eros, Nat knew, was distinguished among them from the fact that it had an eccentric orbit, which brought it at times nearer Earth than any other heavenly body except the Moon.

Also that it had only been known for thirty years, and that it was supposed to be a double planet, having a dark companion.

That was in Nat's mind as he ascended the bridge to where Axelson was standing at the controls, with one of the graybeards beside him. The door of his stateroom was open, and suddenly there scuttled out of it one of the most bestial objects Nat had ever seen.

It was a Moon woman, a dwarfish figure, clothed in a shapeless garment of spun cellulose, and in her arms she held a heavy-headed Moon baby, whose huge

chest stood up like a pyramid, while the tiny arms and legs hung dangling down.

"Here is the bourgeois, Kommandant," said Nat's captor.

Axelson looked at Nat, eye meeting eye in a slow stare. Then he relinquished the controls to the graybeard beside him, and motioned Nat to precede him into the stateroom.

Nat entered. It was an ordinary room, much like that of the captain of the ether-liner now stranded on the Moon. There were a bunk, chairs, a desk and a radio receiver.

Axelson shut the door. He tried to speak and failed to master his emotion. At last he said:

"I am prepared to offer you terms, Nathaniel Lee, in accordance with my promise."

"I'll make no terms with murderers," replied Nat bitterly.

Axelson stood looking at him. His great chest rose and fell. Suddenly he put out one great hand and clapped Nat on the shoulder.

"Wise men," he said, "recognize facts. Within three weeks I shall be the undisputed ruler of Earth. Whether of a desert or of a cowed and submissive subject-population, rests with the Earth men. I have never been on Earth, for I was born on Eros. My mother died at my birth. I have never seen another human woman until to-day."

Nat looked at him, trying to follow what was in Axelson's mind.

"My father fled to Eros, a little planet seventeen miles in diameter, as we have found. He called it a heavenly paradise. It was his intention to found there a colony of those who were in rebellion against the tyrants of Earth.

"His followers journeyed to the Moon and brought back Moon women for wives. But there were no children of these unions. Later there were dissensions

and civil war. Three-fourths of the colony died in battle with one another.

"I was a young man. I seized the reins of power. The survivors—these old men—were disillusioned and docile. I made myself absolute. I brought Moon men and women to Eros to serve us as slaves. But in a few years the last of my father's old compatriots will have died, and thus it was I conceived of conquering Earth and having men to obey me. For fifteen years I have been experimenting and constructing apparatus, with which I now have Earth at my mercy.

"But I shall need assistance, intelligent men who will obey me and aid me in my plans. That is why I saved you and the other officers of your ether-lines. If you will join me, you shall have the highest post on Earth under me, Nathaniel Lee, and those others shall be under you."

Axelson paused, and, loathing the man though he did, Nat was conscious of a feeling of pity for him that he could not control. He saw his lonely life on Eros, surrounded by those phantom humans of the past,

and he understood his longing for Earth rule—he the planetary exile, the sole human being of all the planetary system outside Earth, perhaps, except for his dwindling company of aged men.

"To-day, Nathaniel Lee," Axelson went on, "my life was recast in a new mould when I saw the woman you have brought with you. I did not know before that women were beautiful to look on. I did not dream that creatures such as she existed. She must be mine, Nathaniel Lee.

"But that is immaterial. What is your answer to my offer?"

Nat was trying to think, though passion distorted the mental images as they arose in his brain. To Axelson it was evidently incomprehensible that there would be any objection to his taking Madge. Nat saw that he must temporize for Madge's sake.

"I'll have to consult my companions," he answered.

"Of course," answered Axelson. "That is reasonable.

Tell them that unless they agree to join me it will be necessary for them to die. Do Earth men mind death? We hate it on Eros, and the Moon men hate it, too, though they have a queer legend that something in the shape of an invisible man raises from their ashes. My father told me that that superstition existed on Earth in his time, too. Go and talk to your companions, Nathaniel Lee."

The Black Caesar's voice was almost friendly. He clapped Nat on the shoulder again, and called the graybeard to conduct him back to his prison.

"Oh, Captain Lee, I'm so glad you're back!" exclaimed Madge. "We've been afraid for you. Is he such a terrible man, this Black Caesar?"

Nat sneered, then grinned malevolently. "Well, he's not exactly the old-fashioned idea of a Sunday-school teacher," he answered. Of course he could not tell the girl about Axelson's proposal.

The little group of prisoners stood on the upper deck of the black ship and watched the Moon men

scurrying about the landing-stage as she hovered to her position.

Axelson's father had not erred when he had called the tiny planet, Eros, a heavenly paradise, for no other term could have described it.

They were in an atmosphere so similar to that of Earth that they could breathe with complete freedom, but there seemed to be a lightness and a vigor in their limbs that indicated that the air was supercharged with oxygen or ozone. The presence of this in large amounts was indicated by the intense blueness of the sky, across which fleecy clouds were drifting.

And in that sky what looked like threescore moons were circling with extraordinary swiftness. From thirty to forty full moons, of all sizes, from that of a sun to that of a brilliant planet, and riding black against the blue.

The sun, hardly smaller than when seen from Earth, shone in the zenith, and Earth and Mars hung in the east and north respectively, each like a blood-red sun.

The moons were some of the thousand other asteroids, weaving their lacy patterns in and out among each other. But, stupendous as the sight was, it was toward the terrestrial scene that the party turned their eyes as the black ship settled.

A sea of sapphire blue lapped sands of silver and broke into soft lines of foam. To the water's edge extended a lawn of brightest green, and behind this an arm of the sea extended into what looked like a tropical forest. Most of the trees were palmlike, but towered to immense heights, their foliage swaying in a gentle breeze. There were apparently no elevations, and yet, so small was the little sphere that the ascending curve gave the illusion of distant heights, while the horizon, instead of seeming to rise, lay apparently perfectly flat, producing an extraordinary feeling of insecurity.

Near the water's edge a palatial mansion, built of hewn logs and of a single story, stood in a garden of brilliant flowers. Nearer, beyond the high landing-stage, were the great shipbuilding works, and near them an immense and slightly concave mirror flashed

back the light of the sun.

"The death ray!" whispered Brent to Nat.

Axelson came up to the party as the ship settled down. "Welcome to Eros," he said cordially. "My father told me that in some Earth tongue that name meant 'love'."

Never, perhaps, was so strange a feast held as that with which Axelson entertained his guests that day. Dwarfish Moon men passed viands and a sort of palm wine in the great banquet-room, which singularly resembled one of those early twentieth century interiors shown in museums. Only the presence of a dozen of the aged guards, armed with ray-rods, lent a grimness to the scene.

Madge sat on Axelson's right, and Nat on his left. The girl's lightheartedness had left her; her face grew strained as Axelson's motives—which Nat had not dared disclose to her—disclosed themselves in his manner.

Once, when he laid his finger for a moment against her white throat, she started, and for a moment it seemed as if the gathering storm must break.

For Nat had talked with his men, and all had agreed that they would not turn traitor, though they intended to temporize as long as possible, in the hope of catching the Black Caesar unawares.

Then slowly a somber twilight began to fall, and Axelson rose.

"Let us walk in the gardens during the reign of Erebos," he said.

"Erebos?" asked Nat.

"The black world that overshadows us each sleeping period," answered Axelson.

Nat knew what he meant. The dark companion of Eros revolves around it every six hours; the day of Eros would therefore never be longer than six hours, this without reckoning the revolution of Eros around

the sun. But owing to its small size, it was probable that it was bathed in almost perpetual sunshine.

The sweet scent of the flowers, much stronger than of any flowers on earth, filled the air. They walked across the green lawn and entered a jungle path, with bamboos and creeping plants on either side, and huge palmlike trees. Behind them stalked the guards with their ray-rods.

A lake of deepest black disclosed itself. Suddenly Madge uttered a scream and clung to Nat. "Look, look!" she cried. "It's horrible!"

Suddenly Nat realized that the lake swarmed with monsters. They were of crocodilian form, but twice the size of the largest crocodile, and sprawled over one another in the shallows beside the margin. As the party drew near, an enormous monster began waddling on its clawed feet toward them.

A mouth half the length of the creature opened, disclosing a purplish tongue and hideous fangs. Madge screamed again.

"Ah, so fear exists on Earth, too?" asked Axelson blandly. "That makes my conquest sure. I suspected it, and yet I was not sure that science had not conquered it. But there is no cause for fear. A magnetic field protects us. See!"

For the waddling monster suddenly stopped short as if brought up sharply by the bars of a cage, and drew back.

Axelson turned and wheezed in the Moon language—if the gibbering of the dwarfs could be called speech—and one of the guards answered him.

"These primitive dwellers on Eros I have preserved," said Axelson, "as a means of discipline. The Moon animals are afraid of them. I keep a supply of those who have transgressed my laws to feed them. See!"

He turned and pointed. Two guards were bringing a gibbering, screeching, struggling Moon man with them. Despite his strength, he seemed incapable of making any resistance, but his whole body quivered, and his hideous face was contorted with agony of

terror.

At a distance of some fifty feet they turned aside into a little bypath through the jungle, reappearing close beside the Lake upon a raised platform. And what happened next happened so swiftly that Nat was unable to do anything to prevent it.

The guards disappeared; the Moon man, as if propelled by some invisible force, moved forward jerkily to the lake's edge. Instantly one of the saurians had seized him in its jaws, and another had wrenched half the body away, and the whole fighting, squirming mass vanished in the depths.

And from far away came the screeching chant of the Moon men, as if in invocation to some hideous deity.

And, moving perceptibly, the huge black orb of Eros's dark satellite crept over the sky, completely covering it.

Axelson stepped forward to where Nat stood, supporting Madge in his arms. The girl had fainted

with horror at the scene.

"Your answer Nathaniel Lee," he said softly. "I know you have been postponing the decision. Now I will take the girl, and you shall give me your answer. Will you and these men join me, or will you die as the Moon man died?" He spoke wheezily, as if he, like Nat, had a cold.

And he put his arm around Madge.

Next moment something happened to him that had never happened in his life before. The Black Caesar went down under a well-directed blow to the jaw.

He leaped to his feet trembling with fury and barked a command. Instantly the old guards had hurled themselves forward. And behind them a horde of Moon men came, ambling.

While the guards covered their prisoners with their ray-rods, two Moon men seized each of them, imprisoning him in their unbreakable grasp.

Axelson pointed upward. "When the reign of Erebos is past," he said, "you become food for the denizens of the lake, unless you have agreed to serve me."

And he raised Madge in his arms, laughing as the girl fought and struggled to resist him.

"Madge!" cried Nat, trying to run toward her.

So furious were his struggles that for a moment he succeeded in throwing off the Moon men's grasp. Then he was caught again, and, fighting desperately, was borne off by the dwarfs through the shadows.

They traversed the border of the lake until a small stone building disclosed itself. Nat and the others were thrust inside into pitch darkness. The door clanged; in vain they hurled themselves against it. It was of wood, but it was as solid as the stone itself, and it did not give an inch for all their struggles.

"Where is your Kommandant?" The whisper seemed in the stone hut itself. "Your Nathaniel Lee. I must speak to him. I am the guard who brought him to the

Black Caesar on board the ship."

"I'm here," said Nat. "Where are you?"

"I am in the house of the ray. I am on guard there. I am speaking into the telephone which runs only to where you are. You can speak anywhere in the hut, and I shall hear you."

"Well, what do you want?" asked Nat.

"You love the Earth woman. I remember, when I was a boy, we used to love. I had forgotten. There was a girl in Stamford.... Tell me, is it true that this is the year 2044 and that the proletariat has not yet triumphed?"

"It's true," said Nat. "Those dreams are finished, We're proud of the World Federation. Tell me about Madge Dawes—the Earth woman. Is she safe?"

"He has taken her to his house. I do not think she is harmed. He is ill. He is closely guarded. There are rumors afoot. I do not know."

"What do you want, then?"

"If the Black Caesar dies will you take me back to Earth again? I long so for the old Earth life. I will be your slave, if only I can set foot on Earth before I die."

"Can you rescue us?" Nat held his breath.

"The Moon men are on guard."

"They have no ray-guns and you have."

"The penalty would be terrible. I should be thrown to the monsters."

"Can you get us each a ray-gun? Will you risk it, to get back to Earth?" asked Nat.

A pause. Then, "My friend, I am coming."

Nat heard Benson hissing in his ear, "If we can surprise them, we can get possession of the black ship and return."

"We must get Madge Dawes."

"And smash the mirror," put in Brent.

After that there was nothing to do but wait.

The door clicked open. An indistinct form stood in the entrance. It was already growing light; the dark satellite that eclipsed Eros was passing.

"Hush! I have brought you ray-rods!" It was the old man with whom Nat had spoken on the boat. Under his arm he held five metallic rods, tipped with luminous glass. He handed one to each of the prisoners. "Do you know how to use them?" he asked.

Nat examined his. "It's an old-style rod that was used on earth fifty years ago," he told his men. "I've seen them in museums. It came into use in the Second World War of 1950 or thereabouts. You slip back the safety catch and press this button, taking aim as one did with the pistol. You fellows have seen pistols?"

"My father had an old one," said the chief mate, Barnes.

"How many times can they be fired without reloading?" Nat asked the old guard.

"Ten times; sometimes more; and they were all freshly loaded yesterday."

"Take us to where Axelson is."

"First you must destroy the guards. I sent the one on duty here away on some pretext. But the others may be here at any moment. Talk lower. Are you going to kill them?"

"We must," said Nat.

The old fellow began to sob. "We were companions together. They seized us and imprisoned us together, the capitalists, years ago. I thought the proletariat would have won, and you say it is all different. I am an old man, and life is sad and strange."

"Listen. Is Axelson in the house?" demanded Nat.

"He is in his secret room. I do not know the way. None

of us has ever entered it."

"And Madge?"

"She was with him. I do not know anything more." He sank down, groaning, broken.

Nat pushed his way past him. It was fast growing light now. A ray of sunshine shot from beneath the edge of the dark sphere overhead, which still filled almost all the heavens. At that moment the hideous face and squat body of one of the Moon men came into view at the end of the path. The creature stopped, gibbering with surprise, and then rushed forward, mewing like a cat.

Nat aimed his ray-rod and pressed the button. The streak of light, not quite aimed, in Nat's excitement, sheared off one side of the Moon man's face.

The creature rocked where it stood, raised its voice in a screech, and rushed forward again, arms flailing. And this time Nat got home. The streak passed right through the body of the monster, which collapsed into

a heap of calcined carbon.

But its screech had brought the other dwarfs running to the scene. In a moment the path was blocked by a score of the hideous monsters, which, taking in what was happening, came forward in a yelling bunch.

The ray-rods streaked their message of death into the thick of them. Yet so fierce was the rush that some parts got home. Arms, legs, and barrel chests, halves of men, covering the five with that impalpable black powder into which their bodies were dissolving. Nat remembered afterward the horror of a grinning face, apparently loose in the air, and a flailing arm that lashed his chest.

For fifteen seconds, perhaps, it was like struggling with some vampire creatures in a hideous dream. And then, just when it seemed to Nat that he was going mad, he found the path free, and the huddled remnants of the Moon men piled up about him on every side.

He emptied two more ray-shots into the writhing

mass, and saw it cease to quiver and then dissolve into the black powder. He turned and looked at his companions. They, too, showed the horror of the strain they had undergone.

"We must kill the guards now," Nat panted. "And then find Madge and save her."

"We're with you," answered Brent, and together the five rushed into the sunlight and the open.

There were no guards on duty at the entrance of the house, and the door stood wide open. Nat rushed through the door at the head of his men. A single guard was in the hall, but he only looked up as they came in. And it was evident that he was in no condition to resist, for he was in the grip of some terrible disease.

His features were swollen so that they were hardly recognizable, and hoarse, panting breaths came from his lungs. He was so far gone that he hardly registered surprise at the advent of the five.

"Where's Axelson?" demanded Nat.

The guard pointed toward the end of the corridor, then let his arm fall. Nat led his men along the half-dark passage.

At the end of the corridor two more guards were on duty, but one was collapsed upon the floor, apparently unconscious, and the other, making a feeble attempt to draw his ray-rod, crumbled into ashes as Brent fired. The five burst through the door.

They found themselves in the banquet-hall. The remnants of the meal were still upon the table, and three Moon men, looking as if they had been poisoned, were writhing on the floor. At the farther end of the hall was another door.

This gave upon a central hall, with a door in each of its four sides, and a blaze of sunlight coming through the crystal roof. The five stopped, baffled. Then of a sudden Axelson's voice broke the silence—his voice, yet changed almost beyond recognition, hoarse, broken, and gasping:

"Try the doors, Nathaniel Lee. Try each door in turn, and then go back. And know that in an instant I can blast you to nothingness where you stand!"

And suddenly there came Madge's voice, "He can't! He can't, Nat. He's dying, and he knows it. I won't let him, and he hasn't got the strength to move."

"Which door?" cried Nat in desperation.

"None of the doors. They're a trick," came Madge's voice. "Go forward and press the grooved panel upon the wall in front of you."

Nat stepped forward, found the panel, and pressed it. The wall swung open, like two folded doors, revealing another room within, perfectly circular.

It contained a quantity of pieces of apparatus, some glowing with light, some dark, and a radio transmitting set; it was evidently the secret lair of the Black Caesar. And there he was, trapped at last by the mortal illness that had overtaken him!

He was lying upon the couch, his great form stretched out, his features hideously swollen by the same disease that had attacked the guards.

Nat raised his ray-rod, but Axelson feebly put up his hand, and Nat lowered the weapon. And, as the five gathered about the dying man, again Nat felt that strange sense of pathos and pity for him.

He had never known Earth life, and he was not to be measured by the common standards applicable on Earth.

"Don't fire, Nat," said Madge in a shaky voice. She was seated beside Axelson, and—the wonder of it—she was sponging the foam from his lips and moistening his forehead. She raised a crystal that contained some fluid to his lips, and he drained it greedily.

"So—Earth wins, Nathaniel Lee," whispered Axelson hoarsely. "I am dying. I know it. It is the same dreaded disease that came to the Moon at the time of my father's landing there. Three-fourths of the Moon

animals died. It is mortal. The lungs burn away.

"My father told me that on Earth it is not mortal. He called it 'cold'—but I am burning hot."

Then only did Nat understand, and the irony of it made him catch his breath and grit his teeth to check his hysterical laughter. The Black Caesar, the terror of Earth, was dying of a common cold which he himself had given him.

The coryza germ, almost harmless on Earth, among a population habituated to it for countless generations, had assumed the potency of a plague here, where no colds had ever been known—among the Moon men, and even among the guards, after their lifetime in the germless climate of Eros.

"I've failed, Nathaniel Lee," came the Black Caesar's voice. "And yet that hardly troubles me. There is something more that I do not understand. She is a creature like ourselves—with will and reason. She is not like the Moon women. She told me that she did not wish to be queen of the Earth because she did not

love me. I do not understand. And so—I am glad to go."

A gasp came from Axelson's throat as he raised his head and tried to speak, but the death-rattle was already in his throat. A slight struggle, and the massive form upon the couch was nothing but inanimate clay.

Madge rose from beside him, and the tears were streaming down her face.

"He wasn't a bad man, Nat," she said. "He was—gentle with me. He didn't understand; that was all. When I refused to be his queen, he was overcome with bewilderment. Oh, Nat, I can never, never write this story for the Universal News Syndicate."

Nat led her, sobbing, from the room.

Soon he succeeded in getting into teleradio communication with Earth. He broadcast the news that the Black Caesar was dead, and that his power for evil was at an end forever.

Then, in the few hours of daylight that remained, he set his men to work to smash the ray outfit that had destroyed China. There was some principle involved which he did not altogether understand, though Brent professed to have a clue to it, but it was evident that, except for the ray, Axelson had possessed no knowledge superior to that of the Earth scientists.

Of the guards, a few were already recovering, principally those of comparatively younger age. Not a Moon man, on the other hand, had survived the epidemic. As soon as Nat had got the guards out of the house, he reduced it to ashes by the aid of an old-fashioned box of phosphoric matches.

As the dark satellite was again creeping over Eros, the black ship set sail.

But of the return journey to the Moon, where they transferred to their own ship, of their landing at New York, and of the triumphal reception that was accorded them, this is no place to speak. Nat's journey with Madge from the center of the city, in what was the old Borough of Westchester, to his home

in the suburb of Hartford, was a continual ovation.

Crowds lined the air-route, and every few miles, so thick was the air-traffic, he was forced to hover and address the cheering multitudes. Hartford itself was *en fete*, and across the main road the City Bosses had hung an old-fashioned banner, strung from house to house on either side, bearing the legend: For World President: NATHANIEL LEE!

Nat turned to Madge, who was seated beside him silently. "Ever hear of 'getting married?'" he asked.

"Of course I've heard of it," replied the girl indignantly. "Do you think I'm as dumb as that, Nat Lee? Why, those old-fashioned novels are part of the public schools' curriculum."

"Pity those days can't come back. You ought to be a World Presidentess, you know," said Nat. "I was thinking, if we registered as companionates, I could take you into the White House, and you'd have a swell time there taking X-rays on visiting days."

"Well," answered Madge slowly. "I never thought of that. It might be worth trying out."

#43 The Second Satellite, By Edmond Hamilton:

Earth-men war on frog-vampires for the emancipation of the human cows of Earth's second satellite.

Aproximate word count:

Bigotry:

Warnings:

- - -

the city of the frog men!

Norman and Hackett, bulky in their thick flying suits, seemed to fill the little office. Across the room Harding, the field superintendent, contemplated them. Two planes were curving up into the dawn together from the field outside, their motors thunderous as they roared over the building. When their clamor had receded, Harding spoke:

"I don't know which of you two is crazier," he said. "You, Norman, to propose a fool trip like this, or you, Hackett, to go with him."

Hackett grinned, but the long, lean face of Norman was earnest. "No doubt it all sounds a little insane," he said, "but I'm convinced I'm right."

The field superintendent shook his head. "Norman, you ought to be writing fiction instead of flying. A second satellite—and Fellows and the others on it—what the devil!"

"What other theory can account for their disappearance?" asked Norman calmly. "You know

that since the new X-type planes were introduced, hundreds of fliers all over Earth have been trying for altitude records in them. Twenty-five miles—thirty—thirty-five—the records have been broken every day. But out of the hundreds of fliers who have gone up to those immense heights, four have never come down nor been seen again!

"One vanished over northern Sweden, one over Australia, one over Lower California, and one, Fellows, himself, right here over Long Island. You saw the globe on which I marked those four spots, and you saw that when connected they formed a perfect circle around the Earth. The only explanation is that the four fliers when they reached a forty-mile height were caught up by some body moving round Earth in that circular orbit, some unknown moon circling Earth inside its atmosphere, a second satellite of Earth's whose existence has until now never been suspected!"

Harding shook his head again. "Norman, your theory would be all right if it were not for the cold fact that no such satellite has ever been glimpsed."

"Can you glimpse a bullet passing you?" Norman retorted. "The two fliers at Sweden and Lower California vanished within three hours of each other, on opposite sides of the Earth. That means that this second satellite, as I've computed, circles Earth once every six hours, and travelling at that terrific speed it is no more visible to us of Earth than a rifle bullet would be."

"Moving through Earth's atmosphere at such speed, indeed, one would expect it to burn up by its own friction with the air. But it does not, because its own gravitational power would draw to itself enough air to make a dense little atmosphere for itself that would cling to it and shield it as it speeds through Earth's upper air. No, I'm certain that this second satellite exists, Harding, and I'm as certain that it's responsible for the vanishing of those four fliers."

"And now you and Hackett have figured when it will be passing over here and are going up in an X-type yourselves to look for it," Harding said musingly.

"Look for it?" echoed Hackett. "We're not going to

climb forty miles just to get a look at the damn thing—we're going to try landing on it!"

"You're crazy sure!" the field superintendent exploded. "If Fellows and those others got caught by the thing and never came down again, why in the name of all that's holy would you two want—" He stopped suddenly. "Oh, I think I see," he said, awkwardly. "Fellows was rather a buddy of you two, wasn't he?"

"The best that ever flew a crippled Nieuport against three Fokkers to pull us out of a hole," said Norman softly. "Weeks he's been gone, and if it had been Hackett and I he'd be all over the sky looking for us—the damned lunatic. Well, we're not going to let him down."

"I see," Harding repeated. Then—"Well, here comes your mechanic, Norman, so your ship must be ready. I'll go with you. It's an event to see two Columbuses starting for another world."

The gray dawn-light over the flying field was flushing

to faint rose as the three strode out to where the long X-type stood, its strangely curved wings, enclosed cabin and flat, fan-like tail gleaming dully. Its motor was already roaring with power and the plane's stubby wheels strained against the chocks. In their great suits Norman and Hackett were like two immense ape-figures in the uncertain light, to the eyes of those about them.

"Well, all the luck," Harding told them. "You know I'm pulling for you, but—I suppose it's useless to say anything about being careful."

"I seem to have heard the words," Hackett grinned, as he and Norman shook the field superintendent's hand.

"It's all the craziest chance," Norman told the other. "And if we don't come down in a reasonable time—well, you'll know that our theory was right, and you can broadcast it or not as you please."

"I hope for your sake that you're dead wrong," smiled the official. "I've told you two to get off the Earth a lot of times, but I never meant it seriously."

Harding stepped back as the two clambered laboriously into the cramped cabin. Norman took the controls, the door slammed, and as the chocks were jerked back and the motor roared louder the long plane curved up at a dizzy angle from the field into the dawn. Hackett waved a thick arm down toward the diminishing figures on the field below; then turned from the window to peer ahead with his companion.

The plane flew in a narrow ascending spiral upward, at an angle that would have been impossible to any ship save an X-type. Norman's eyes roved steadily over the instrument as they rose, his ears unconsciously alert for each explosion of the motor. Earth receded swiftly into a great gray concave surface as they climbed higher and higher.

By the time the five-mile height was reached Earth's surface had changed definitely from concave to convex. The plane was ascending by then in a somewhat wider spiral, but its climb was as steady and sure as ever. Frost began to form quickly on the cabin's windows, creeping out from the edges.

Norman spoke a word over the motor's muffled thunder, and Hackett snicked on the electrical radiators. The frost crept back as their warm, clean heat flooded the cabin.

Ten miles—fifteen—they had reached already altitudes impossible but a few years before, though it was nothing to the X-types. As they passed the ten-mile mark, Hackett set the compact oxygen-generator going. A clean, tangy odor filled the cabin as it began functioning. Twenty miles—twenty-two—

After a time Norman pointed mutely to the clock on the instrument board, and Hackett nodded. They were well within their time schedule, having calculated to reach the forty-mile height at ten, the hour when, by its computed orbit, the second satellite should be passing overhead. "—26—27—28—" Hackett muttered the altimeter figures to himself as the needle crept over them.

Glancing obliquely down through the window he saw that Earth was now a huge gray ball beneath them, white cloud-oceans obscuring the drab details of its

surface here and there. "—31—32—" The plane was climbing more slowly, and at a lesser angle. Even the X-type had to struggle to rise in the attenuated air now about them. Only the super-light, super-powered plane could ever have reached the terrific height.

It was at the thirty-four mile level that the real battle for altitude began. Norman kept the plane curving steadily upward, handling it with surpassing skill in the rarefied air. Frost was on its windows now despite the heating mechanism. Slowly the altimeter needle crept to the forty mark. Norman kept the ship circling, its wings tilted slightly, but not climbing, Earth a great gray misty ball beneath.

"Can't keep this height long," he jerked. "If our second satellite doesn't show up in minutes we've had a trip for nothing."

"All seems mighty different up here," was Hackett's shouted comment. "Easy enough to talk down there about hopping onto the thing, but up here—hell, there's nothing but air and mighty little of that!"

Norman grinned. "There'll be more. If I'm right about this thing we won't need to hop it—its own atmosphere will pick us up."

Both looked anxious as the motor sputtered briefly. But in a moment it was again roaring steadily. Norman shook his head.

"Maybe a fool's errand after all. No—I'm still sure we're right! But it seems that we don't prove it this time."

"Going down?" asked Hackett.

"We'll have to, in minutes. Even with its own air-feed the motor can't stand this height for—"

Norman never finished the words. There was a sound, a keen rising, rushing sound of immense power that reached their ears over the motor's roar. Then in an instant the universe seemed to go mad about them: they saw the gray ball of Earth and the sun above skyrocketing around them as the plane whirled madly.

The rushing sound was in that moment thunderous, terrible, and as winds smashed and rocked the plane like giant hands, Hackett glimpsed another sphere that was not the sphere of Earth, a greenish globe that expanded with lightning speed in the firmament beside their spinning plane! The winds stilled; the green globe changed abruptly to a landscape of green land and sea toward which the plane was falling! Norman was fighting the controls—land and sea were gyrating up to them with dizzy speed—crash!

With that cracking crash the plane was motionless. Sunlight poured through its windows, and great green growths were all around it. Hackett, despite Norman's warning cry, forced the door open and was bursting outside, Norman after him. They staggered and fell, with curious lightness and slowness, on the ground outside, then clutched the plane for support and gazed stupefiedly around them.

The plane had crashed down into a thicket of giant green reeds that rose a yard over their heads, its pancake landing having apparently not damaged it. The ground beneath their feet was soft and soggy, the

air warm and balmy, and the giant reeds hid all the surrounding landscape from view.

In the sky the sun burned near one horizon with unusual brilliance. But it was dwarfed, in size, by the huge gray circle that filled half the heavens overhead. A giant gray sphere it was, screened here and there by floating white mists and clouds, that had yet plain on it the outlines of dark continents and gleaming seas. A quaking realization held the two as they stared up at it.

"Earth!" Norman was babbling. "It's Earth, Hackett—above us; my God, I can't believe even yet that we've done it!"

"Then we're on—the satellite—the second satellite!—" Hackett fought for reality. "Those winds that caught us—"

"They were the atmosphere of this world, of the second satellite! They caught us and carried us on inside this smaller world's atmosphere, Hackett. We're moving with it around Earth at terrific speed

now!"

"The second satellite, and we on it!" Hackett whispered, incredulously. "But these reeds—it can't all be like this—"

They stepped together away from the plane. The effort sent each of them sailing upward in a great, slow leap, to float down more than a score of feet from the plane. But unheeding in their eagerness this strange effect of the satellite's lesser gravitational power, they moved on, each step a giant, clumsy leap. Four such steps took them out of the towering reeds onto clear ground.

It was a gentle, grassy slope they were on, stretching away along a gray-green sea that extended out to the astoundingly near horizon on their right. To the left it rose into low hills covered with dense masses of green junglelike vegetation. Hackett and Norman, though, gazed neither at sea or hills for the moment, but at the half-score grotesque figures who had turned toward them as they emerged from the reeds. A sick sense of the unreal held them as they gazed,

frozen with horror. For the great figures returning their gaze a few yards from them were—frog-men!

Frog-men! Great mottled green shapes seven to eight feet in height, with bowed, powerful legs and arms that ended in webbed paws. The heads were bulbous ones in which wide, unwinking frog-eyes were set at the sides, the mouths white-lipped and white-lined. Three of the creatures held each a black metal tube-and-handle oddly like a target-pistol.

"Norman!" Hackett's voice was a crescendo of horror.
"*Norman!*"

"Back to the plane!" Norman cried thickly. "The plane —"

The two staggered back, but the frog-men, recovering from their own first surprise, were running forward with great hopping steps! The two fliers flung themselves back in a floating leap toward the reeds, but the green monsters were quick after them. A

croaking cry came from one and as another raised his tube-and-handle, something flicked from it that burst close beside Norman. There was no sound or light as it burst, but the reeds for a few feet around it vanished!

A hoarse cry from Hackett—the creatures had reached him, grasped him at the edge of the reeds! Norman swerved in his floating leap to strike the struggling flier and frog-men. The scene whirled around him as he fought them, great paws reaching for him. With a sick, frantic rage he felt his clenched fist drive against cold, green, billowy bodies. Croaking cries sounded in his ears; then, Hackett and he were jerked to their feet, held tightly by four of the creatures.

"My God, Norman," panted Hackett, helpless. "What are they—frog-things?—"

"Steady, Hackett. They're the people of the second satellite, it seems; wait!"

One of the armed frog-men approached and inspected

them, and then croaked an order in a deep voice. Then, still holding the two tightly, the party of monsters began to move along the slope, skirting the sea's edge. In a few minutes they reached two curious objects resting on the slope. They seemed long black metal boats, slender and with sharp prow and stern. A compact mechanism and control-board filled the prow, while at the stern and sides were long tubes mounted on swivels like machine-guns.

The frog-men motioned Norman and Hackett into one, fastening the two prisoners and themselves into their seats with metal straps provided for the purpose. Four had entered the one boat, the others that of the captives. One at the prow moved his paws over the control-board and with a purring of power the boat, followed by the other, rose smoothly into the air. It headed out over the gray-green sea, land dropping quickly from sight behind, the horizons water-bounded on all sides. From their nearness Norman guessed that this second satellite of Earth's was small indeed beside its mother planet. He had to look up to earth's great gray sphere overhead to attain a sense

of reality.

Hackett was whispering beside him, the frog-men watchful. "Norman, it's not real—it can't be real! These things—these boats—intelligent like men—"

The other sought to steady him. "It's a different world, Hackett. Gravitation different, light different, everything different, and evolution here has had a different course. On Earth men evolved to be the most intelligent life-forms, but here the frog-races, it seems."

"But where are they taking us? Could we ever find the plane again?"

"God knows. If we ever get away from these things we might. And we've got to find Fellows, too; I wonder where he is on this world."

For many minutes the two boats raced on at great speed over the endless waters before the watery skyline was broken far ahead by something dark and unmoving. Hackett and Norman peered with intense

interest toward it. It seemed at first a giant squat mountain rising from the sea, but as they shot nearer they saw that its outline was too regular, and that colossal as it was in size it was the work of intelligence. They gasped as they came nearer and got a better view of it.

For it was a gigantic dome of black metal rising sheer from the lonely sea, ten miles if anything in diameter, a third that in greatest height. There was no gate or window or opening of any kind in it. Just the colossal, smooth black dome rearing from the watery plain. Yet the two boats were flashing lower toward it.

"They can't be going inside!" Hackett conjectured. "There's no way in and what could be in there? The whole thing's mad—"

"There's some way," Norman said. "They're slowing—"

The flying-boats were indeed slowing as they dipped lower. They were very near the dome now, its curving wall a looming, sky-high barrier before them. Suddenly the boats dipped sharply downward toward

the green sea. Before the two fliers could comprehend their purpose, could do aught more than draw instinctive great breaths in preparation, the two craft had shot down into the waters and were arrowing down through the green depths.

Blinded, flung against his metal strap by the resistance of the waters they ripped through, Norman yet retained enough of consciousness to glimpse beams of light that stabbed ahead from the prows of their rushing boats, to see vaguely strange creatures of the deep blundering in and out of those beams as the boats hurtled forward. The water that forced its way between his lips was fresh, he was vaguely aware, and even as he fought to hold his breath was aware too that the frog-men seemed in no way incommoded by the sudden transition into the water, their amphibian nature allowing them to stay under it far longer than any human could do.

The boats ripped through the waters at terrific speed and in a few seconds there loomed before them the giant metal wall of the great dome, going down into the depths here. Norman glimpsed vaguely that the

whole colossal dome rested on a vast pedestal-like mountain of rock that rose from the sea's floor almost to the surface. Then a great round opening in the wall; the boats flashed into it and were hurtling along a water-filled tunnel. Norman felt his lungs near bursting—when the tunnel turned sharply upward and the boats whizzed up and abruptly out of the water-tunnel into air!

But it was not the open air again. They were beneath the gigantic dome! For as Norman and Hackett breathed deep, awe fell on their faces as they took in the scene. Far overhead stretched the dome's colossally curving roof, and far out on all sides. It was lit beneath that roof by a clear light that the two would have sworn was sunlight. The dome was in effect the roof of a gigantic, illuminated building, and upon its floor there stretched a mighty city.

The city of the frog-men! Their boats were rising up over it and Norman and Hackett saw it clear. Square mile upon square mile of structures stretched beneath the dome, black buildings often of immense size, varying in shape, but all of square, rectangular

proportions. Between them moved countless frog-hordes, swirling throngs in streets and squares, and over the roofs darted thick swarms of flying-boats. And at the city's center, in a great, circular, clear space, lay a wide, round, green pool—the opening of the water-tunnel up through which they had come.

Norman pointed down toward it. "That's your answer!" he cried. "The only entrance to this frog-city is from the sea, up through that water-tunnel!"

"Good God, an amphibian city!" Hackett was shaken, white-faced.

The two boats were driving quickly over the city, through the swarming craft. Norman glimpsed towering buildings that might have been palaces, temples, laboratories. They slowed and dipped toward one block-like building not far from the water-tunnel's opening. Armed frog-guards were on its roof, and other boats rested there. The two came to rest and the two captives were jerked out, the guards seizing them.

Half-dragged and half-floating they were led toward an opening in the roof from which a stair led downward. They passed down thus into the building's interior, lit by many windows. Norman glimpsed long halls ending in barred doors, guards here and there. Tube-lines ran along the walls and somewhere machines were throbbing dully. They came at last to a barred door whose guard opened it at the croaking order of the frog-men who held the two, and they were thrust inside, as the door clanged. They turned, and exclaimed in amazement. The room held fully a half-hundred men!

They were men such as the two fliers had never seen before, like humans except that their skins were a light green instead of the normal white and pink. They were dressed in dark short tunics, and kept talking to each other in a tongue quite unintelligible to Norman and Hackett. They came closer, flocking curiously around the two men, with a babel of voices quite meaningless to the two. Then one of the men uttered an exclamation, and all turned.

The barred door had swung open and a half-dozen

frog-guards entered, followed by two frog-men carrying a square little mechanism from which tubing led back out through the door.

"Norman—these men—" Hackett was whispering rapidly. "If there are men in this world too, it may be that—"

"Quiet, Hackett—look at what they're doing."

The two frog-men had set their mechanism in place and then croaked out a brief word or order. Slowly, reluctantly, one of the green men moved toward them. Quickly they removed a metal disk fastened to his arm, exposing a small orifice like an unhealed wound. Onto this they fastened a suckerlike object from which a transparent tube led back through the mechanism. The machine hummed and at once a red stream pulsed through the tube and back through the mechanism. The man to whom it was attached was growing rapidly pale!

Norman, sick with horror, clutched his companion.

"Hackett—these frog-men are sucking his blood from

him!"

"Good God! And look—they're doing it with another!"

"All of these men—kept prisoners to furnish them with blood. It must be the damned creatures' food! And we here with the others—"

A common horror shook the two. It did not seem to affect the green men in the room, though, who advanced to the mechanism one by one with a reluctant air as of cows unwilling to be milked. Each was attached to the mechanism by the sucking disk on his arm, and out of each the blood poured through the tube. The metal disk was replaced on his arm then and he went back to the others. Norman saw that the frog-men took only from each an amount of blood that they could lose and yet live, since, though each came back pale and weak from the mechanism, they were able to walk.

"It must be their food—human blood!" Norman repeated. "They may have thousands on thousands of humans penned up like this, like so many herds of

cows, and perhaps they live entirely on the life-blood they milk from them. Human cows—God!"

"Norman—look—they're calling to us!"

The two stiffened. All the others in the room had taken their turn at the blood-sucking mechanism and now the frog-men croaked their order to the two fliers. They had forgotten their own predicament in the horror of the scene, but now it became real to them. They backed against the room's wall, quivering, dangerous.

The frog-guards came forward to drag them to the machine. A webbed paw was outstretched but Hackett with a wild blow drove the frog-man back and downward. The frog-guards leaped, and Norman and Hackett struck them back with all the greater strength the lesser gravitation gave them. The room was in an uproar, the green men shouting hoarsely and seeming on the point of rushing to their aid.

But the menacing force-pistols of the other frog-guards held back the shouting men and in moments

the two fliers were overpowered by sheer weight of frog-bodies. Norman felt himself dragged to the machine.

Pain needled his upper arm as an incision was made. He felt the sucking-disk attached; then the machine hummed, and a sickening nausea swept him as the blood drained from his body. Held tightly by the guards he went dizzy, weak, but at last felt the sucker removed and a metal disk fastened over the incision. He was jerked aside and Hackett, his face deathly white, was dragged into his place. In a moment some of the latter's blood had been pumped from him also.

The machine was withdrawn, Norman and Hackett were released, and the frog-men, with their black force-pistols watchfully raised, withdrew, the door clanging. The room settled back to quietness, the green men stretching in lassitude on the metal bunks around it. The two fliers crouched down near the door, shuddering nausea and weakness still holding them.

Norman found that Hackett was laughing weakly. "To

think that twenty-four hours ago I was in New York," he half-laughed, half-sobbed. "On Earth—Earth—"

The other gripped his arm. "It's horrible, Hackett, I know. But it isn't instant death, and we've still a chance to escape. Hell, can damn frog-men keep us here? Where's your nerve, man?"

A voice beside them made them turn in amazement. "You are men from Earth?" it asked, in queerly accented English. "From Earth?"

Astonishment held them as they saw who spoke. It was one of the green men in the room, who had settled down by their side. A tall figure with superb muscles and frank, clean countenance, his dark eyes afire with eagerness.

"English?" Norman exclaimed. "You know English—you understand me?"

The other showed his teeth in a smile. "I know, yes. I'm Sarja, and I learned to speak it from Fallas, in my city, before the Ralas caught me."

"Fallas—" Norman repeated, puzzled; then suddenly he flamed. "By God, he means Fellows!"

"Fallas, yes," said the other. "From the sky he fell into our city in a strange flying-boat that was smashed. He was hurt but we cared for him, and he taught me his speech, which I heard you talking now."

"Then Fellows is in your city now?" asked Hackett eagerly. "Where is that?"

"Across this sea—back in the hills," the other waved. "It is far from the sea but I was rash one day and came too near the water in my flying-boat. The Ralas were out raiding and they saw me, caught me, and brought me here. No escape now, until I die."

"The Ralas—you mean these frog-men?" Norman asked.

Sarja nodded. "Of course. They are the tyrants and oppressors of this world. Our little world is but a tenth or less the size of your great Earth which it circles, but it has its lands and rivers, and this one

great fresh-water sea into which the latter empty. In this sea long ago developed the Ralas, the great frog-men who acquired such intelligence and arts that they became lords of this world.

"Through the centuries, while on the land our races of green men have been struggling upward, the Ralas have oppressed them. Long ago the Ralas left all their other cities to build this one great amphibian city at the sea's center. Entrance to it is only by the water-tunnel from without, and being frog-people entrance thus is easy for them since they can move for many minutes under water, though they drown like any other breathing animal if kept under too long.

Humans dare not try to enter it thus by the water-tunnel, since, before they could find it and make their way up through it, they would have drowned.

"So the Ralas have ruled from this impregnable amphibian city. Its colossal metal dome is invulnerable to ordinary attack, and though solid and without openings it is always as light beneath the dome here as outside, since the Ralas' scientists contrived light-condensers and conductors that catch

light outside and bring it in to release inside. So when it is day outside the sunlight is as bright here, and when night comes the Earth-light shines here the same as without.

"From this city their raiding parties have gone out endlessly to swoop down on the cities of us green men. Since we learned to make flying-boats like theirs, with molecular-motors, and to make the guns like theirs that fire shells filled with annihilating force, we have resisted them stoutly but their raids have not ceased. And always they have brought their prisoners back in to this, their city.

"Tens of thousands of green men they have prisoned here like us, for the sole purpose of supplying them with blood. For the Ralas live on this blood alone, changing it chemically to fit their own bodies and then taking it into their bodies. It eliminates all necessity for food here for them. Every few days they drain blood from us, and since we are well fed and cared for to keep us good blood-producers, we will be here for a long time before we die."

"But haven't you made any attempt to get out of here—to escape?" Norman asked.

Sarja smiled. "Who could escape the city of the Ralas? In all recorded history it has never been done, for even if by some miracle you got a flying-boat, the opening of the water-tunnel that leads outward is guarded always."

"Guards or no guards, we're going to try it and not sit here to furnish blood for the Ralas," Norman declared. "Are you willing to help, to try to get to Fellows and your city?"

The green man considered. "It is hopeless," he said, "but as well to die beneath the force-shells of the Ralas as live out a lifetime here. Yes, I will help, though I cannot see how you expect to escape even from this room."

"I think we can manage that," Norman told him. "But first—not a word to these others. We can't hope to escape with them all, and there is no knowing what one might not betray us to the frog-men."

He went on then to outline to the other two the idea that had come to him. Both exclaimed at the simpleness of the idea, though Sarja remained somewhat doubtful. While Hackett slept, weak still from his loss of blood, Norman had the green man scratch on the metal floor as well as possible a crude map of the satellite's surface, and found that the city, where Fellows was, seemed some hundreds of miles back from the sea.

While they talked, the sunlight, apparently sourceless, that came through the heavily barred windows of the room faded rapidly, and dusk settled over the great amphibian city beneath the giant dome, kept from total darkness by a silvery pervading light that Norman reflected must be the light from Earth's great sphere. With the dusk's coming the activities in the frog-city lessened greatly.

With dusk, too, frog-guards entered the room bearing long metal troughs filled with a red jellylike substance, that they placed on racks along the wall. As the guards withdrew the men in the room rushed toward the troughs, elbowing each other aside and

striking each other to scoop up and eat as much of the red jelly as possible. It was for all the world like the feeding of farm-animals, and Hackett and Norman so sickened at the sight that they had no heart to try the food. Sarja, though, had no such scruples and seemed to make a hearty meal at one of the troughs.

After the meal the green men sought the bunks and soon were stretched in sonorous slumber. It was, Norman reflected, exactly the existence of domesticated animals—to eat and sleep and give food to their masters. A deeper horror of the frog-men shook him, and a deeper determination to escape them. He waited until all in the room were sleeping before beckoning to Sarja and Hackett.

"Quiet now," he whispered to them. "If these others wake they'll make such a clamor we won't have a chance in the world. Ready, Sarja?"

The green man nodded. "Yes, though I still think such a thing's impossible."

"Probably is," Norman admitted. "But it's the one

chance we've got, the immensely greater strength of our Earth-muscle that the frog-men must have forgotten when they put us in here."

They moved silently to the room's great barred door, outside which a frog-guard paced. They waited until he had passed the door and on down the hall, then Norman and Hackett and Sarja grasped together one of the door's vertical bars. It was an inch and a half in thickness, of solid metal, and it seemed ridiculous that any men could bend it by the sheer strength of their muscles.

Norman, though, was relying on the fact that on the second satellite, with its far lesser gravitational influence, their Earth-muscles gave them enormous strength. He grasped the bar, Hackett and Sarja gripping it below him, and then at a whispered word they pulled with all their force. The bar resisted and again, with sweat starting on their foreheads, they pulled. It gave a little.

They shrank back from it as the guard returned, moving past. Then grasping the bar again they bent

all their force once more upon it. Each effort saw it bending more, the opening in the door's bars widening. They gave a final great wrench and the bent bar squealed a little. They shrank back, appalled, but the guard had not heard or noticed. He moved past it on his return along the hall, and no sooner was past it than Norman squeezed through the opening and leaped silently for the great frog-man's back.

It went down with a wild flurry of waving webbed paws and croaking cries, stilled almost instantly by Norman's terrific blows. There was silence then as Hackett and Sarja squeezed out after him, the momentary clamor of the battle having aroused no one.

The three leaped together toward the stairs. In two great floating leaps they were on the floor above, Hackett and Norman dragging Sarja between them. They were not seen, were sailing in giant steps up another stair, hopes rising high. The last stair—the roof-opening above; and then from beneath a great croaking cry swelled instantly into chorus of a alarmed shouts.

"They've found the door—the guard!" panted Hackett.

They were bursting out onto the roof. Frog-guards were on it who came in a hopping rush toward them, force-pistols raised. But a giant leap took Hackett among them, to amaze them for a moment with great flailing blows. Sarja had leaped for the nearest flying-boat resting on the roof, and was calling in a frantic voice to Norman and Hackett. Norman was turning toward Hackett, the center of a wild combat, but the latter emerged from it for a brief second to motion him frantically back.

"No use, Norman—get away—get away!" he cried hoarsely, frenziedly.

"Hackett—for God's sake—!" Norman half-leaped to the other, but an arm caught him, pulled him desperately onto the boat's surface. It was Sarja, the long craft flying over the roof beneath his control.

"They come!" he panted. "Too late now—" Frog-men were pouring up onto the roof from below. Sarja sent the craft rocketing upward, as Hackett gestured them

away for a last frantic time before going down beneath the frog-men's onslaught.

The roof and the combat on it dropped back and beneath them like a stone as their craft ripped across the silvery dusk over the mighty frog-city. They were shooting toward the city's center, toward the green pool that was the entrance to the water-tunnel, while behind and beneath an increasing clamor of alarm spread swiftly. Norman raged futilely.

"Hackett—Hackett! We can't leave him—"

"Too late!" Sarja cried. "We cannot help him but only be captured again. We escape now and come back—come back—"

The truth of it pierced Norman's brain even in the wild moment. Hackett had fought and held back the frog-guards only that they might escape. He shouted suddenly.

"Sarja—the water-tunnel!" A half-dozen boats with frog-guards on them were rising round it in answer to

the alarm!

"The force-gun!" cried the green man. "Beside you—!"

Norman whirled, glimpsed the long tube on its swivel beside him, trained it on the boats rising ahead as they rocketed nearer. He fumbled frantically at a catch at the gun's rear, then felt a stream of shells flicking out of it. Two of the boats ahead vanished as the shells released their annihilating force, another sagged and fell. From the remaining three invisible force-shells flicked around them, but in an instant Sarja had whirled the boat through them and down into the water-tunnel!

Norman clung desperately to his seat as the boat flashed down through the waters, and then, as Sarja sent it flying out through the great tunnel's waters, glimpsed, close behind, the beams of the three Rala boats as they pursued them through the tunnel, overtaking them. Could the force-shells be fired under water? Norman did not know, but desperately he swung the force-gun back as they rushed through the waters, and pressed the catch. An instant later beams

and boats behind them in the tunnel vanished.

His lungs were afire; it seemed that he must open them to the strangling water. The boat was ripping the waters at such tremendous speed that he felt himself being torn from his hold on it. Pain seemed poured like molten metal through his chest—he could hold out no longer; and then the boat stabbed up from the waters into clear air!

Norman panted, sobbed. Behind them rose the colossal metal dome of the frog-city, gleaming dully in the silvery light that flooded the far-stretching seas. That light poured down from a stupendous silver crescent in the night skies. Norman saw dully the dark outlines on it before he remembered. Earth! He laughed a little hysterically. Sarja was driving the flying-boat out over the sea and away from the frog-city at enormous speed. At last he glanced back. Far behind them lay the great dome and up around it gleaming lights were pouring, lights of pursuing Rala boats.

"We escape," Sarja cried, "the city of the Ralas, from

which none ever before escaped!"

Remembrance smote Norman. "Hackett! Held off those frog-men so we could get away—we'll come back for him, by God!"

"We come back!" said Sarja. "We come back with all the green men of this world to the Ralas' city, yes! I know what Fallas has planned."

"Can you find your way to him—to your city?" Norman asked.

Sarja nodded, looking upward. "Before the next sun has come and gone we can reach it."

The boat flew onward, and the great dome and the searching lights around it dropped beneath the horizon. Norman felt the warm wind drying his drenched garments as they rushed onward. Crouched on the boat he gazed up toward the silver crescent of Earth sinking toward the horizon ahead. That meant, he told himself, that the satellite turned slowly on its axis as it whirled around Earth. It came to him that its

night and day periods must be highly irregular.

When the sun climbed from the waters behind them they were flying still over a boundless waste of waters, but soon they sighted on the horizon ahead the thin green line of land. Sarja slowed as they reached it, took his bearings, and sent the craft flying onward.

They passed over a green coastal plain and then over low hills joined in long chains and mantled by dense and mighty jungles, towering green growths of unfamiliar appearance to Norman. He thought he glimpsed, more than once, huge beastlike forms moving in them. He did see twice in the jungles great clearings where were fair-sized cities of bright-green buildings, a metal tower rising from each. But when he pointed to them Sarja shook his head.

At last, as they passed over another range of hills and came into sight of a third green city with its looming tower, the other pointed, his face alight.

"My city," he said. "Fallas there."

Fellows! Norman's heart beat faster.

They shot closer and lower and he saw that the buildings were obviously green to lend them a certain protective coloration similar to that of the green jungles around them. The tower with its surmounting cage puzzled him though, but before he could ask Sarja concerning it his answer came in a different way. A long metal tube poked slowly out of the cage on the tower's top and sent a hail of force-shells flicking around them.

"They're firing on us!" Norman cried. "This can't be your city!"

"They see our black boat!" Sarja exclaimed. "They think we're Rala raiders and unless we let them know they'll shoot us out of the air! Stand up—wave to them—!"

Both Norman and Sarja sprang to their feet and waved wildly to those in the tower-cage, their flying-boat drifting slowly forward. Instantly the force-shells ceased to hail toward them, and as they moved nearer

a sirenlike signal broke from the cage. At once scores of flying-boats like their own, but glittering metal instead of black, shot up from the city where they had lain until now, and surrounded them.

As Sarja called in his own tongue to them the green men on the surrounding boats broke into resounding cries. They shot down toward the city, Norman gazing tensely. Great crowds of green men in their dark tunics had swarmed out into its streets with the passing of the alarm, and their craft and the others came to rest in an open square that was the juncture of several streets.

The green men that crowded excitedly about Norman and Sarja gave way to a half-dozen hurrying into the square from the greatest of the buildings facing on it. All but one were green men like the others. But that one—the laughing-eyed tanned face—the worn brown clothing, the curious huge steps with which he came—Norman's heart leapt.

"Fellows!"

"Great God—Norman!" The other's face was thunderstruck. "Norman—how by all that's holy did you get here?"

Norman, mind and body strained to the breaking point, was incoherent. "We guessed how you'd gone—the second satellite, Fellows—Hackett and I came after you—taken to that frog-city—"

As Norman choked the tale, Fellows' face was a study. And when it was finished he swallowed, and gripped Norman's hand viselike.

"And you and Hackett figured it out and came after me—took that risk? Crazy, both of you. Crazy—"

"Fellows, Hackett's still there, if he's alive! In the Rala city!"

Fellows' voice was grim, quick. "We'll have him out. Norman, if he still lives. And living or dead, the Ralas will pay soon for this and for all they've done upon this world in ages. Their time nears—yes."

He led Norman, excited throngs of the green men about them, into the great building from which he had emerged. There were big rooms inside, workshops and laboratories that Norman but vaguely glimpsed in passing. The room to which the other led him was one with a long metal couch. Norman stretched protestingly upon it at the other's bidding, drifted off almost at once into sleep.

He woke to find the sunlight that had filled the room gone and replaced by the silvery Earth-light. From the window he saw that the silver-lit city outside now held tremendous activity, immense hordes of green men surging through it with masses of weapons and equipment, flying-boats pouring down out of the night from all directions. He turned as the door of the room clicked open behind him. It was his old friend Fellows.

"I thought you'd be awake by now, Norman. Feeling fit?"

"As though I'd slept a week," Norman said, and the other laughed his old care-free laugh.

"You almost have, at that. Two days and nights you've slept, but it all adds up to hardly more than a dozen hours."

"This world!" Norman's voice held all his incredulity. "To think that we should be on it—a second satellite of Earth's—it seems almost beyond belief."

"Sometimes it seems so to me, too," Fellows said thoughtfully. "But it's not a bad world—not the human part of it, at least. When this satellite's atmosphere caught me and pitchforked me down among these green men, smashing the plane and almost myself, they took care of me. You say three others vanished as I did? I never heard of them here; they must have crashed into the sea or jungles. Of course, I'd have got back to Earth on one of these flying-boats if I'd been able, but their molecular power won't take them far from this world's surface, so I couldn't."

"As it was, the green men cared for me, and when I found how those frog-men have dominated this world for ages, how that city of the Ralas has spread endless terror among the humans here, I resolved to

smash those monsters whatever I did. I taught some of the green men like Sarja my own speech, later learning theirs, and in the weeks I've been here I've been working out a way to smash the Ralas.

"You know that amphibian city is almost impregnable because humans can hardly live long enough under the water to get into it, let alone fight under water as the frog-men can. To meet them on even terms the green men needed diving-helmets with an oxygen supply. They'd never heard of such an idea, too afraid of the sea ever to experiment in it, but I convinced them and they've made enough helmets for all their forces. In them they can meet the Ralas under water on equal terms.

"And there's a chance we can destroy that whole Rala city with their help. It's built on a giant pedestal of rock rising from the sea's floor, as you saw, and I've had some of the green men make huge force-shells or force-bombs that ought to be powerful enough to split that pedestal beneath the city. If we can get a chance to place those bombs it may smash the frog-men forever on this world. But one thing is sure: we're

going to get Hackett out if he still lives!"

"Then you're, going to attack the Rala city now?"

Norman cried.

Fellows nodded grimly. "While you have slept all the forces of the green men on this world have been gathering. Your coming has only precipitated our plans, Norman—the whole soul of the green races has been set upon this attack for weeks!"

Norman, half bewildered at the swiftness with which events rushed upon him, found himself striding with Fellows in great steps out through the building into the great square. It was shadowed now by mass on mass of flying-boats, crowded with green men, that hung over it and over the streets. One boat, Sarja at its controls, waited on the ground and as they entered and buckled themselves into the seats the craft drove up to hang with the others.

A shattering cheer greeted them. Norman saw that in the silvery light of Earth's great crescent there stretched over the city and surrounding jungle now a

veritable plain of flying-boats. On each were green men and each bristled with force-guns, and had as many great goggled helmets fastened to it as it had occupants. He glimpsed larger boats loaded with huge metal cylinders—the force-bombs Fellows had mentioned.

Fellows rose and spoke briefly in a clear voice to the assembled green men on their craft, and another great shout roared from them, and from these who watched in the city below. Then as he spoke a word, Sarja sent their craft flying out over the city, and the great mass of boats, fully a thousand in number, were hurtling in a compact column after them.

Fellows leaned to Norman as the great column of purring craft shot on over the silver-lit jungles. "We'll make straight for the Rala city and try setting into it before they understand what's happening."

"Won't they have guards out?"

"Probably, but we can beat them back into the city before their whole forces can come out on us. That's

the only way in which we can get inside and reach Hackett. And while we're attacking the force-bombs can be placed, though I don't rely too much on them."

"If the attack only succeeds in getting us inside," Norman said, grim-lipped, "we'll have a chance—"

"It's on the knees of the gods. These green men are doing an unprecedented thing in attacking the Ralas, the masters of this world, remember. But they've got ages of oppression to avenge; they'll fight."

The fleet flew on, hills and rivers a silver-lit panorama unreeling beneath them. Earth's crescent sank behind them, and by the time they flashed out over the great fresh-water sea, the sun was rising like a flaming eye from behind it. Land sank from sight behind and the green men were silent, tense, as they saw stretching beneath only the gray waters that for ages had been the base of the dread frog-men. But still the fleet's column raced on.

At last the column slowed. Far ahead the merest bulge broke the level line where sky and waters met.

The amphibian city of the Ralas! At Fellows' order-the flying-boats sank downward until they moved just above the waters. Another order made the green hosts don the grotesque helmets. Norman found that while cumbersome their oxygen supply was unfailing. They shot on again at highest speed, but as the gigantic black dome of the frog-city grew in their vision there darted up from around it suddenly a far-flung swarm of black spots.

"Rala boats!"

The muffled exclamation was Fellows'. There needed now no order on his part, though. Like hawks, leaping for prey, the fleet of the green men sprang through the air. Norman, clutching the force-gun between his knees, had time only to see that the Rala craft were a few hundred in number and that, contemptuous of the greater odds that favored these humans they had so long oppressed, they were flying straight to meet them. Then the two fleets met—and were spinning side by side above the waters.

Norman saw the thing only as a wild whirl of Rala

boats toward and beside them, great green frog-men crowding the craft, their force-guns hailing shells. Automatically, with the old air-fighting instinct, his fingers had pressed the catch of the gun between his knees and as its shells flicked toward the rushing boats he saw areas of nothingness opening suddenly in their mass, shells striking and exploding in annihilating invisibility there and in their own fleet.

The two fleets mingled and merged momentarily, the battle becoming a thing of madness, a huge whirl of black and glittering flying-boats together, striking shells exploding nothingness about them. The Ralas were fighting like demons.

The merged, terrific combat lasted but moments; could last but moments. Norman, his gun's magazine empty, seemed to see the mass of struggling ships splintering, diverging; then saw that the black craft were dropping, plummeting downward toward the waves! The Ralas, stunned by that minute of terrific combat, were fleeing. Muffled cries and cheers came from about him as the glittering flying-boats of the green men shot after them. They crashed down into

the waters and curved deeply into their green-depths, toward the gigantic dome.

Ahead the Rala boats were in flight toward their city, and now their pursuers were like sharks striking after them. There in the depths the force-guns of black and glittering boats alike were spitting, and giant waves and underwater convulsions rocked pursued and pursuers as the exploding shells annihilated boats and water about them. The tunnel! Its round opening yawned in the looming wall ahead, and Norman saw the Rala craft, reduced to scores in number, hurtling into it, to rouse all the forces of the great amphibian city. Their own boats were flashing into the opening after them. He glimpsed as he glanced back for a moment the larger craft with the great force-bombs veering aside behind them.

It was nightmare in the water-tunnel. Flashing beams of the craft ahead and waters that rocked and smashed around them as in flight the Ralas still rained back force-shells toward them in a chaos of action. Once the frog-men turned to hold them back in the tunnel, but by sheer weight the rushing ships of

the green men crashed them onward. Boats were going into nothingness all around them. A part of Norman's brain wondered calmly why they survived even while another part kept his gun again working, with refilled magazine. Fellows and Sarja were grotesque shapes beside him. Abruptly the tunnel curved upward and as they flashed up after the remaining Rala craft their boats ripped up into clear air! They were beneath the giant dome!

The frog-men chased inward spread out in all directions over their mighty, swarming city and across it a terrific clamor of alarm ran instantly as the green men emerged after them! Norman saw flying-boats beginning to rise across all the city and realized that moments would see all the immense force of the Ralas, the thousands of craft they could muster, pouring upon them. He pointed out over the city to a block-like building, and shouted madly through his helmet to Fellows and Sarja:

"Hackett!"

But already Sarja had sent their craft whirling across

the city toward the structure, half their fleet behind it, with part still emerging from the water-tunnel. Rala boats rose before them, but nothing could stop them now, their force-shells raining ahead to clear a path for their meteor-flight. They shot down toward the block-structure, and Norman, half-crazed by now, saw that to descend and enter was suicide in the face of the frog-forces rising now over all the city. He cried to Fellows, and with two of the guns as they swooped lower they sprayed force-shells along the building's side.

The shells struck and whiffed away the whole side, exposing the level on the building's interior. Out from it rushed swarms of crazed green men, sweeping aside the frog-men guards, while far over the city the invading craft were loosing shells on the block-like buildings that held the prisoners, tens of thousands of them swarming forth. In the throng below as they raced madly forth Norman saw one, and shouted wildly. The one brown garbed figure looked up, saw their boat swooping lower, and leaped for it in a tremendous forty-foot spring that brought his fingers

to its edge. Norman pulled him frenziedly up.

"Norman!" he babbled. "In God's name—Fellows—!"

"That helmet, Hackett!" Fellows flung at him. "My God, look at those prisoners—Norman!"

The countless thousands of green men released from the buildings whose walls had vanished under the shells of the invaders had poured forth to make the amphibian city a chaos of madness. Oblivious to all else they were throwing themselves upon the city's crowding frog-men in a battle whose ferocity was beyond belief, disregarding all else in this supreme chance to wreak vengeance on the monstrous beings who had fed upon their blood. In the incredible insanity of that raging fury the craft of the green men hanging over the city were all but forgotten.

Suddenly the city and the mighty dome over it quivered violently, and then again. There came from beneath a dull, vast, grinding roar.

"The great force-bombs!" Fellows screamed. "They've

set them off—the city's sinking—out of here, for the love of God!"

The boat whirled beneath Sarja's hands toward the pool of the water-tunnel, all their fleet rushing with them. The grinding roar was louder, terrible; dome and city were shaking violently now; but in the insensate fury of their struggle the frog-men and their released prisoners were hardly aware of it. The whole great dome seemed sinking upon them and the city falling beneath it as Sarja's craft ripped down into the tunnel's waters, and then out, at awful speed, as the great tunnel's walls swayed and sank around them! They shot out into the green depths from it to hear a dull, colossal crashing through the waters from behind as the great pedestal of rock on which the city had stood, shattered by the huge force-bombs, collapsed. And as their boats flashed up into the open air they saw that the huge dome of the city of the Ralas was gone.

Beneath them was only a titanic whirlpool of foaming waters in which only the curved top of the settling dome was visible for a moment as it sank slowly and

ponderously downward, with a roar as of the roar of falling worlds. Buckling, collapsing, sinking, it vanished in the foam-wild sea with all the frog-men who for ages had ruled the second satellite, and with all those prisoners who had at the last dragged them down with them to death! Ripping off their helmets, with all the green men shouting crazily about them, Norman and Fellows and Hackett stared down at the colossal maelstrom in the waters that was the tomb of the masters of a world.

Then the depression's sides collapsed, the waters rushing together ... and beneath them was but troubled, tossing sea....

Earth's great gray ball was overhead again and the sun was sinking again to the horizon when the three soared upward in the long, gleaming plane, its motor roaring. Norman, with Hackett and Fellows crowding the narrow cabin beside him, waved with them through its windows. For all around them were rising the flying-boats of the green men.

They were waving wildly, shouting their farewells,

Sarja's tall figure erect at the prow of one. Insistent they had been that the three should stay, the three through whom the monstrous age-old tyranny of the frog-men had been lifted, but Earth-sickness was on them, and they had flown to where the plane lay still unharmed among the reeds, a hundred willing hands dragging it forth for the take-off.

The plane soared higher, motor thundering, and they saw the flying-boats sinking back from around them. They caught the wave of Sarja's hand still from the highest, and then that, too, was gone.

Upward they flew toward the great gray sphere, their eyes on the dark outlines of its continents and on one continent. Higher—higher—green land and gray tea receding beneath them; Hackett and Fellows intent and eager as Norman kept the plane rising. The satellite lay, a greenish globe, under them. And as they went higher still a rushing sound came louder to their ears.

"The edge of the satellite's atmosphere?" Fellows asked, as Norman nodded.

"We're almost to it—here we go!"

As he shot the plane higher, great forces smote it, gray Earth and green satellite and yellow sun gyrating round it as it reeled and plunged. Then suddenly it was falling steadily, gray Earth and its dark continent now beneath, while with a dwindling rushing roar its second satellite whirled away above them, passing and vanishing. Passing as though, to Norman it seemed, all their strange sojourn on it were passing; the frog-men and their mighty city, Sarja and their mad flight, the green men and the last terrific battle; all whirling away—whirling away.

#44 Silver Dome, By Harold Vincent Schoepflin:

In her deep-buried kingdom of Theros, Phaestra reveals the amazing secret of the silver dome.

orris led the way

In a secluded spot among the hills of northern New Jersey stood the old DeBost mansion, a rambling frame structure of many wings and gables that was well-nigh hidden from the road by the half-mile or more of second-growth timber which intervened. High on the hill it stood, and it was only by virtue of its altitude that an occasional glimpse might be obtained of weatherbeaten gable or partly tumbled-down chimney. The place was reputed to be haunted since the death of old DeBost, some seven years previously,

and the path which had once been a winding driveway was now seldom trod by human foot.

It was now two years since Edwin Leland bought the estate for a song and took up his residence in the gloomy old house. And it had then been vacant for five years since DeBost shot himself in the northeast bedroom. Leland's associates were sure he would repent of his bargain in a very short time, but he stayed on and on in the place, with no company save that of his man-servant, an aged hunch-back who was known to outsiders only as Thomas.

Leland was a scientist of note before he buried himself in the DeBost place, and had been employed in the New York research laboratory of one of the large electrical manufacturers, where he was much admired and not a little envied by his fellow workers. These knew almost nothing of his habits or of his personal affairs, and were much surprised when he announced one day that he had come into a sizable fortune and was leaving the organization to go in for private research and study. Attempts to dissuade him were of no avail, and the purchase of the DeBost

property followed, after which Leland dropped from sight for nearly two years.

Then, on a blustery winter day, a strange telephone call was received at the laboratory where he had previously worked. It was from old Thomas, out there in the DeBost mansion, and his quavering voice asked for Frank Rowley, the genial young engineer whose work had been most closely associated with Leland's.

"Oh, Mr. Rowley," wailed the old man, when Frank responded to the call, "I wish you would come out here right away. The master has been acting very queerly of late, and to-day he has locked himself in his laboratory and will not answer my knocks."

"Why don't you break in the door?" asked Frank, looking through the window at the snow storm that still raged.

"I thought of that, Mr. Rowley, but it is of oak and very thick. Besides, it is bound with steel or iron straps and is beyond my powers."

"Why not call the police?" growled Frank. He did not relish the idea of a sixty or seventy mile drive in the blizzard.

"Oh—no—no—no!" Old Thomas was panicky at the suggestion. "The master told me he'd kill me if I ever did that."

Before Frank could formulate a reply, there came a sharp gasp from the other end of the line, a wailing cry and a thud as of a falling body; then silence. All efforts to raise Leland's number merely resulted in "busy" or "line out of order" reports.

Frank Rowley was genuinely concerned. Though he had never been a close friend of Leland's, the two had worked on many a knotty problem together and were in daily contact during the nearly ten years that the other man had worked in the same laboratory.

"Say, Tommy," said Frank, replacing the receiver and turning to his friend, Arnold Thompson, who sat at an adjoining desk, "something has happened out at Leland's place in Sussex County. Want to take a drive

out there with me?"

"What? On a day like this? Why not take the train?"

"Don't be foolish, Tommy," said Frank. "The place is eight miles from the nearest station, which is a flag stop out in the wilds. And, even if you could find a cab there—which you couldn't—there isn't a taxi driver in Jersey who'd take you up into those mountains on a day like this. No, we'll have to drive. It'll be okay. I've got chains on the rear and a heater in the old coupe, so it shouldn't be so bad. What do you say?"

So Tommy, who usually followed wherever Frank led, was prevailed upon to make the trip. He had no particular feeling for Leland, but he sensed an adventure, and, in Frank's company, he could ask for no more.

Frank was a careful driver, and three hours were required to make the sixty-mile journey. Consequently, it was late in the afternoon when they arrived at the old DeBost estate. It had stopped snowing, but the drifts were deep in spots, and Frank soon found that

the car could not be driven through the winding path from the road to the house. So they left it half buried in a drift and proceeded on foot.

It was a laborious task they had undertaken, and, by the time they set foot on the dilapidated porch, even Frank, husky and athletic as was his build, was puffing and snorting from his exertions. Little Tommy, who tipped the scales at less than a hundred and twenty, could hardly speak. They both were wet to the waist and in none too good humor.

"Holy smoke!" gasped Tommy, stamping the clinging snow from his sodden trouser legs and shoes, "if it snows any more, how in Sam Hill are we going to get out of this place?"

"Rotten trip I let you in for Tommy," growled Frank, "and I hope Leland's worth it. But, darn it all, I just had to come."

"It's all right with me, Frank. And maybe it'll be worth it yet. Look—the front door's open."

He pointed to the huge oaken door and Frank saw that it was ajar. The snow on the porch was not deep and they saw that footprints led from the open door to a corner of the porch. At that point the snow on the railing was disturbed, as if a hurrying man had clung to it a moment before jumping over and into the drifts below. But the tracks led no further, for the drifting snow had covered all excepting a hollow where some body had landed.

"Thomas!" exclaimed Frank. "And he was in a hustle, by the looks of the tracks. Bet he was frightened while at the telephone and beat it."

They entered the house and closed the door behind them. It was growing quite dark and Frank searched for the light switch. This was near the door, and, at pressure on the upper button, the spacious old hall with its open staircase was revealed dimly by the single remaining bulb in a cluster set in the center of the high ceiling. The hall was unfurnished, excepting for a telephone table and chair, the chair having fallen to the floor and the receiver of the telephone dangling from the edge of the table by its cord.

"You must have heard the chair fall," commented Tommy, "and it sure does look as if Thomas left in a hurry. Wonder what it was that frightened him?"

The house was eerily silent and the words echoed awesomely through the adjoining rooms which connected with the hall through large open doorways.

"Spooky place, isn't it?" returned Frank.

And then they were both startled into immobility by a rumble that seemed to shake the foundations of the house. Heavier and heavier became this vibration, as if some large machine was coming up to speed. Louder and louder grew the rumble until it seemed that the rickety old house must be shaken down about their ears. Then there came a whistling scream from the depths of the earth—from far underground it seemed to be—and this mounted in pitch until their eardrums tingled. Then abruptly the sounds ceased, the vibration stopped, and once more there was the eerie silence.

Rather white-faced, Tommy gazed at Frank.

"No wonder old Thomas beat it!" he said. "What on earth do you suppose that is?"

"Search me," replied Frank. "But whatever it is, I'll bet it has something to do with Leland's strange actions. And we're going to find out."

He had with him the large flashlamp from the car, and, by its light, the two made their way from room to room searching for the iron-bound door mentioned by Thomas.

They found all rooms on the first and second floors dusty and unused with the exception of two bedrooms, the kitchen and pantry, and the library. It was a gloomy and spooky old house. Floor boards creaked startingly and unexpectedly and the sound of their footsteps echoed dismally.

"Where in time is that laboratory of Leland's?" exclaimed Frank, his ruddy features showing impatient annoyance, exaggerated to an appearance of ferocity by the light of the flashlamp.

"How about the cellar?" suggested Tommy.

"Probably where it is," agreed Frank, "but I don't relish this job so much. I'd hate to find Leland stiff down there, if that's where he is."

"Me, too," said Tommy. "But we're here now, so let's finish the job and get back home. It's cold here, too."

"You said it. No steam in the pipes at all. He must have let the fire go out in his furnace, and that's probably in the cellar too—usually is."

While talking, Frank had opened each of the four doors that opened from the kitchen, and the fourth revealed a stairway that led into the blackness beneath. With the beam of his torch directed at the steps, he proceeded to descend, and Tommy followed carefully. There was no light button at the head of the stairs, where it would have been placed in a more modern house, and it was not until they had reached the furnace room that they located a light fixture with a pull cord. An ordinary cellar, with furnace, coal bin, and a conglomeration of dust-covered trunks and

discarded furniture, was revealed. And, at its far end, was the iron-bound door.

The door was locked and could not be shaken by the combined efforts of the two men.

"Have to have a battering ram," grunted Frank, casting about for a suitable implement.

"Here you are," called Tommy, after a moment's search. "Just the thing we are looking for."

He had come upon a pile of logs, and one of these, evidently a section of an old telephone pole, was of some ten or twelve inches diameter and about fifteen feet long. Frank pounced upon it eagerly, and, supporting most of the weight himself, led the attack on the heavy oak door with the iron bands.

No sound from within greeted the thunderous poundings. Clearly, if Leland was behind that door, he was either dead or unconscious.

Finally the double lock gave way and Tommy and

Frank were precipitated headlong into the brightly lighted room beyond. Recovering their balance, they took stock of their surroundings and were amazed at what they saw—a huge laboratory, fitted out with every modern appliance that money could buy. A completely equipped machine shop there was; bench after bench covered with the familiar paraphernalia of the chemical and physical laboratory; huge retorts and stills; complicated electrical equipments; dozens of cabinets holding crucibles, flasks, bottles, glass tubing, and what not.

"Good Lord!" gasped Tommy. "Here's a laboratory to more than match our own. Why, Leland's got a fortune invested here!"

"I should say so. And a lot of stuff that our company does not even have. Some of it I don't know even the use of. But where is Leland?"

There was no sign of the man they had come to help. He was not in the laboratory, though the door had been locked from within and the lights left burning throughout.

With painstaking care they searched every nook and cranny of the large single room and were about to give up in despair when Tommy happened to observe an ivory button set into the wall at the only point in the room where there were no machines or benches at hand. Experimentally he pressed the button, and, at the answering rumble from under his feet, jumped back in alarm. Slowly there opened in the paneled oak wall a rectangular door, a door of large enough size to admit a man. From the recess beyond there came a breath of air, foul with the musty odor of decayed vegetation, dank as the air of a tomb.

"Ah-h-h!" breathed Frank. "So that is where Ed Leland is hiding! The secret retreat of the gloomy scientist!"

He spoke half jestingly, yet when he squeezed his stalwart bulk through the opening and flashed the beam of his light into the darkness of a narrow passage ahead he was assailed with vague forebodings. Tommy followed close behind and spoke not a word.

The passage floor was thick with dust, but the marks of many footsteps going and returning gave mute evidence of the frequency of Leland's visits. The air was heavy and oppressive and the temperature and humidity increased as they progressed along the winding length of the rock-walled passageway. The floor sloped, ever downward and, in spots, was slippery with slimy seepage. It seemed that they turned back on their course on several occasions but were descending deeper and deeper into the heart of the mountain. Then, abruptly, the passage ended at the mouth of a shaft, which dropped vertically from almost beneath their feet.

"Whew!" exclaimed Frank. "Another step and I'd have dropped into it. That's probably what happened to Leland."

He knelt at the rim of the circular opening and looked into the depths of the pit, Tommy following suit. The feeble ray of the flashlight was lost in the blackness below.

"Say, Frank," whispered Tommy, "turn off the flash. I

think I saw a light down there."

And, with the snapping of the catch, there came darkness. But, miles below them, it seemed, there was a tiny pin-point of brilliance—an eery green light that was like a wavering phosphorescence of will-o'-the-wisp. For a moment it shone and was gone. Then came the dreadful vibration they had experienced in the hall of the house—the whistling scream that grew louder and louder until it seemed they must be deafened. The penetrating wail rose from the depths of the pit, and the vibration was all around them, in the damp rock floor on which they knelt, and in the very air of the cavern. Hastily Frank snapped on the light of his flash.

"Oh boy!" he whispered. "Leland is certainly up to something down there and no mistake! How're we going to get down?"

"Get down?" asked Tommy. "You don't want to go down there, do you?"

"Sure thing. We're this far now and, by George, we're

going to find out all there is to learn."

"How deep do you suppose it is?"

"Pretty deep, Tommy. But we can get an idea by dropping a stone and counting the seconds until it strikes."

He played the light of the flash over the floor and soon located a smooth round stone of the size of a baseball. This he tossed over the rim of the pit and awaited results.

"Good grief!" exclaimed Tommy. "It's not falling!"

What he said was true, for the stone poised lightly over the opening and drifted like a feather. Then slowly it moved, settling gradually into oblivion. Frank turned the flash downward and they watched in astonishment as the two-pound pebble floated deliberately down the center of the shaft at the rate of not more than one foot in each second.

"Well, I'll be doggoned," breathed Frank admiringly.

"Leland has done it. He has conquered gravity. For, in that pit at least, there is no gravity, or at any rate not enough to mention. It has been almost completely counteracted by some force he has discovered and now we know how to follow him down there. Come on Tommy, let's go!"

And, suiting action to his words, Frank jumped into the mouth of the pit where he bobbed about for a moment as if he had jumped into a pool of water. Then slowly he sank from view, and Tommy followed him.

It was a most unique experience, that drop into the heart of the mountain. Practically weightless, the two young men found it quite difficult to negotiate the passage. For the first hundred or more feet they continued to bump about in the narrow shaft and each sustained painful bruises before he learned that the best and simplest method of accommodating himself to the strange condition was to remain absolutely motionless and allow the greatly weakened gravity to take its course. Each movement of an arm or leg was accompanied by a change in direction of

movement, and contact with the hard stone walls followed. If they endeavored to push themselves from the contact the result was likely to be an even more serious bump on the opposite side of the shaft. So they continued the leisurely drop into the unknown depth of the pit.

Frank had turned off the flashlamp, for its battery was giving out and he wished to conserve its remaining energy for eventualities. Thus they were in Stygian darkness for nearly a half-hour, though the green luminosity far beneath them grew stronger with each passing minute. It now revealed itself as a clearly defined disc of light that flickered and sputtered continually, frequently lighting the lower end of the shaft with an unusual burst of brilliance. Remotely distant it seemed though, and unconscionably slow in drawing nearer.

"How far do you think we must drop?" called Tommy to Frank, who was probably fifty feet below him in the shaft.

"Well, I figure we have fallen about a thousand feet so

far," came the reply, "and my guess is that we are about one third of the way down."

"Then this shaft is over a half-mile deep, you think?"

"Yes, at least a thousand yards, I should say. And I hope his gravity neutralizing machinery doesn't quit all of a sudden and let us down."

"Me, too," called Tommy, who had not thought of that possibility.

This was no joke, this falling into an unknown region so far beneath the surface of good old mother earth, thought Tommy. And how they would ever return was another thing that was not so funny. Frank was always rushing into things like this without counting the possible cost and—well—this might be the last time.

Gradually the mysterious light became stronger and soon they could make out the conformation of the rock walls they were passing at such a snail's pace. Layers of vari-colored rock showed here and there,

and, at one point there was a stratum of gold-bearing or mica-filled rock that glistened with a million reflections and re-reflections. The air grew warmer and more humid as they neared the mysterious light source. They moved steadily, without acceleration, and Frank estimated the rate at about forty feet a minute. Then, with blinding suddenness, the light was immediately below and they drifted into a tremendous cavern that was illuminated by its glow.

Directly beneath the lower end of the shaft through which they had passed, there was a glowing disc of metal about fifteen feet in diameter. They drifted to its surface and sprawled awkwardly where they fell. Scrambling to gain a footing, they bounced and floated about like toy balloons before realizing that it would be necessary to creep slowly from the influence of that repelling force which had made the long drop possible without injury. Gravity met them at the disc's edge with what seemed to be unusual violence.

At first it seemed that their bodies weighed twice the normal amount, but this feeling soon passed and they looked about them with incredulous amazement. The

metal disc was quite evidently the medium through which the repelling force was set up in the shaft, and to this disc was connected a series of heavy cables that led to a pedestal nearby. On the pedestal was a controlling lever and this moved over a quadrant that was graduated in degrees, one end of the quadrant being labeled "Up" and the other "Down." The lever now stood at a point but a very few degrees from the center or "Zero" mark and on the down side. Frank pulled this lever over to the full "Down" position and they found that they could walk over the disc with normal gravity.

"I suppose," said Frank, "that if the lever is at the other end of the scale one would fall upward with full gravity acceleration—reversed. At zero, gravity is exactly neutralized, and the intermediate positions are useful in conveying materials or human beings up and down the shaft as desired. Very clever; but what is the reason for it all?"

In the precise center of the great cavern there was a dome or hemisphere of polished metal, and it was from this dome that the eery light emanated. At times,

when the light died down, this dome gleamed with dull flickerings that threatened to vanish entirely. Then suddenly it would resume full brilliance, and the sight was marvelous beyond description. A slight hissing sound came from the direction of the dome, and this varied in intensity as did the light.

"Gosh!" said Tommy. "That looks like silver to me. And, if it is, what a wealthy man our friend Leland has become. He has spent his fortune well, even if he used it all to get to this."

"Yes, but where is he?" commented Frank. Then: "Leland! Leland!" he called.

His voice echoed through the huge vault and re-echoed hollowly. But there was no reply save renewed flickerings from the dome.

Leaving the vicinity of the gravity disc, the two men advanced in the direction of the shining dome, which was about a quarter-mile from where they stood. Both perspired freely, for the air was very close and the temperature high. But the light of the dome was as

cold as the light of a firefly and they had no hesitancy in drawing near. It was a beautiful sight, this dome of silver with its flickering lights and perfect contour.

"By George, I believe it *is* silver," exclaimed Frank, when they were within a few feet of the dome. "No other metal has that precise color. And look! There is a wheelbarrow and some mining tools. Leland has been cutting away some of the material."

Sure enough, there was indisputable evidence of the truth of his statement. And the material was undoubtedly silver!

"Silver Dome," breathed Tommy, holding a lump of the metal in his hand. "A solid dome of pure silver—fifty feet high and a hundred in diameter. How much does that figure in dollars and cents, Frank?"

"Maybe it isn't solid," said Frank dryly, "though it's worth a sizeable fortune even if it is hollow. And we haven't found Leland."

They circled the dome twice and looked into every

corner of the great cavern, but there was no sign of the man for whom they searched. The wheelbarrow was half filled with lumps of the heavy metal, and maul and drill lay where they had been dropped by the lone miner. A cavity three feet across, and as many deep, appeared in the side of the dome to show that considerably more than one wheelbarrow load had been removed.

"Funny," grunted Tommy. "Seems almost like the old dome had swallowed him up."

At his words there came the terrific vibration. The light of the dome died out, leaving them in utter darkness, and from its interior there rose the mounting scream that had frightened old Thomas away. From so close by it was hideous, devastating; and the two men clung to each other in fright, expecting momentarily that the earth would give way beneath their feet and precipitate them into some terrible depth from which there could be no return.

Then the sound abruptly ceased and a gleam of light came from under the dome of silver. A crack appeared

between its lower edge and the rocky floor of the cavern, and through this crack there shone a light of dazzling brilliancy—a warm light of rosy hue. Wider grew the opening until there was a full three feet between the floor and the bottom of the dome.

Impelled by some irresistible force from within, the two men stumbled blindly to the opening, fell to the floor and rolled inside.

There was a heavy thud and the dome had returned to its normal position, with Frank and Tommy prisoners within its spacious hollow. The warm light bathed them with fearful intensity for a moment, then faded to a rosy glow that dulled their senses and quieted their nerves. Morpheus claimed them.

When Frank awoke he found himself between silken covers, and for a moment he gazed thoughtfully at a high arched ceiling that was entirely unfamiliar. Then, remembering, he sprang from the downy bed to his feet. The room, the furnishings, his silken robe, everything was strange. His bed, he saw, was a high one, and the frame was of the same gleaming silver as the dome under which they had been trapped. The

arched ceiling glowed softly with the same rosy hue as had the inner surface of the dome. A large pool of water invited him, the surface of the pool being no more than a foot below the point where it was built into the tile floor of the room. A large open doorway connected with a similar adjoining room, where he suspected Tommy had been taken. On his bare toes, he moved silently to the other room and saw that his guess had been correct. Tommy lay sleeping quietly beneath covers as soft as his own and amidst equal luxury of surroundings.

"Well," he whispered, "this doesn't look as though we would come to any harm. And I might as well take a dive in that pool."

Returning to his own room, he removed the silken garment with which he had been provided and was quietly immersed in the cool, invigorating water of the bath. His head cleared instantly.

"Hi there!" called Tommy from the doorway. "Why didn't you wake me up? Where are we, anyway?"

With dripping head and shoulders above the water, Frank was compelled to laugh at the sleepy-eyed, wondering expression on the blue-jowled face of his friend. "Thought you were dead to the world," he returned, "you old sleepy-head. And I don't know where we are, excepting that it is somewhere under the silver dome. What's more, I don't much care. You should get into this water. It's great!"

So saying, he dived to the bottom of the pool and stood on his hands, his feet waving ludicrously above the surface. Tommy sniffed once and then made a quick dash for the pool in his own room. He was not to be outdone by his more energetic partner.

A half-hour later, shaved and attired in their own garments, which had been cleaned and pressed and hung neatly in the closets, they settled themselves for a discussion of the situation. Having tried the doors of both rooms and found them locked from the outside, there was no other course open to them. They must await developments.

"Looks like Leland has quite an establishment down

here inside the mountain," ventured Tommy.

"Hm!" snorted Frank, "this place is none of Leland's work. He is probably a prisoner here, as are we. He just stumbled on to the silver dome and was captured by whatever race is living down here beneath it, the same as we were. Who the real inhabitants are, and what the purpose of all this is, remains to be seen."

"You think we are in friendly hands?"

"These quarters do not look much like prison cells, Tommy, but I must admit that we are locked in.

Anyhow, I'm not worrying, and we will soon learn our fate and have to be ready to meet it. The people who own this place must have everything they want, and they sure have some scientific knowledge that is not known to us on the surface."

"Wonder if they are humans?"

"Certainly they are. You never heard of wild beasts sleeping in beds like these, did you?"

Tommy laughed at he examined the exquisite hand-wrought figures on the silver bedstead. "No, I didn't," he admitted; "but where on earth did they come from, and what are they doing here?"

"You ask too many questions," replied Frank, shrugging his broad shoulders. "We must simply wait for the answers to reveal themselves."

There was a soft rap at the door of Frank's room, where the two men were talking.

"Come in," called Frank, chuckling at the idea of such consideration from their captors.

A key rattled in the lock and the door swung open to admit the handsomest man they had ever set eyes on. He was taller than Frank by several inches, standing no less than six feet five in his thin-soled sandals, and he carried himself with the air for an emperor. His marble-white body was uncovered with the exception of a loin cloth of silver hue, and lithe muscles rippled beneath his smooth skin as he advanced to meet the prisoners. His head, surmounted by curly hair of ebon

darkness, was large, and his forehead high. The features were classic and perfectly regular. The corners of his mouth drew upward in a benign smile.

"Greetings," he said, in perfect English and in a soft voice, "to the domain of Theros. You need fear no harm from our people and will be returned to the upper world when the time comes. We hope to make your stay with us enjoyable and instructive, and that you will carry back kind memories of us. The morning meal awaits you now."

So taken aback were the two young Americans that they stared foolishly agape for a space. Then a tinkling laugh from the tall stranger set them once more at ease.

"You will pardon us, I hope," apologized Frank, "but this is all so unexpected and so unbelievable that your words struck me speechless. And I know that my friend was similarly affected—We place ourselves in your hands."

The handsome giant nodded understanding. "No

offense was taken," he murmured, "since none was intended. And your feelings are not to be wondered at. You may call me Orrin."

He turned toward the open door and signified that they were to follow him. They fell in at his side with alacrity, both suddenly realizing that they were very hungry.

They followed in silent wonderment as Orrin led the way to a broad balcony that overlooked a great underground city—a city lighted by the soft glow from some vast lighting system incorporated in its vaulted ceiling high overhead. The balcony was many levels above the streets, which were alive with active beings of similar appearance to Orrin, these speeding hither and yon by means of the many lanes of traveling ways of which the streets were composed. The buildings—endless rows of them lining the orderly streets—were octagonal in shape and rose to the height of about twenty stories, as nearly as could be judged by earthly standards. There were no windows, but at about every fifth floor there was an outer silver-railed balcony similar to the one on which they walked. The

air was filled with bowl-shaped flying ships that sped over the roof tops in endless procession and without visible means of support or propulsion. Yet the general effect of the busy scene was one of precise orderliness, unmarred by confusion or distracting noises.

Orrin vouchsafed no explanations and they soon reentered the large building of which the balcony was a part. Here they were conducted to a sumptuously furnished dining room where their breakfast awaited them.

During the meal, which consisted of several courses of fruits and cereals entirely strange to Frank and Tommy, they were tended by Orrin with the utmost deference and most painstaking attention. He anticipated their every want and their thoughts as well. For, when Frank endeavored to ask one of the many questions with which his mind was filled, he was interrupted by a wave of the hand and a smile from their placid host.

"It is quite clear to me that you have many questions

to propound," said Orrin, "and this is not a matter of wonder. But it is not permitted that I enlighten you on the points you have in mind. You must first finish your meal. Then it is to be my privilege to conduct you to the presence of Phaestra, Empress of Theros, who will reveal all. May I ask that you be patient until then?"

So friendly was his smile and so polished his manner that they restrained their impatience and finished the excellent breakfast in polite silence.

And Orrin was as good as his word, for, no sooner had they finished when he led them from the room and showed the way to the elevator which conveyed them to the upper floor of the building.

From the silver-grilled cage of the lift they stepped into a room of such beauty and magnificence of decoration that they gazed about them in wondering admiration. The paneling and mouldings were of hammered silver that gleamed with polished splendor in the soft rose glow of the hidden lights. The hangings were of heavy plush of deep green hue and bore intricate designs of silver thread woven into the

material. At the opposite side of the room there was a pair of huge double doors of chased silver and on either side of this pretentious portal there stood an attendant attired as was Orrin, but bearing a silver scepter to denote his official capacity.

"Phaestra awaits the visitors from above," intoned one of the attendants. Both bowed stiffly from the waist when Orrin led the two young scientists through the great doors which had opened silently and majestically at their approach.

If the outer room was astonishing in its sumptuousness of decoration and furnishing, the one they now entered was positively breath-taking. On every side there were the exquisite green and silver hangings. Tables, divans, and rugs of priceless design and workmanship. But the beauty of the surroundings faded into insignificance when they saw the empress.

A canopied dais in the center of the room drew their attention and they saw that Phaestra had risen from her seat in a deeply cushioned divan and now stood at its side in an attitude of welcome. Nearly as tall as

Frank, she was a figure of commanding and imperious beauty. The whiteness of her body was accentuated by the silver embroidered and tightly fitted black vestments that covered yet did not conceal its charms. A halo of glorious golden hair surmounted a head that was poised expectantly alert above the perfectly rounded shoulders. The exquisite oval of her face was chiseled in features of transcendent loveliness. She spoke, and, at sound of her musical voice, Frank and Tommy were enslaved.

“Gentlemen of the upper world,” she said gently, “you are welcome to Theros. Your innermost thoughts have been recorded by our scientists and found good. With a definite purpose in mind, you learned of the existence of the silver dome of Theros, yet you came without greed or malice and we have taken you in to enlighten you on the many questions that are in your minds and to return you to mankind with a knowledge of Theros—which you must keep secret. You are about to delve into a mystery of the ages; to see and learn many things that are beyond the ken of your kind. It is a privilege never before accorded to beings from

above."

"We thank you, oh, Queen," spoke Frank humbly, his eyes rivetted to the gaze of those violet orbs that seemed to see into his very soul. Tommy mumbled some commonplace.

"Orrin—the sphere!" Phaestra, slightly embarrassed by Frank's stare, clapped her hands.

At her command, Orrin, who had stood quietly by, stepped to the wall and manipulated some mechanism that was hidden by the hangings. There was a musical purr from beneath the floor, and, through a circular opening which appeared as if by magic, there rose a crystal sphere of some four feet in diameter. Slowly it rose until it reached the level of their eyes and there it came to rest. The empress raised her hands as if in invocation and the soft glow of the lights died down, leaving them in momentary darkness. There came a slight murmur from the sphere, and it lighted with the eery green flickerings they had observed in the dome of silver.

Fascinated by the weaving lights within, they gazed into the depths of the crystal with awed expectancy. Phaestra spoke.

"Men from the surface," she said, "you, Frank Rowley, and you, Arnold Thompson, are about to witness the powers of that hemisphere of metal you were pleased to term 'Silver Dome.' As you rightly surmised, the dome is of silver—mostly. There are small percentages of platinum, iridium, and other elements, but it is more than nine-tenths pure silver. To you of the surface the alloy is highly valuable for its intrinsic worth by your own standards, but to us the value of the dome lies in its function in revealing to us the past and present events of our universe. The dome is the 'eye' of a complicated apparatus which enables us to see and hear any desired happening on the surface of the earth, beneath its surface, or on the many inhabited planets of the heavens. This is accomplished by means of extremely complex vibrations radiated from the hemisphere, these vibrations penetrating earth, metals, buildings, space itself, and returning to our viewing and sound

reproducing spheres to reveal the desired past or present occurrences at the point at which the rays of vibrations are directed.

"In order to view the past on our own planet, the rays, which travel at the speed of light, are sent out in a huge circle through space, returning to earth after having spent the requisite number of years in transit. Instantaneous effect is secured by a connecting beam that ties together the ends of the enormous arc. This, of course, is beyond your comprehension, since the Ninth Dimension is involved. When it is desired that events of the present be observed, the rays are projected direct. The future can not be viewed, since, in order to accomplish this, it would be necessary that the rays travel at a speed greater than that of light, which is manifestly impossible."

"Great guns!" gasped Frank. "This crystal sphere then, is capable of bringing to our eyes and ears the happenings of centuries past?"

"It is, my dear Frank," said Phaestra, "and I would that I were able to describe the process more clearly."

She smiled, and in the unearthly light of the sphere she appeared more beautiful than before, if such a thing were possible.

On the pedestal which supported the sphere there was a glittering array of dials and levers. Several of these controls were now adjusted by Phaestra, the delicate motions of her tapered fingers being watched by the visitors with intense admiration. There came a change in the note of the sphere, a steadying of the flickerings within.

"Behold!" exclaimed Phaestra.

They gazed into the depths of the sphere and lost all sense of detachment from the scene depicted therein. It seemed they were at a point several thousand miles from the surface of a planet. A great continent spread beneath them, its irregular shore line being clearly outlined against a large body of water. Here and there the surface was obscured by great white patches of clouds that cast their shadows below.

"Atlantis!" breathed Phaestra reverently.

The lost continent of mythology! The fabled body of land that was engulfed by the Atlantic thousands of years ago—a fact!

Tommy glanced at Frank, noting that he had withdrawn his gaze from the sphere and was devouring Phaestra with his eyes. As if drawn by the ardor of his observation, she raised her own eyes from the sphere to meet those of the handsome visitor. Obviously confused, she dropped her long lashes and turned nervously to the controls. Tommy experienced a sudden feeling of dread. Surely his pal was not falling in love with this Theronian empress!

Then there came another change in the note of the sphere and once more they lost themselves in contemplation of the scene within. The surface of the lost continent was rushing madly to meet them. With terrific velocity they seemed to be falling. An involuntary gasp was forced from Tommy's lips. Mountains, valleys, rivers could now be discerned.

Then the scene shifted slightly and they were stationary, directly above a large seacoast city. A city

of great beauty it was, and its buildings were of the same octagonal shape as were those of Theros! There could be but one inference—the Theronians were direct descendants of those inhabitants of ancient Atlantis.

"Yes," sighed Phaestra, in answer to the thought she had read, "our ancestors were those you now see in the streets of this city of Atlantis. A marvelous race they were, too. When the rest of the world was still savage and unenlightened, they knew more of the arts and sciences than is known on the surface to-day. The mysteries of the Fourth Dimension they had already solved. Their telescopes were of such power that they knew of the existence of intelligent beings on Mars and Venus. They had conquered the air. They knew of the relation between gravity and magnetism but recently propounded by your Einstein. They were prosperous, happy. Then—but watch!"

Faint sounds of the life of the city came to their ears. A swarm of monoplanes roared past just beneath them. The streets were crowded with rapidly moving vehicles, the roof-tops with air-craft. Then suddenly

the scene darkened; a deep rumbling came from the sea. As they watched in fascinated wonder, a great chasm opened up through the heart of the city. Tall buildings swayed and crumbled, falling into heaps of twisted metal and crushed masonry and burying hundreds of the populace in their fall. The confusion was indescribable, the uproar terrific, and within the space of a very few minutes the entire city was a mass of ruins, fully half of the wrecked area having been swallowed up by the heaving waters of the ocean.

Phaestra stifled a sob. "Thus it began," she stated. "Trovus was first—the city you just saw—then came three more of the cities of the western coast in rapid succession. Computations of the scientists showed that the upheaval was widespread and that the entire continent was to be engulfed in a very short time. The exodus began, but it was too late, and only a few hundred people were able to escape the continent before it was finally destroyed. The ocean became the tomb of two hundred millions. The handful of survivors reached the coast of what is now North America. But the rigors of the climate proved severe

and more than three-quarters of them perished within a few days after their planes landed. Then the rest took to the caves along the shore, and for a while were safe."

She manipulated the controls once more and there was a quick shift to another coast, a rugged, wave-beaten shore. Closer they drew until they observed a lofty palisade that extended for miles along the barren waterfront. They saw a fire atop this elevation and active men and women at various tasks within the narrow circle of its warmth. A cave mouth opened at the brink of the precipice near the spot they occupied.

Then came a repetition of the upheaval at Trovus. The ocean rushed in and beat against the cliff with such ferocity that its spray was tossed hundreds of feet in the air. The earth shook and the group of people around the fire made a hasty retreat to the mouth of the cave. The sky darkened and the winds howled with demoniac fury. Quake after quake rent the rugged cliffs: huge sections toppled into the angry waters. Then a great tidal wave swept in and covered everything, cliffs, cave mouths and all. Nought

remained where they had been but the seething waters.

"But some escaped!" exulted Phaestra, "and these discovered Theros. Though many miles of the eastern seaboard of your United States were submerged and the coastline entirely altered, these few were saved. Their cave connected with a long passage, a tunnel that led into the bowels of the earth. With the outer entrance blocked by the upheaval they had no alternative save to continue downward."

"They traveled for days and days. Some were overcome by hunger and fell by the wayside. The most hardy survived to reach Theros, a series of enormous caverns that extends for hundreds of miles under the surface of your country. Here they found subterranean lakes of pure water; forests, game. They had a few tools and weapons and they established themselves in this underground world. From that small beginning came this!"

Phaestra's slim fingers worked rapidly at the controls. The scenes shifted in quick succession. They were

once more in the present, and seemed to be traveling speedily through the underground reaches of Theros. Now they were racing through a long lighted passage; now over a great city similar to the one in which they had arrived. Here they visited a huge workshop or laboratory; there a mine where radium or cobalt or platinum was being wrested from the vitals of the unwilling earth. Then they visited a typical Theronian household, saw the perfect peace and happiness in which the family lived. Again they were in a large power plant where direct application of the internal heat of the earth as obtained through deep shafts bored into the interior was utilized in generating electricity.

They saw vast quantities of supplies, fifty-ton masses of machinery, moved from place to place as lightly as feathers by use of the gravity discs, those heavily charged plates whose emanations counteracted the earth's attraction. In one busy laboratory they saw an immense television apparatus and heard scientists discussing moot questions with inhabitants of Venus, whose images were depicted on the screen. They

witnessed a severe electrical storm in the huge cavern arch over one of the cities, a storm that condensed moisture from the artificially oxygenated and humidified atmosphere in such blinding sheets as to easily explain the necessity for well-roofed buildings in the underground realm. And, in all the speech and activities of the Theronians, there was evident that all-pervading feeling of absolute contentment and freedom from care.

"What I can not understand," said Frank, during a quiet interval, "is why the Theronians have never migrated to the surface. Surely, with all your command of science and mechanics, that would be easy."

"Why? Why?" Phaestra's voice spoke volumes. "Here—I'll show you the reason."

And again the scene in the sphere changed. They were on the surface and a few years in the past—at Chateau Thierry. They saw their fellow men mangled and broken; saw human beings shot down by hundreds in withering bursts of machine-gun fire; saw

them in hand-to-hand bayonet fights; gassed and in delirium from the horror of it all.

They traveled over the ocean; saw a big passenger liner the victim of torpedo fire; saw babies tossed into the water by distracted mothers who jumped in after them to join them in death.

A few years were passed by and they saw gang wars in Chicago and New York; saw militia and picketing strikers in mortal combat; saw wealthy brokers and bank presidents turn pistols on themselves following a crash in the stock market; government officials serving penitentiary terms for betrayal of the people's trust; opium dens, speakeasies, sex crimes. It was a fearful indictment.

"Ah, no," said Phaestra kindly, "the surface world has not yet emerged from savagery. We should be unwelcome were we to venture outside. And now we come to the reason for your visit. You come in search of one Edwin Leland, a fellow worker at one time. Your motives are above reproach. But Leland came as a greedy searcher of riches. We brought him within to

teach him the error of his ways and to beg him to desist from his efforts at destroying the dome of silver. He alone knew the secret."

"Then you followed him and we took you in for similar reasons, though our scientists found very quickly that your mental reactions were of entirely different type from Leland's and that the secret would be safe in your keeping. Leland remains obdurate. He threatens us with physical violence, and his reactions to the thought-reading machines are of the most treacherous sort. We must keep him with us. He shall remain unharmed, but he must not be allowed to return. That is the story. You two are free to leave when you choose. I ask not that you give your word to keep the secret of 'Silver Dome.' I know it is not necessary."

The lights had resumed their normal glow, and the marvelous sphere returned to its receptacle beneath the floor. Phaestra resumed her seat on the canopied divan. Frank dropped to a seat on the edge of the dais. Tommy and Orrin remained standing, Tommy lost in thought and Orrin stolidly mute. The empress

avoided Frank's gaze studiously. Her cheeks were flushed; her eyes bright with emotion.

Frank was first to break the silence. "Leland is in solitary confinement?" he asked.

"For the present he is under guard," replied Phaestra. "He was quite violent and it was necessary to disarm him after he had killed one of my attendants with a shot from his automatic pistol. When he agrees to submit peacefully, he shall be given the freedom of Theros for the remainder of his life."

"Perhaps," suggested Frank, "if I spoke to him...."

"The very thing." Phaestra thanked him with her wondrous eyes.

A high pitched note rang out from behind the hangings, and, in rapid syllables of the language of Theros, a voice broke forth from the concealed amplifiers. Orrin, startled from his stoicism, sprang to the side of his empress. She rose from her seat as the voice completed its excited message.

"It is Leland," she said calmly. "He has escaped and recovered his pistol. I have been told that he is now at large in the palace, terrorizing the household. We have no weapons here, you see."

"Good God!" shouted Frank. "Suppose he should come here?"

He jumped to his feet just as a shot rang out in the antechamber. Orrin dashed to the portal when a second shot spat forth from the automatic which must certainly be in the hands of a madman. The doors swung wide and Leland, hair disarranged and bloodshot eyes staring, burst into the room. Orrin went down at the next shot and the hardly recognizable scientist advanced toward the dais.

When he saw Frank and Tommy he stopped in his tracks. "So you two have been following me!" he snarled. "Well, you won't keep me from my purpose. I'm here to kill this queen of hell!"

Once more he raised his automatic, but Frank had been watching closely and he literally dove from the

steps of the dais to the knees of the deranged Leland. As beautiful a tackle as he had ever made in his college football days laid the maniac low with a crashing thud that told of a fractured skull. The bullet intended for Phaestra went wide, striking Tommy in the shoulder.

Spun half way around by the impact of the heavy bullet, Tommy fought to retain his balance. But his knees went suddenly awry and gave way beneath him. He crumpled helplessly to the floor, staring foolishly at the prostrate figure of Leland and at Frank, who had risen to his feet and now faced the beautiful empress of Theros. Strange lights danced before Tommy's eyes, and he found it difficult to keep the pair in focus. But he was sure of one thing—his pal was unharmed. Then the two figures seemed to merge into one and he blinked his eyes rapidly to clear his failing vision. By George, they were in each other's arms! Funny world—above or below—it didn't seem to make any difference. But it was a tough break for Frank—morganatic marriage and all that. No chance—well—

Tommy succumbed to his overpowering drowsiness.

The awakening was slow, but not painful. Rather there was a feeling of utter contentment, of joy at being alive. A delicious languor pervaded Tommy's being as he turned his head on a snow white silken pillow and stared at the figure of the white-capped nurse who was fussing with the bottles and instruments that lay on an enameled table beside the bed. Memory came to him immediately. He felt remarkably well and refreshed. Experimentally he moved his left shoulder. There was absolutely no pain and it felt perfectly normal. He sat erect in his surprise and felt the shoulder with his right hand. There was no bandage, no wound. Had he dreamed of the hammer blow of that forty-five caliber bullet?

His nurse, observing that her patient had recovered consciousness, broke forth in a torrent of unintelligible Theronian, then rushed from the room.

He was still examining his unscarred shoulder in wonder, when the nurse returned, with Frank Rowley at her heels. Frank laughed at the expression of his

friend's face.

"What's wrong, old-timer?" he asked.

"Why—I—thought that fool of a Leland had shot me in the shoulder," stammered Tommy, "but I guess I dreamed it. Where are we? Still in Theros?"

"We are." Frank sobered instantly, and Tommy noted with alarm that his usually cheerful features were haggard and drawn and his eyes hollow from loss of sleep. "And you didn't dream that Leland shot you. That shoulder of yours was mangled and torn beyond belief. He was using soft nosed bullets, the hell-hound!"

"Then how—?"

"Tommy, these Theronians are marvelous. We rushed you to this hospital and a half-dozen doctors started working on you at once. They repaired the shattered bones by an instantaneous grafting process, tied the severed veins and arteries and closed the gaping wound by filling it with a plastic compound and

drawing the edges together with clamps. You were anaesthetized and some ray machine was used to heal the shoulder. This required but ten hours and they now say that your arm is as good as ever. How does it feel?"

"Perfectly natural. In fact I feel better than I have in a month." Tommy observed that the nurse had left the room and he jumped from his bed and capered like a school boy.

This drew no sign of merriment from Frank, and Tommy scrutinized him once more in consternation. "And you," he said, "what is wrong with you?"

"Don't worry about me," replied Frank impatiently. Then, irrelevantly, he said "Leland's dead."

"Should be. I knew we shouldn't have started out to help him. But, Frank, I'm concerned about you. You look badly." Tommy was getting into his clothes as he spoke.

"Forget it, Tommy. You've been sleeping for two days,

you know—part of the cure—and I haven't had much rest during that time. That is all."

"It's that Phaestra woman," Tommy accused him.

"Well, perhaps. But I'll get over it, I suppose. Tommy, I love her. But there's no chance for me. Haven't seen her since the row in the palace. Her council surrounds her continually and I have been advised to-day that we are to be returned as quickly as you are up and around. That means immediately now."

"Good. The sooner the better. And you just forget about this queen as soon as you are able. She's a peach, of course, but not for you. There's lots more back in little old New York." But Frank had no reply to this sally.

There came a knock at the door and Tommy called, "Come in."

"I see you have fully recovered," said the smiling Theronian who entered at the bidding, "and we are overjoyed to know this. You have the gratitude of the

entire realm for your part in the saving of our empress from the bullets of the madman."

"I?"

"Yes. You and your friend. And now, may I ask, are you ready to return to your own land?"

Tommy stared. "Sure thing," he said, "or rather, I will be in a few minutes."

"Thank you. We shall await you in the transmitting room." The Theronian bowed and was gone.

"Well, I like that," said Tommy. "He hands me an undeserved compliment and then asks how soon we can beat it. A 'here's your hat, what's your hurry' sort of thing."

"It's me they're anxious to be rid of," remarked Frank, shrugging his broad shoulders, "and perhaps it is just as well."

"You bet it is!" agreed Tommy enthusiastically, "and

I'm in favor of making it good and snappy." He completed his toilet as rapidly as possible and then turned to face the down-hearted Frank.

"How do we go? The way we came?" he asked.

"No, Tommy. They have closed off the shaft that led from the cavern of the silver dome. They are taking no more chances. It seems that the shaft down which we floated was constructed by the Theronians; not by Leland. They had used it and the gravity disc to transport casual visitors to the surface, who occasionally mixed with our people in order to learn the languages of the upper world and to actually touch and handle the things they were otherwise able to see only through the medium of Silver Dome and the crystal spheres. Further visits to the surface are now forbidden, and we are to be returned by a remarkable process of beam transmission of our disintegrated bodies."

"Disintegrated?"

"Yes. It seems they have learned to dissociate the

atoms of which the human body is composed and to transmit them to any desired point over a beam of etheric vibrations, then to reassemble them in the original living condition."

"What? You mean to say we are to be shot to the surface through the intervening rock and earth? Disintegrated and reintegrated? And we'll not even be bent, let alone busted?"

This time he was rewarded by a laugh. "That's right. And I have gone through the calculations with one of the Theronian engineers and can find no flaw in the scheme. We're safe in their hands."

"If you say so, Frank, it's okay with me. Let's go!"

Reluctantly his friend lifted his athletic bulk from the chair. In silence he led the way to the transmitting room of the Theronian scientists.

Here they were greeted by two savants with whom Frank was already acquainted, Clarux and Rhonus by name. A bewildering array of complex mechanisms

was crowded into the high-ceilinged chamber and, prominent among them, was one of the crystal spheres, this one of somewhat smaller size than the one in the palace of Phaestra.

"Where do you wish to arrive?" asked Clarux.

"As near to my automobile as possible," replied Frank, taking sudden interest in the proceedings. "It is parked in the lane between Leland's house and the road."

Tommy looked quickly in his direction, encouraged by the apparent change in his attitude. The scientists proceeded to energize the crystal sphere. They were bent upon speeding the parting guests. Their beloved empress was to be saved from her own emotions.

Quick adjustments of the controls resulted in the locating of Frank's car, which was still buried to its axles in snow. The scene included Leland's house, or rather its site, for it appeared to have been utterly demolished by some explosion within.

Tommy raised questioning eyebrows.

"It was necessary," explained Rhonus, "to destroy the house in obliterating all traces of our former means of egress. It has been commanded that you two be returned safely, and we are authorized to trust implicitly in your future silence regarding the existence of Theros. This is satisfactory, I presume?"

Both Tommy and Frank nodded agreement.

"Are you ready, gentlemen?" asked Clarux, who was adjusting a mechanism that resembled a huge radio transmitter. Its twelve giant vacuum tubes glowed into life as he spoke.

"We are," chimed the two visitors.

They were requested to step to a small circular platform that was raised about a foot from the floor by means of insulating legs. Above the table there was an inverted bowl of silver in the shape of a large parabolic reflector.

"There will be no alarming sensations," averred Clarux. "When I close the switch the disintegrating energy from the reflector above will bathe your bodies for a moment in visible rays of a deep purple hue. You may possibly experience a slight momentary feeling of nausea. Then—presto!—you have arrived."

"Shoot!" growled Frank from his position on the stand.

Clarux pulled the switch and there was a murmur as of distant thunder. Tommy blinked involuntarily in the brilliant purple glow that surrounded him. Then all was confusion in the transmitting room. Somebody had rushed through the open door shouting, "Frank! Frank!" It was the empress Phaestra.

In a growing daze Tommy saw her dash to the platform, seize Frank in a clutch of desperation. There was a violent wrench as if some monster were twisting at his vitals. He closed his eyes against the blinding light, then realized that utter silence had followed the erstwhile confusion. He sat in Frank's car—alone.

The journey was over, and Frank was left behind. With awful finality it came to him that there was nothing he could do. It was clear that Phaestra had wanted his pal, needed him—come for him. From the fact that Frank remained behind it was evident that she had succeeded in retaining him. A sickening fear came to Tommy that she had been too late; that Frank's body was already partly disintegrated and that he might have paid the price of her love with his life. But a little reflection convinced him that if this were the case a portion of his friend's body would have reached the intended destination. Then, unexplainably, he received a mental message that all was well.

Considerably heartened, he pressed the starter button and the cold motor of Frank's coupe turned over slowly, protestingly. Finally it coughed a few times, and, after considerable coaxing by use of the choke, ran smoothly. He proceeded to back carefully through the drifts toward the road, casting an occasional regretful glance in the direction of the demolished mansion.

He would have some explaining to do when he returned to New York. Perhaps—yes, almost certainly, he would be questioned by the police regarding Frank's disappearance. But he would never betray the trust of Phaestra. Who indeed would believe him if he told the story? Instead, he would concoct a weird fabrication regarding an explosion in Leland's laboratory, of his own miraculous escape. They could not hold him, could not accuse him of murder without producing a body—the *corpus delicti*, or whatever they called it.

Anyway, Frank was content. So was Phaestra.

Tommy swung the heavy car into the road and turned toward New York, alone and lonely—but somehow happy; happy for his friend.

#45 The Flying City, By Harold Thompson Rich

From space came Cor's disc-city of Vada—its mighty,
age-old engines weakening— its horde of dwarfs
hungry for the Earth!

fizzled like moths

In the burning solitude of the great Arizona desert, some two miles south of Ajo, a young scientist was about to perform an experiment that might have far-reaching results for humanity.

The scientist was Gordon Kendrick—a tall, tanned, robust chap who looked more like a prospector in search of gold than a professor of physics from the State University of Tucson.

Indeed, he was in a way, a prospector, since it was gold he sought—some practical method of tapping the vast radio-energetic treasure of the sun—and it was an apparatus designed to accomplish just this that he was about to test.

The primary unit of the mechanism comprised a spheroidal vacuum-tube measuring a little over a foot across its long axis, mounted in a steel bracket that held it horizontal with the ground. Down through its short axis ran a shaft on which was centered a light cross of aluminum wire, carrying four vanes of mica, one face of each coated with lampblack. A flexible cable led from the bottom of this shaft to the base of the bracket, where it was geared to a small electric motor driven by two dry cells. A rheostat-switch for delivering and controlling the current was mounted nearby.

At the wide arc of the egg-shaped tube was a concave platinum cathode, at the narrow arc a nib of some sort, ending in a socket. From this socket, two heavy insulated wires extended sixty feet or so across the sand to the secondary unit of the mechanism, which was roughly a series of resistance coils, resembling those in an ordinary electric heater.

As Kendrick prepared to test this delicate apparatus that represented so much of his time and thought, held so much of his hope locked up in it, a turmoil

was in his heart, though his brown face was calm.

If his theories were right, that revolving cross would tap and draw into its vanes radio-energetic waves of force, much as the whirling armature of a dynamo draws into its coils electro-magnetic waves of force. For the blackened sides of the vanes, absorbing more radiation than the bright sides, would cause the molecules to rebound from the warmer surfaces with greater velocity, setting up an alternate pressure and bringing the rays to a focus on the cathode, where they would be reflected to the nib as waves of *heatricity*, to use the word he had coined.

Those were Kendrick's theories, and now he moved to put them to the supreme test. Switching on the current, he set the motor going. In response, the cross began to revolve, slowly at first—then faster, faster, as he opened the rheostat wider.

Eyes fixed on his resistance coils, he gave a sudden cry of triumph. Yes, there was no doubt about it! They were growing red, glowing brightly, whitely, above the intense desert sunlight.

Here was a means of convening solar radiation into heat, then, that offered tremendous commercial possibilities!

But even as he exulted, there came a blinding flash—and the overtaxed coils burst into flame.

Shielding his eyes from the glare, he reached for the rheostat, shut off the current, rushed to his secondary unit—where he beheld an amazing sight. Not only had this part of the apparatus completely disintegrated, but the sand of the desert floor under it as well. On the spot quivered a miniature lake of molten glass!

As Kendrick stood ruefully beside that fiery pool, meditating on the spectacular but not altogether gratifying results of his experiment, a peculiar low humming sound reached his ears. Rushing back to his primary unit, with the thought that perhaps by some chance he had not fully closed the rheostat, he looked at the cross. But no, the vanes were still.

The humming increased, however—grew into a vibration that made his eardrums ache.

Puzzled, he looked around. What on earth could it be? Had his unruly experiment called into play some tremendous, unsuspected force of the universe. Was he to bring the world to ruin, as a result of his blind groping after this new giant of power?

Such predictions had often been made by the ignorant, to be dismissed by scientists as the veriest nonsense. But was there some truth in the universal fear, after all? Was he to be the Prometheus who stole fire from Olympus, the Samson who toppled down the temple?

Chilled, dizzyed with the pain of the ever-increasing vibration, he gritted his teeth, awaiting he knew not what.

Then it came—a spectacle so staggering that he went rigid with awe as he regarded it, all power of motion utterly numbed for the moment. The vibration ceased. The thing appeared.

It was a city—a city in the air—a flying city!

As Kendrick stood staring at this phenomenon, he could scarcely credit his senses.

Had the magic carpet of Bagdad suddenly materialized before him, he would not have been more astounded. And indeed, it was in a way a magic carpet—a great disclike affair, several miles in diameter, its myriad towers and spires glinting like gold under the noonday sun, while its vast shadow fell athwart the desert like the pall of an eclipse.

The lower portion, he noted, was in the main flat, though a number of wartish protuberances jutted down from it, ejecting a pale violet emanation. Whatever this was it seemed to have the effect of holding the thing motionless in the air, for it hovered there quite easily, a hundred yards or so above the ground.

But what was it? Where was it from? What had brought it?

Those were the questions he wanted answered; and they were to be, sooner than he knew.

As he stood there speculating, a device like a trap-door opened in the base of the disc, and creatures resembling human beings began descending. Began floating down, rather.

Whereupon Kendrick did what any sensible man would have done, under similar circumstances. He reacted into motion. In short, he ran.

Glancing back over his shoulder after a minute or two, however, he drew up sheepishly. Of that strange apparition and those who had descended from it there was not a trace, not a shadow!

But the peculiar humming had recommenced, he realized in the next breath—and at the same instant he felt himself seized by invisible hands.

There was a struggle, but it was brief and futile. When it was over his captors became visible once more. They were singular little beings about four feet

tall, with strange, wise, leathery faces, their heads grotesquely bald.

The humming had ceased again. The disc, too, was once more visible.

What happened next was something even more astounding, if there could be any further degrees of wonder possible for the utterly baffled young scientist. He felt himself lifted up, leaving the desert floor, whirling away toward that incredible phenomenon hovering there.

Another moment or two and he had been borne up through its trap-door opening, was standing in a dark space bounded by solid metal walls. Then he was thrust into a cylinder with several of his tiny guards, shot swiftly upward.

A door opened as they came to rest, and he was led out into a vast court of gleaming amber crystal. Something like a taxi slid up, with iridescent planes, and he was bundled into it, whirled away again.

Down broad, gleaming avenues they passed, where similar traffic flowed densely, but under marvelous control. Towering skyscrapers loomed to right and left. Tier on tier of upper and lower boulevards revealed themselves, all crowded with automotive and pedestrian activity.

At length a stupendous concourse was reached. Thousands of these taxis and similar vehicles were parked along its broad flanks, while literal swarms of diminutive individuals circulated to and fro.

Assisted from the vehicle that had brought him to this obvious center of the disc's activities. Kendrick was led into a monumental structure of jade-green stone that towered a full hundred, stories above the street level. There he was escorted into another of those projectilelike elevators, shot up, up—till at length it came to rest. The door opened and he was led out into a small lobby of the same amber crystal he had observed before.

By now his guards had diminished to two, but he no longer made any effort to escape. Wherever this

amazing adventure might lead, he was resolved to follow it through.

One of the guards had advanced to a jewelled door and was pressing a button. In response, the door opened. A golden-robed, regal creature stood there.

Though dwarfed to four feet, like his fellow, he was obviously their mental superior to a prodigious degree. Not only was his symmetrical bald head of large brain content, but the finely-cut features of his parchment face bore the unmistakable stamp of a powerful intellect.

"*Ao-cha!*" commanded this evident monarch of the disc, addressing the guards.

They bowed and departed, abruptly.

"My dear Kendrick!" the regal personage now said, in thin, precise English. "It is indeed a pleasure to welcome you to my humble quarters. Pray enter and make yourself comfortable."

Whereupon he ushered him into a dazzling apartment that was one vast mosaic of precious gems, indicated a richly carved chair, into which the young scientist dropped wonderingly.

"Now then, Professor," continued the mighty little dwarf, when he was seated in a chair even more sumptuous, "suppose we have a friendly little discussion. I have been much interested in your experiments on heat radiation. What you demonstrated this morning, in particular, was most absorbing. You have hit upon a rather profound scientific principle, yes?"

"Possibly," Kendrick admitted, quite conscious that he was being patronized.

"Oh, don't be modest, my dear fellow!" smiled the dwarf. "I am the last one to belittle your achievement. Indeed, it is because of it that I have invited you here to-day. Permit me to introduce myself, and to make clear one or two possibly perplexing matters. Then I am sure we shall have a most agreeable chat."

His name was Cor, he said, and he was in truth the monarch of this strange realm. His people had come from the one-time planet of Vada, far distant in the universe. A thousand years ago, this planet had been doomed by the approach of an alien star. Their great scientist, Ravv, had met the emergency by inventing the disc, into whose construction they had poured all their resources. The pick of their populace had been salvaged on this giant life-raft. The rest had perished when that destroying star had crashed down on the doomed Vada.

Since then these survivors and their descendants had been voyaging through space on their marvelous disc. For hundreds of years they had given no thought to the future, content to drift on and on in the interstellar void, breathing an atmosphere produced artificially. But at length the inevitable had happened. This superb piece of mechanism devised by their super-genius, Ravv, was beginning to show signs of wear. Some of its mighty engines were nearing the exhaustion point. Either they must soon find a planet comparable with the one they had once known, where

they could pause and rehabilitate their machinery, or they must disintegrate and pass into oblivion.

Faced with that crisis, Cor had long been seeking such a planet. He had found it, at last, in the earth—and had resolved that this was where they were going to alight and transplant the civilization of ancient Vada, pending such time as they could take to space again.

For some months now they had been hovering over various portions of the earth, studying its geography and its peoples, with the result that they had concluded the United States offered the most logical point for launching the attack. Once this country was subdued, they were in possession of the richest and most advanced section of the planet. The conquest of the rest of it could await their leisure.

With such an invasion in view, their scientists had mastered the language of the country. This had been accomplished very easily, since in addition to their power of mingling with the populace in an invisible form, they had the principles of radio developed to a

high degree and were able to tune in on any station they wanted.

Kendrick sat there, stunned, as Cor followed his astounding revelation of their origin with this calm plan for the conquest of America, of the world. Why, of all people on earth, had he alone been singled out for this disclosure?

He asked the question now.

"My dear Professor, can't you really guess?" replied Cor, with that leathery smile. "Hasn't it dawned that you were a little too near our own field with that machine of yours? A trifle more research, a slightly different application—and you would have become a dangerous enemy."

"You—you mean—?"

"I mean there isn't a great deal of difference between the experiments you have been making and those our great Ravv once made. For instance, had you broadcast your heatricity, as you call it, instead of

trying to transmit it on wires—well, picture a receiving apparatus in each home of the land, like your commercial radio sets. You would have become a billionaire, don't you see?"

Kendrick saw indeed. It was simple, so simple! Fool—why hadn't he thought of it?

"But your invention will never make you wealthy now, my dear fellow," Cor went on, tauntingly. "You will be our guest, here, until we have taken over your interesting country. After that, if there is any need for the broadcasting of heat, we will furnish it ourselves. We have those facilities, among others, fully developed. Would you care to see our plant?"

Kendrick naturally admitted that he would, so the dwarf led him through a rear door and up a winding flight of stairs. They emerged presently into a great laboratory housed in the glass-roofed pinnacle of the tower.

There he beheld a sight that left him breathless. Never before had he seen such an assemblage of

scientific apparatus. Its vastness and strangeness were fairly overpowering, even to a man as well versed in physio-chemical paraphernalia as he was.

Before his eyes could take in a tenth part of the spectacle, Cor had led him to the left wall.

"There," he said, "you will observe a development of your heat generator."

Kendrick looked—to see a long bank of large vacuum-tubes, each about three feet high and a foot wide, connected by a central shaft that caused series of little vanes in each of them to revolve at lightning speed.

Around the apparatus moved numerous small attendants, oiling, wiping, adjusting its many delicate parts.

"Well, what do you think now?" asked Cor.

Kendrick made no reply, though he was thinking plenty.

"You see, it is your invention, my dear Professor," the dwarf went on in his taunting voice, "only anteceded by a thousand years—and rather more perfected, you must admit."

He walked now to the center of the laboratory, where stood a huge dial of white crystal, ranked with many levers and switches, all capped with the same material.

"Behold!" he said, throwing over one.

Instantly there came again that peculiar low humming that had so puzzled him a few minutes before—and the entire room, its engines, its attendants, Cor himself, leapt into invisibility. Only Kendrick remained, facing the faintly visible crystal dial.

Then he saw a switch move, as though automatically. But no, for the dwarf's hand was on it now. Visibility had returned. The vibration ceased.

"That is the central control," said Cor. "Our city and all its inhabitants become invisible when that switch

is thrown. Only the dial remains, for the guidance of the operator, and even that cannot be seen at a distance of more than fifty feet. But now behold!"

He raised his hand, touched a watch-like device strapped to his wrist—and was instantly invisible. But the laboratory and every machine and person in it remained in plain view. Nor was there any vibration now.

The next moment, having touched that curious little device again, Cor reappeared.

"That is the local control," he said. "Every one of our inhabitants, except those under discipline, has one of these little mechanisms. It enables us to make ourselves invisible at will. A convenience at times, you must admit."

"Decidedly," Kendrick agreed. "And the principle?"

"Quite simple. One of those, in fact, that lies behind your researches. Doubtless you would have hit upon it yourself in time. Your own scientist, Faraday, you may

recall, held the opinion that the various forms under which the forces of matter manifest themselves have a common origin. We of the disc, thanks to our great Ravv, have found that common origin."

It was the origin of matter itself, Cor said, which lay in the ether of interstellar space—energy, raw, cosmic—vibrations, rays.

By harnessing and controlling these various rays, his people had been able to accomplish their seeming miracles—miracles that the people of earth, too, were beginning to achieve—as in electricity, for instance, and its further application, radio.

But the people of Vada had long since mastered such simple rays, and now, in possession of vastly more powerful ones, had the elemental forces of the universe at their disposal.

The disc was propelled through space by short rays of tremendously high frequency, up above the ultra-violet. The same rays, directed downward instead of outward, enabled them to overcome the pull of

gravity when in a planet's influence, as at present. And the escalator rays, by which they could proceed to and from the disc, were also of high frequency, as were their invisibility rays.

"But you, Professor, are more interested in low frequency rays, the long ones down below infra-red," continued Cor. "You have seen our development of the heat-dynamo principle. It utilizes, I might add, not only solar radiation but that of the stars as well. There being a billion and a half of these in the universe, many of them a thousand times or more as large as your own sun, we naturally have quite an efficient little heating plant here. It provides us with our weapon of warfare, as well as keeping us warm. Permit me to demonstrate."

He led the way to a gleaming circle of glass like an inverted telescope, about a yard in diameter, mounted in the floor.

"Look!" said the dwarf.

Kendrick did so—and there, spread below him, lay the

floor of the desert. His camp, his apparatus, were just as he had left them.

Cor now moved toward the dial.

"Behold!" he said, pulling a lever.

Instantly the scene below was an inferno. Stricken by a blast of stupendous heat, the whole area went molten, lay quivering like a lake of lava in the crater of an active volcano.

"Suppose, my dear Professor," smiled the dwarf, strolling back from the dial, "just suppose, for instance, that instead of the lonely camp of an obscure scientist, your proud city of New York had been below there!"

Kendrick shuddered.

Well he knew now the terrible power, the appalling menace of this strange invader.

"I would prefer not to make such a supposition," he

said, quietly, with a last thoughtful glance at that witches' caldron below.

"Then let us think of pleasanter things. You are my guest of honor, sir—America's foremost scientist, though she may never realize it," with a piping chuckle. "To-night there will be a great banquet in your honor. Meanwhile, suppose I show you to your quarters."

Nettled, fuming, though outwardly calm, Kendrick permitted himself to be escorted from the laboratory to an ornate apartment on one of the lower floors.

There Cor left him, with the polite hint that he would find plenty of attendants handy should he require anything.

Alone now, in the midst of this vast, nightmarish metropolis, he paced back and forth, back and forth—knowing the hideous fate that threatened the world but powerless to issue one word of warning, much less avert it.

Kendrick was still thinking and brooding along these lines when he saw the door of the apartment swiftly open and close again.

Someone had entered, invisible!

Backing away, he waited, tense. Then, suddenly, his visitor materialized. With a gasp, he saw standing before him a beautiful girl.

She was a young woman, rather, in her early twenties. Not one of these pigmies of the disc either, but a tall, slender creature of his own world.

Her hair was dark, modishly bobbed. Her eyes were a deep, clear brown, her skin a warm olive. And she was dressed as though she had just stepped off Fifth Avenue—which indeed she had, not so long ago, as he was soon to learn.

"I hope I haven't startled you too much, Mr. Kendrick," she said, in a rich, husky murmur, "but—well, there wasn't any other way."

"Oh, I guess I'll get over it," he replied with a smile.
"But you have the advantage of me, since you know my name."

Hers was Marjorie Blake, she told him then.

"Not the daughter of Henderson Blake?" he gasped.

"Yes," with a tremor, "his only daughter."

Whereupon Kendrick knew the solution of a mystery that had baffled the police for weeks. The newspapers had been full of it at the time. This beautiful girl, whose father was one of America's richest men and president of its largest bank, had disappeared as though the earth had swallowed her. She had left their summer estate at Great Neck, Long Island, on a bright June morning, bound for New York on a shopping tour—and had simply vanished.

Suicide had been hinted by some of the papers, but had not been taken seriously, since she had no apparent motive for ending her life. Abduction seemed to be the more logical explanation, and huge

rewards had been offered by her frantic parents—all to no avail.

What had happened was, she now explained, that after visiting several shops and making a number of purchases, she had stepped into Central Park at the Plaza for a breath of fresh air before lunching at the Sherry-Netherlands, where she planned to meet some friends.

But before advancing a hundred yards along the secluded path, she had been seized by invisible hands—had felt something strapped to her wrist, before anyone came in sight—and then, invisible too, had been lifted up, whirled away into a vast, humming vibration that sounded through the air.

Once on the disc, it had swept off into space at incredible speed, pausing only when some hundreds of miles above the earth and invisible from below without mechanical aid. When its vibration finally ceased that amazing city had leapt before her eyes.

Then, her own visibility restored, she had been led

into the presence of that mighty little monarch, Cor, who explained that she had been seized as a hostage and would be held as an ace in the hole, pending conquest of her country. Since when she had been a prisoner aboard the disc.

Learning of Kendrick's capture, from gossip among the women, she had taken the first opportunity of coming to him, in the hope that between them they might devise some means of escape.

Indeed, that was his own fondest hope—their imperative need, if the people of America and of the earth were to be saved from this appalling menace. But what basis was there for such a fantastic hope? Just one, that he could see.

"That thing on your wrist," he said, voicing it. "I'm surprised they let you wear one of those."

"They don't," she smiled. "I stole it!—from one of the maids in my apartment. It was the only way I could get here without being seen. I felt I must see you at once. We've got to do something, soon, or it'll be too

late. I felt that, as a scientist, you might have some idea how we could get off."

"How do the people themselves get off?" he asked.
"That escalator ray—do you know how they use it?"

"No, I've never been able to find out. They don't let me go near that part of the city."

Kendrick reflected a moment.

"Let's have a look at that invisibility affair," he said.

She removed it from her wrist, handed it to him.
Somewhat in awe, he examined it.

The mechanism portion, which was linked in a strap of elastic metal, resembled only superficially a watch, he now saw. Rather it had the appearance of some delicate electric switch. Rectangular in shape, it was divided into two halves by a band of white crystal. In each of these halves were two little buttons of the same material, those on one side round, on the other square.

"Which buttons control the invisibility?" he asked.

"The square ones," she replied. "One's pushed in now, you see. If you should push the other, the first would come out—and you'd pass out of the picture, so to speak."

Kendrick was half tempted to try the thing then and there, but deferred the impulse.

"What are the round buttons for?" he inquired instead.

Marjorie didn't know, but thought they were probably an emergency pair, in case something went wrong with the square ones. In any event, nothing happened when you pushed them.

Kendrick pushed one, just to see. It was true. Nothing happened—but he seemed to sense a faint, peculiar vibration and a wave of giddiness swept over him. On pushing the other, which released the first, it stopped.

He handed the device back to Marjorie.

"There's your bracelet. Now, if I can just get one like it, I think we'll get down to earth all right."

"Oh, Mr. Kendrick!" Her eyes lit up eagerly. "Then you've thought of a way?"

"Not exactly. I think I've discovered their own way. I can't be certain, but I'm willing to gamble on it, if you are."

"Then you—you think those round buttons are connected with the escalator rays?"

"Exactly! I think they control individual descent and ascent, just as the square ones control individual visibility and invisibility. At any rate, it's the hunch I'm going to act on right now, if you're with me."

"Oh, I'm with, you!" she breathed. "Anything, death almost, would be preferable to this."

"Then stand by, invisible. I'm going to get one of my jailors in here and relieve him of his wrist-watch."

Marjorie touched that little square button on her own. She instantly became invisible.

Kendrick touched a button too, a button he had noticed beside the door. As he had supposed, it brought one of the Vadans.

Shutting the door quietly, he seized the fellow before he could move his hand to his wrist. Thwarted in his attempt to vanish from sight, the diminutive guard attempted an outcry. But Kendrick promptly throttled him.

Marjorie had reappeared by now and together they bound him to a chair with a gilded cord torn from the drapery.

Removing the precious mechanism from his wrist, Kendrick slipped it on his own.

"Now let's go!" he said, pressing the protruding square button of the device. "We haven't a minute to—my golly, what a peculiar sensation!"

"It is rather odd, isn't it?" she laughed, pressing her own and joining him in that invisible realm.

"Feels like a combination electric massage and cold shower! Where are you, anyway? I can't see you."

"Of course you can't!" came an unseen tinkle. "Here!"

He felt her brush him.

"Better hold hands," he suggested, then gave an invisible flush he was glad she couldn't see.

"All right. A good idea."

Her delicate hand came into his, soft, warm. Heart vibrating even faster than his body, his whole being a-quiver with a strange exaltation, Kendrick opened the door, and they left the apartment.

The next half-hour was the tensest either of them had ever experienced. Every foot of the way was fraught with peril.

Not only did they have to carefully avoid the visible swarms of little people who hurried everywhere, but had to be on their guard as well against any who might be moving about like themselves under cover of invisibility.

Nor could they use any elevator or public conveyances, but were obliged to make their way down to the concourse by heaven knew how many flights of stairs, and cross heaven knew how many teeming streets on foot, before they reached the amber court, below which the trap-door and their hope of freedom.

They got there at last, however, descended, and peered down from that yawning brink upon the desert floor—to draw back with gasps of dismay. For the area still gleamed semi-molten from the stupendous blast that had wiped out Kendrick's camp.

"W-what is it?" she gasped.

Swiftly he told her.

"But isn't there any way around it? Look, over there to the left. One edge of the crater seems to end almost underneath us."

It was true that the center of the caldron was far to the right of where they stood, and that its left rim was only a little within their direct line of descent. But to land even one foot inside that inferno would be as fatal as to alight in its very midst.

Kendrick was thinking fast.

"There's just a chance," he said. "It all depends upon how wide the zone of these escalator rays is, and whether we can tune in on them. At least, I can probably answer the latter question."

Pushing the protrudent round button on his mysterious bracelet as he spoke, he leaned over the edge of the trap-door and awaited results.

They were not long in coming. The vibration he was already under from the invisibility rays seemed to double. Alternate waves of giddiness and depression,

of push and pull, swept over him.

A minute of it was enough. He pressed the round button that now protruded, ending this influence, and faced Marjorie, stating:

"I'm positive now that these things control descent and ascent. As nearly as I can figure, the rays work on the principle of an endless belt. If you're up here, you get carried down, and vice versa. As to how wide the belt is, and whether you can move sideways on it, remains to be seen. Anyway, I'm going to take a chance. I'll go first. If my guess is wrong, you—well, needn't follow."

"No, I'm going with you!" she declared resolutely.
"We've come this far together. I shan't be left alone now. Let's go!"

And again her soft, warm hand was in his.

Lord, what a girl! How many would be brave enough to take a gamble like that, on a fellow's mere supposition?

"All right—go it is!" he said. "Push your round button, like this." He showed her the way he thought was right, pushed his own. "Ready?"

"Ready!"

Their voices were grave. It was a grim prospect, stepping off into space like that, with only a guess between them and death.

"Then jump!"

They jumped, gripping each other's hands tightly—and instead of dropping like plummets were caught in a powerful field of force and whirled gently downward.

"Oh, you were right!" gasped Marjorie, awed. "See, we—"

Then she paused, horror-stricken, for it was obvious that they were to descend within that lake of molten glass, unless they could change their course at once.

"Quick!" he called. "Hold fast! Now—run!"

Breathless, they raced to the left, across that invisible descending belt.

Too far, Kendrick knew, and they would plunge outside its zone, fall crushed and mangled. Not far enough, and they would meet cremation. It was a fearful hazard, either way, but it had to be taken.

They were almost down, now, and still not quite far enough to the left. The heat of that yawning crater rose toward them.

"Faster—*faster*!" he cried, fairly dragging her along with him.

A last dash—a breathless instant—and they stood there on the ground, not three feet from the edge of doom.

Swooning with the heat, Marjorie swayed against him, murmured an incoherent prayer.

"Take heart!" he whispered, lifting her bodily and bearing her some yards away. "We're down—safe!"

Their safety was but relative, however, Kendrick well knew. Until they could put miles between them and this monstrous disc, they were not really safe. No telling how soon their escape might be discovered. No telling what terrible means Cor might take of curbing their flight.

So as soon as Marjorie had recovered sufficiently to proceed, they headed off across the desert at a fast walk toward Ajo, where he hoped to catch the afternoon train for Gila Bend. From there, they could board the limited for Tucson and points east, when it came through from Yuma that night.

They had tuned out on the escalator rays, but continued on still invisible—for the disc hung above them in plain view and it would have been suicide to let themselves be seen.

Even so, Kendrick soon began to have an uneasy feeling of being followed. He looked around from time

to time, but could see nothing. Were some of those invisible little creatures on their trail?

He said nothing to Marjorie of his anxiety, but presently she too began glancing backward uneasily, every few steps.

"They are near us!" she said at length, in a whisper. "I can sense them."

It was more than sense, they soon discovered. Little paddings became quite audible, and once or twice they saw the sand scuffed up, not twenty feet away, as though by a foot passing over it.

Meanwhile they were climbing a rise of ground, broken by many small hummocks and dotted with thorny shrubs. On the other side, at the foot of a long down-slope, lay Ajo.

Once they reached the summit, Kendrick felt sure they could outdistance their pursuers on the descent. Already, if his watch was right, the train was preparing to pull out. It would be a breathless dash,

but he was confident they could make it.

So he reassured Marjorie as best he could, and helped her on up the slope.

They were practically on the summit and already in view of the little railroad station and huddle of shacks below—when suddenly he felt himself tripped and flung violently to the ground. At the same instant, his companion emitted a scream, as she felt herself seized by invisible hands.

Leaping to his feet, Kendrick flailed out with solid fists at their attackers. Groans answered the impacts and he knew his blows were taking effect.

Free for a moment he dashed to Marjorie, felt for the midgets who swarmed around her. Seizing one of the invisible forms, he lifted it and flung it crashing to the ground. Another, likewise, and another.

Then he threshed his legs, where two of the creatures clung, trying to drag him down again. They flew through the air, with cries of fright.

"Well, so far, so good!" he exclaimed. "We won't wait to see if there are any more. Come on—let's go!"

"Right!"

Reaching for each other's hands, they raced down the slope.

Halfway there they saw a warning blast of steam rise from the engine, followed by a whistle.

"They'll be pulling out in a minute now!" he gasped, increasing speed. "We've got to make it!—our only chance!"

"We *will* make it!" she sobbed through clenched teeth, meeting his pace.

Glancing over his shoulder, after another fifteen seconds, Kendrick saw that the disc was no longer visible. Since there was no vibration he realized with relief that it was now hidden behind the slope they were descending.

"Quick—push your button!" he said, pushing his own.

They came out of the influence of the invisibility rays, raced breathless on down the slope—gained the station platform just as the train was getting under way.

Helping the exhausted girl aboard, he mounted the steps himself, led her through the vestibule into its single passenger coach.

Dropping into a seat, they sat there panting as the train gathered speed.

By the time the decrepit but life-saving little local drew into Gila Bend they had somewhat recovered from their harrowing experience.

Marjorie was still pale, however, as Kendrick helped her from the train.

"I may recover," she said with a wan smile, "but I'll never look the same! An old saying, but I know what it means now."

He thought better of a sudden impulse to tell her she looked quite all right to him. Instead, he said grimly:

"I know now what a lot of things mean!"

The Tucson limited would not be through for over an hour, they learned. That would give them time to hunt up the authorities and sound a warning of the ominous invader that was in the vicinity. Perhaps, by prompt military action, it might be destroyed, or at least crippled.

But first they went to the telegraph office, where Marjorie got off a message that would bring joy to her grieved family.

While standing there outside the barred window, odors of food wafting to them from a nearby lunch-room.

"Um-m!" she sniffed. "That smells good to me! I haven't tasted any earthly cooking for ages. Everything on that horrible disc was synthetic."

"Then I suggest we have ham and eggs, at once," he said. "Or would you prefer a steak?"

"I think I'll have both!"

As they walked into the lunch-room, Kendrick told her of the banquet in his honor Cor had promised for that night.

"I guess I didn't miss much," he ended.

"You certainly didn't!" she assured him, with a smile. "It would have opened with a purée of split-molecule soup, continued with an entrée of breaded electrons, and closed with an ionic café."

He laughed.

"I'm just as well satisfied. I was unable to attend! Humble as it is, I think this will prove to be much more wholesome food."

Night had fallen by the time they left the lunch-room. Glancing at his watch, Kendrick saw that they still

had better than a half-hour before the limited was due, so they betook themselves to the police station.

It was only a block away and in consequence they weren't long reaching it.

The chief had gone home, the officer at the desk informed them, but if there was anything they cared to report, he would be glad to make note of it.

A big raw-boned westerner, he shifted his quid as he spoke and spat resoundingly in a cuspidor at his feet.

"All right, then—get your pencil ready!" said Kendrick with a smile. "This is Miss Marjorie Blake, daughter of Henderson Blake, of New York. Perhaps you read of her disappearance, a few weeks ago. And I...."

As he introduced himself and told briefly of their astounding experience, the officer's eyes bulged with amazement.

"Say, what yuh-all tryin' to hand me?" he snorted finally. "D'yuh think I was born simple?"

"Press your button!" whispered Marjorie. "Show him how the invisibility ray works. It'll save a lot of argument."

"Right!"

He held up his wrist.

"See this? Now watch!"

Whereupon he pressed the button. But to their dismay, nothing happened.

"Wa-al. I'm still watchin'!" drawled the officer. "Who's loony now?"

Kendrick examined the mechanism in impatience, pressed that little button repeatedly: but still nothing happened.

"Try yours!" he told Marjorie finally.

She did so, with similar results—or lack of them, rather.

"Something's wrong," he said at length. "The ray isn't working."

"Wrong is right!" declared the officer with a contemptuous flood of tobacco juice. "Yuh folks better go catch yuhr train 'fore yuh ferget where it is."

Chagrined, embarrassed, they took their leave, headed back toward the railroad station.

"Of all the utterly silly things!" declared Marjorie, as they walked along. "Why do you suppose it didn't work?"

Kendrick didn't reply at once. When he did, his voice was grave.

"Because the disc has gone!" he said. "We are outside its zone of influence. That's my hunch, at least, and I think we'd better act on it."

"You mean...?"

"I mean our escape has probably caused them to

hurry their plans. They're probably over New York right now. I think we'd better get there the quickest possible way."

The result was that when the train came, they remained on it only to Tucson. There they chartered a fast plane and started east at once.

At sunset the following day the plane swooped out of the sky and slid to rest on the broad grounds of the Blake estate at Great Neck.

As Kendrick stepped from the cabin and helped Marjorie down, a tall, distinguished-looking man with graying hair and close-cropped mustache came hurrying toward them.

"Daddy!" she cried, rushing into his arms. "Oh, Daddy—Daddy!"

Even without this demonstration. Kendrick would have recognized Henderson Blake from pictures he had seen recently in the papers.

Now he was introduced, and Blake was gripping his hand warmly.

"I don't quite know what this is all about, Professor," he heard the great financier say. "Marjorie's telegram last night was as cryptic as it was over-joying. But I do know that I owe you a deep debt of gratitude."

"Yes, and you owe our pilot about a thousand dollars, too!" put in the daughter of the house, clinging to her father's arm. "Please give him a check—then we'll go inside and I'll explain all about it."

"A matter very much easier dispatched than my debt to Professor Kendrick," said Blake, complying.

The check was for two thousand, not one, the pilot saw when he received it.

"Thank you very much, sir!" he said, saluting.

"Don't mention it. Good night—and good luck to you!"

The pilot returned to his plane, it lifted from the lawn,

droned off into the twilight.

Then they approached the cool white villa that stood invitingly a hundred yards or so away beyond sunken gardens.

As they neared it, a handsome, well-preserved woman whose face reflected Marjorie's own beauty came toward them. Lines of suffering were still evident around her sensitive mouth, but her dark eyes were radiant.

"Mother!"

"My poor darling!"

They rushed into each other's arms, clung, sobbing and laughing.

Kendrick was glad when these intimate greetings were over and he had met Mrs. Blake.

They were in the drawing-room now, listening to a somewhat more lucid account of their daughter's

experiences and those of her rescuer. Marjorie was doing most of the talking, but every now and again she would turn to Kendrick for verification.

"Heavens!" gasped Mrs. Blake, finally. "Can such things be possible?"

"Almost anything seems possible nowadays, my dear," her husband told her. "And you say, Professor, that you have brought back samples of this invisibility device?"

"Yes, we have, but I can't promise they'll work. I'll try, however."

Whereupon, sceptically, he pressed that little square button—and instantly faded out of sight.

"Good Lord!" cried Blake, leaping to his feet. "That proves it! Why, this is positively—"

His remarks were cut short by a scream of terror from his wife.

"Marjorie—Marjorie!" she shrieked.

Wheeling, he faced the chair where his daughter had sat. It was empty, so far as human eyes could see.

"Don't worry Mother—Daddy!" came a calm voice from it. "I'm quite all right—coming back—steady."

And back she came, as did Kendrick, from the empty chair beside her.

His face was grave. The success of the demonstration, which had proved their story to practical-minded Henderson Blake, had proved to him something altogether more significant. The disc, as he had surmised, had rushed eastward immediately on learning of their escape, and was now probably hovering right over New York.

"Marvelous—marvelous!" declared Blake. "But that heat ray, Professor. That sounds bad. You are convinced it is as powerful as they make out!"

"Positively! That blast they let go in the desert would

have utterly destroyed New York."

"Hm! Yes, no doubt you're right. I fully realize how the fearful menace of this thing. Do you think the military authorities will be able to cope with it?"

"I don't know. Perhaps, if they are prompt enough."

"And is there no other way—no scientific way?"

Kendrick grew thoughtful.

"I wonder," he said at last. "There's just a possibility—something running through my mind—an experiment I'd like to make, if I had the facilities of some large electrical laboratory."

"You shall have them to-morrow!" Blake promised.

"I'm one of the directors of Consolidated Electric. Their experimental laboratory in Brooklyn is the finest of its kind in America. I'll see that you have the run of it."

"That will be very kind," said Kendrick. "But don't

expect anything to come from it, necessarily. It's just a theory I want to work out."

A butler entered at this moment and announced dinner.

"Well, theories are mighty these days!" beamed Blake, as they rose, clapping the younger man on the shoulder. "You go ahead with your theories—and I'll bring a few facts to bear. To-morrow noon I'll escort some military men and others of my friends over to the laboratory to hear and see something of this menace direct. Meanwhile, and during this crisis, it will honor me to have you as my guest."

"Our guest!" amended Marjorie, with a warm smile.

Next morning Blake motored Kendrick out to the Brooklyn Laboratory of the Consolidated Electric Utilities Corporation and installed him there.

Then he left—to return at noon with the promised delegation of generals, admirals, statesmen and financiers.

They were all frankly sceptical, though realizing that Henderson Blake was not a man given to exaggeration. Nor did their scepticism altogether vanish when Kendrick had ended his bizarre story with a demonstration of the invisibility device.

Murmurs of amazement ran around the laboratory, it is true, but the more hard-headed of his spectators charged him with having invented the apparatus himself. Though they didn't come right out and say so, they seemed to imply that he was seeking publicity.

Annoyedly, Kendrick tried to refute their charges. But even as he was summoning words, refutation utter and complete came from the air.

A low, humming vibration sounded, grew in volume till it filled the room—and as suddenly ceased: The light of midday faded to twilight.

"*The disc!*" gasped Kendrick, rushing to the west windows.

They followed, tense with awe. And there, between

earth and sun, its myriad towers and spires refracting a weird radiance, hovered that vast flying city.

"My God!" muttered a famous general, staring as though he had seen a ghost.

A great statesman opened his lips, but no words came.

"Appalling! Incredible!" burst from others of that stunned assemblage.

Their comments were cut short by a broadcast voice, thin and clear, tremendously amplified, a voice Kendrick recognized at once as that of Cor.

"People of America!" it said. "We of the planet Vada have come to conquer your country. You will be given forty-eight hours to lay down your arms. If complete surrender has not been made by high noon, two days from now, New York will be destroyed."

The voice ceased. The humming recommenced—waned in volume till it died away. Twilight turned

once more to midday.

Peering fixedly through the west windows of the laboratory, the little assemblage saw the disc swallowed up in the clear blue sky.

Then they turned, faced one another gravely.

Outside, on the streets, confusion reigned. In newspaper plants, presses were whirling. In telegraph and cable offices, keys were ticking. From radio towers, waves were speeding.

Within an hour, the nation and the world knew of this planetary invader and its staggering ultimatum.

Naturally, the government at Washington refused to meet these shameful terms. Military and naval forces were rushed to the threatened metropolis. The Atlantic Fleet steamed up from Hampton Roads under forced draught and assembled in the outer harbor. Thousands of planes gathered at Mitchell Field and other nearby aerodromes.

But where was the enemy? He must be miles up in space, Kendrick knew, as he toiled feverishly in the laboratory over his experiment after a sleepless night. For had that flying city been nearer earth, it could not have maintained invisibility without that peculiar humming vibration.

Scout planes urged on by impatient squadron commanders, climbed till they reached their ceilings, searching in vain. They could encounter nothing, see nothing of the invader.

Thus passed a morning of growing tension.

But by noon of that day, with a bare twenty-four hours left before the expiration of the ultimatum, the disc came down, showed itself boldly.

There followed stunning disasters.

One salvo, and the ray shot down—the Atlantic Fleet, the pride of America, burst and melted in flaming hell. Squadrons of planes, carrying tons of bombs, frizzled like moths in the air. Mighty projectiles

hurled by land batteries were deflected off on wild trajectories.

Appalled, the nation and the world followed in lurid extras these crushing defeats.

By nightfall of that day, all seemed lost. All opposition had been obliterated. America must capitulate or perish. It had until the next noon to decide which.

Meanwhile, in that great Brooklyn laboratory, Kendrick was working against time, besieged by frantic delegations of the nation's leaders. They knew now that their one hope lay in him. Was he succeeding? Was there even any hope?

Face haggard, eyes bloodshot from lack of sleep, he waved them away, went on with his work.

"I will tell you—as soon as I know."

That was all he would say.

Followed a night that was the blackest in all history,

though the myriad stars of heaven shone tauntingly brilliant in the summer sky.

At length, as dawn was breaking. Kendrick paused in his labors.

"There!" he said, grimly, surveying an apparatus that seemed to involve the entire facilities of the laboratory. "It is done! Now then—will it work?"

The delegation were called to witness the test.

Henderson Blake was among them, as was Marjorie. She stepped forward, as he prepared to make the demonstration.

"I *know*, somehow, you're going to be successful!" she murmured, pressing his hand, meeting his eyes with a smile of confidence.

"I hope you're right—Marjorie!" he replied, letting slip the last word almost unconsciously.

Her face colored warmly as she stepped back and

rejoined her father.

Kendrick's heart was beating fast as he turned to his instruments. How could he fail, with faith like that behind him?—love, even, perhaps! He mustn't fail—nor would he, if his theories were sound.

Addressing the assemblage, he explained briefly the complicated apparatus.

"These towers," he said, pointing to four steel structures about ten feet high, arranged at the corners of a square roughly twenty feet across, "are miniature radio masts. The area enclosed by them, we will assume, is the city of New York. That metal disc suspended above the area represents the invader. It contains a miniature heat-generator such as I was experimenting with recently in the Arizona desert."

He paused, threw a switch. Somewhere in the laboratory a dynamo began to whirl.

"I am now sending electro-magnetic waves from the four towers," he resumed. "But instead of

broadcasting them in every direction. I am bending them in concave cathode of force over the city. You may picture this cathode as an invisible shield, if you choose, but it is more than that. It is a reflector. If my theories are right, the radio-energetic ray I am about to project upon it from my miniature disc will be flung back to its source as though it had been a ray of light falling on a mirror. The success of the experiment depends upon what the result will be."

Kendrick ceased, moved toward a rheostat.

As he made ready to touch it, a breathless tension settled upon the assemblage. Upon the outcome of what was now to happen rested the fate of America—and the world.

Calmly, though every fiber of his being was at breaking stress, the young scientist opened the rheostat.

For an instant, the ray seared down—then, as it boomeranged back, the disc burst into flame, dissolved, disintegrated. A thin dust, like carbon,

slowly settled to the laboratory floor.

Cutting off the current from the radio towers, Kendrick faced them, a light of triumph in his tired eyes.

"You see—it works," he said.

They saw. Beyond a doubt, it worked!

And what Kendrick saw, as his eyes met Marjorie's, made him forget his fatigue.

The rest was a mad scramble of preparation. Only a few brief hours remained, and much was to be done.

The application of the principle that had just been demonstrated involved a hook-up from the Consolidated Electric laboratory with every broadcasting station in the metropolitan area, power being supplied by commandeering every generating plant within a radius of fifty miles.

The city, moreover, had to be evacuated of all but the

few brave hundreds who volunteered to stand by their posts at radio stations and generating plants.

As for Kendrick, it was the busiest, most hectic morning he had ever experienced. Only the realization of a girl's love and a nation's trust enabled him to overcome the exhaustion of two sleepless nights.

At length, a little before eleven, all was in readiness. Just two questions troubled the young scientist's mind. Had the people of the disc learned of their preparations to counter the attack? And would the improvised broadcasting apparatus of the area stand the stupendous strain that would be placed upon it if the ray came down?

The first of these questions was answered, staggeringly, at a quarter after eleven.

"Kendrick—oh, my God!" cried Blake, bursting into the laboratory. "Marjorie—they've got her again! Look! Read this!"

He thrust out a piece of paper. Kendrick took it, read:

Your daughter will be my queen, after this noon.

"Where'd you get it?" he gasped.

"One of the invisible devils thrust it into my hand right out in the street, not five minutes ago," Blake explained, trembling with anguish. "Do you realize what this means, Kendrick? She's on the disc now—and in a scant three-quarters of an hour...."

"Yes, I realize!" his voice came grimly. "And I realize, too, that they don't know their fate. They'll stay. There's forty-five minutes yet. We can't abandon our defense against the ray, not even for Marjorie. But I'll go, I'll rescue her—or die with her!"

And even as Blake mutely reached out his hand to grip that of the determined young man who stood before him. Kendrick touched his wrist mechanism and went invisible.

Once on the street, he pressed the escalator button as

well—and by the strength of the vibrations that followed, he knew he must be very close within that mysterious lifting zone.

Running west a block, he found it growing stronger.

Fairly racing now, he continued on toward the river, progress unhampered in the deserted streets.

Suddenly, with a thrill of exultation, he felt himself swept up, whirled away toward that great shimmering hulk against the sun.

"What hope?" he was thinking. "What possible hope?" And the answer came: Cor!

Reaching the disc, he switched out the escalator influence and hastened across the city to that monumental structure of jade-green stone.

The mighty little dwarf would be up there in his glittering mosaic apartment, or in his pinnacle laboratory, perhaps, ready to pull the lever that would release that stupendous blast of heat.

Gaining the jewelled door of the monarch's quarters at last, after escaping detection by a hair's breadth more than once, he pressed the button outside, just as the guard had done that first time.

In response, the door opened—and there stood Cor.

He stood there an instant, that is, while the expression on his leathery face went from inquiry to alarm. Then, as Kendrick burst into the room and shut the door, he went invisible.

In that same instant, the young scientist's eyes beheld a sight that caused his heart to leap. There sat Marjorie, bound in a chair, an expression half of hope, half of dejection, on her face.

"It's I—Gordon!" he called. "Take courage!"

"Oh, I prayed so you'd come—and you came!" she murmured as her face lighted. Then, tensely, she added, "The door—look out!"

Kendrick wheeled, and just in time. The door was

opening.

"Not so fast!" he called, lunging.

His hands gripped the dwarf, yanked him back, throttled him before he could emit a cry, pushed the door shut.

Cor struggled like a madman, but it was futile. Kendrick's hands cut into his throat like a vice. After a moment or two, he gasped, relaxed.

Releasing his grip then, Kendrick felt for his wrist, stripped off his bracelet—whereupon the dwarf became visible. His face was putty-white. He was either dead or unconscious.

Restoring his own visibility then, he advanced to Marjorie, swiftly freed her.

"Take this!" he said, handing her Cor's bracelet.

She slipped it on.

"Now let's tie him and get out of here. He may be dead, but we can't take any chances."

The dwarf wasn't dead, however, for he groaned and opened his eyes as they lifted him into the chair.

"You win, Professor—but it avails you nothing!" He smiled maliciously. "My capture, my death even, will not prevent the ray. The orders have been given. It will be projected sharp at twelve. You but go to your doom!"

"That," said Kendrick, "is a matter of opinion."

Swiftly they bound him, gagged him.

"And now," he added, "we wish you good day—and such fate as you deserve!"

Then, turning to Marjorie:

"Your hand again!"

There was a new tenderness in its soft warmth that

thrilled him.

They touched their buttons, went invisible.

Silently, then, they stole from the apartment. Swiftly they made their way down to the concourse, raced across the city to the amber court, descended to the trap-door.

It must be nearly twelve, Kendrick knew. He couldn't look at his watch, for it as well as himself was invisible. Indeed, even as they stood there, poised for the plunge, a faint whistle rose from below.

Marjorie trembled.

"Steady!" he spoke. "Some of them always blow a minute or two before. Are you ready?"

"Yes!"

"Then press your button—jump!"

Even as they leapt, the sickening thought came that

perhaps the escalator ray was no longer running. But the fear was unwarranted. They were caught up, whirled gently downward.

Moving along laterally, as they descended, they were able to land without difficulty in the middle of a deserted street near the Consolidated Electric laboratory.

"Thank heaven!" she sighed, as their feet touched solid ground. They pressed off both buttons, becoming visible once more.

"Echo!" he agreed. "So let's—"

But Kendrick never completed that sentence—for now whistles all over the metropolitan area, rising from the generating plants, announced the ominous hour.

It was high noon. The ultimatum had expired.

Lifting tense faces to the disc, they waited. Would that stupendous ray be hurled back upon itself? Or would it sear through their makeshift defense,

plunging them and the whole great metropolis into oblivion?

Suddenly, cataclysmically, the answer came.

There burst a withering whirlwind from the disc. It struck that mighty concave cathode of interlaced waves above the city. There followed an instant's clash of titanic forces. Then the cathode triumphed, hurled it back.

Rocked by a concussion as of two worlds in impact, blinded by a glare that made the sunlight seem feeble in comparison. Marjorie and Kendrick clung together, while the disc grew into a satellite of calcium fire in the sky.

Presently, as the conflagration waned, they opened their eyes. Gravely, but with deep thanksgiving, they searched each other's faces. In them they read deep understanding, too, and a new hope.

"I think we'd better go and find father," she said at length, quietly.

"I think so too!" he agreed.

As they headed toward the laboratory, a fine, powdery dust, like volcanic ash was falling.

It continued to fall until the city streets were covered to a depth of an inch or more.

Thus passed the menace of Vada.

September 1930

#46 A Problem In Communication, By Miles John. Breuer, M.D.:

The delivery of his country into the clutches of a merciless, ultra-modern religion can be prevented only by Dr. Hagstrom's deciphering an extraordinary code.

the famous science temple

Part 1: The Science Community

(This part is related by Peter Hagstrom, Ph.D.)

"The Ability to communicate ideas from one individual to another," said a professor of sociology to his class, "is the principal distinction between human beings and their brute forbears. The increase and refinement of this ability to communicate is an index of the degree of civilization of a people. The more civilized a people, the more perfect their ability to communicate,

especially under difficulties and in emergencies."

The delivery of his country into the clutches of a merciless, ultra-modern religion can be prevented only by Dr. Hagstrom's deciphering an extraordinary code.

As usual, the observation burst harmlessly over the heads of most of the students in the class, who were preoccupied with more immediate things—with the evening's movies and the week-end's dance. But upon two young men in the class, it made a powerful impression. It crystallized within them certain vague conceptions and brought them to a conscious focus, enabling the young men to turn formless dreams into concrete acts. That is why I take the position that the above enthusiastic words of this sociology professor, whose very name I have forgotten, were the prime moving influence which many years later succeeded in saving Occidental civilization from a catastrophe which would have been worse than death and destruction.

One of these young men was myself, and the other

was my lifelong friend and chum, Carl Benda, who saved his country by solving a tremendously difficult scientific puzzle in a simple way, by sheer reasoning power, and without apparatus. The sociology professor struck a responsive chord in us: for since our earliest years we had wigwagged to each other as Boy Scouts, learned the finger alphabet of the deaf and dumb so that we might maintain communication during school hours, strung a telegraph wire between our two homes, admired Poe's "Gold Bug" together and devised boyish cipher codes in which to send each other postcards when chance separated us. But we had always felt a little foolish about what we considered our childish hobbies, until the professor's words suddenly roused us to the realization that we were a highly civilized pair of youngsters.

Not only did we then and there cease feeling guilty about our secret ciphers and our dots and dashes, but the determination was born within us to make of communication our life's work. It turned out that both of us actually did devote our lives to the cause of communication; but the passing years saw us

engaged in widely and curiously divergent phases of the work. Thirty years later, I was Professor of the Psychology of Language at Columbia University, and Benda was Maintenance Engineer of the Bell Telephone Company of New York City; and on his knowledge and skill depended the continuity and stability of that stupendously complex traffic, the telephone communication of Greater New York.

Since our ambitious cravings were satisfied in our everyday work, and since now ordinarily available methods of communication sufficed our needs, we no longer felt impelled to signal across the house-tops with semaphores nor to devise ciphers that would defy solution. But we still kept up our intimate friendship and our intense interest in our beloved subject. We were just as close chums at the age of fifty as we had been at ten, and just as thrilled at new advances in communication: at television, at the international language, at the supposed signals from Mars.

That was the state of affairs between us up to a year ago. At about that time Benda resigned his position

with the New York Bell Telephone Company to accept a place as the Director of Communication in the Science Community. This, for many reasons, was a most amazing piece of news to myself and to anyone who knew Benda.

Of course, it was commonly known that Benda was being sought by Universities and corporations: I know personally of several tempting offers he had received. But the New York Bell is a wealthy corporation and had thus far managed to hold Benda, both by the munificence of its salary and by the attractiveness of the work it offered him. That the Science Community would want Benda was easy to understand; but, that it could outbid the New York Bell, was, to say the least, a surprise.

Furthermore, that a man like Benda would want to have anything at all to do with the Science Community seemed strange enough in itself. He had the most practical common sense—well-balanced habits of thinking and living, supported by an intellect so clear and so keen that I knew of none to excel it. What the Science Community was, no one knew

exactly; but that there was something abnormal, fanatical, about it, no one doubted.

The Science Community, situated in Virginia, in the foothills of the Blue Ridge, had first been heard of many years ago, when it was already a going concern. At the time of which I now speak, the novelty had worn off, and no one paid any more attention to it than they do to Zion City or the Dunkards. By this time, the Science Community was a city of a million inhabitants, with a vast outlying area of farms and gardens. It was modern to the highest degree in construction and operation; there was very little manual labor there; no poverty; every person had all the benefits of modern developments in power, transportation, and communication, and of all other resources provided by scientific progress.

So much, visitors and reporters were able to say.

The rumors that it was a vast socialistic organization, without private property, with equal sharing of all privileges, were never confirmed. It is a curious observation that it was possible, in this country of

ours, for a city to exist about which we knew so little. However, it seemed evident from the vast number and elaboration of public buildings, the perfection of community utilities such as transportation, streets, lighting, and communication, from the absence of individual homes and the housing of people in huge dormitories, that some different, less individualistic type of social organization than ours was involved. It was obvious that as an organization, the Science Community must also be wealthy. If any of its individual citizens were wealthy, no one knew it.

I knew Benda as well as I knew myself, and if I was sure of anything in my life, it was that he was not the type of man to leave a fifty thousand dollar job and join a communist city on an equal footing with the clerks in the stores. As it happens, I was also intimately acquainted with John Edgewater Smith, recently Power Commissioner of New York City and the most capable power engineer in North America, who, following Benda by two or three months, resigned his position, and accepted what his letter termed the place of Director of Power in the Science

Community. I was personally in a position to state that neither of these men could be lightly persuaded into such a step, and that neither of them would work for a small salary.

Benda's first letter to me stated that he was at the Science Community on a visit. He had heard of the place, and while at Washington on business had taken advantage of the opportunity to drive out and see it. Fascinated by the equipment he saw there, he had decided to stay a few days and study it. The next letter announced his acceptance of the position. I would give a month's salary to get a look at those letters now; but I neglected to preserve them. I should like to see them because I am curious as to whether they exhibit the characteristics of the subsequent letters, some of which I now have.

As I have stated, Benda and I had been on the most intimate terms for forty years. His letters had always been crisp and direct, and thoroughly familiar and confidential. I do not know just how many letters I received from him from the Science Community before I noted the difference, but I have one from the

third month of his stay there (he wrote every two or three weeks), characterized by a verbosity that sounded strange for him. He seemed to be writing merely to cover the sheet, trifles such as he had never previously considered worth writing letters about. Four pages of letter conveyed not a single idea. Yet Benda was, if anything, a man of ideas.

There followed several months of letters like that: a lot of words, evasion of coming to the point about anything; just conventional letters. Benda was the last man to write a conventional letter. Yet, it was Benda writing them: gruff little expressions of his, clear ways of looking at even the veriest trifles, little allusion to our common past: these things could neither have been written by anyone else, nor written under compulsion from without. Something had changed Benda.

I pondered on it a good deal, and could think of no hypothesis to account for it. In the meanwhile, New York City lost a third technical man to the Science Community. Donald Francisco, Commissioner of the Water Supply, a sanitary engineer of international

standing, accepted a position in the Science Community as Water Director. I did not know whether to laugh and compare it to the National Baseball League's trafficking in "big names," or to hunt for some sinister danger sign in it. But, as a result of my ponderings, I decided to visit Benda at The Science Community.

I wrote him to that effect, and almost decided to change my mind about the visit because of the cold evasiveness of the reply I received from him. My first impulse on reading his indifferent, lackadaisical comment on my proposed visit was to feel offended, and determine to let him alone and never see him again. The average man would have done that, but my long years of training in psychological interpretation told me that a character and a friendship built during forty years does not change in six months, and that there must be some other explanation for this. I wrote him that I was coming. I found that the best way to reach the Science Community was to take a bus out from Washington. It involved a drive of about fifty miles northwest, through a picturesque section of the

country. The latter part of the drive took me past settlements that looked as though they might be in about the same stage of progress as they had been during the American Revolution. The city of my destination was back in the hills, and very much isolated. During the last ten miles we met no traffic at all, and I was the only passenger left in the bus. Suddenly the vehicle stopped.

"Far as we go!" the driver shouted.

I looked about in consternation. All around were low, wild-looking hills. The road went on ahead through a narrow pass.

"They'll pick you up in a little bit," the driver said as he turned around and drove off, leaving me standing there with my bag, very much astonished at it all.

He was right. A small, neat-looking bus drove through the pass and stopped for me. As I got in, the driver mechanically turned around and drove into the hills again.

"They took up my ticket on the other bus," I said to the driver. "What do I owe you?"

"Nothing," he said curtly. "Fill that out." He handed me a card.

An impertinent thing, that card was. Besides asking for my name, address, nationality, vocation, and position, it requested that I state whom I was visiting in the Science Community, the purpose of my visit, the nature of my business, how long I intended to stay, did I have a place to stay arranged for, and if so, where and through whom. It looked for all the world as though they had something to conceal; Czarist Russia couldn't beat that for keeping track of people and prying into their business. Sign here, the card said.

It annoyed me, but I filled it out, and, by the time I was through, the bus was out of the hills, traveling up the valley of a small river; I am not familiar enough with northern Virginia to say which river it was. There was much machinery and a few people in the broad fields. In the distance ahead was a mass of

chimneys and the cupolas of iron-works, but no smoke.

There were power-line towers with high-tension insulators, and, far ahead, the masses of huge elevators and big, square buildings. Soon I came in sight of a veritable forest of huge windmills.

In a few moments, the huge buildings loomed up over me; the bus entered a street of the city abruptly from the country. One moment on a country road, the next moment among towering buildings. We sped along swiftly through a busy metropolis, bright, airy, efficient looking. The traffic was dense but quiet, and I was confident that most of the vehicles were electric; for there was no noise nor gasoline odor. Nor was there any smoke. Things looked airy, comfortable, efficient; but rather monotonous, dull. There was a total lack of architectural interest. The buildings were just square blocks, like neat rows of neat boxes. But, it all moved smoothly, quietly, with wonderful efficiency.

My first thought was to look closely at the people who swarmed the streets of this strange city. Their faces were solemn, and their clothes were solemn. All seemed intently busy, going somewhere, or doing something; there was no standing about, no idle sauntering. And look whichever way I might, everywhere there was the same blue serge, on men and women alike, in all directions, as far as I could see.

The bus stopped before a neat, square building of rather smaller size, and the next thing I knew, Benda was running down the steps to meet me. He was his old gruff, enthusiastic self.

"Glad to see you, Hagstrom, old socks!" he shouted, and gripped my hand with two of his. "I've arranged for a room for you, and we'll have a good old visit, and I'll show you around this town."

I looked at him closely. He looked healthy and well cared-for, all except for a couple of new lines of worry on his face. Undoubtedly that worn look meant some sort of trouble.

Part 2: The New Religion

(This part is interpolated by the author into Dr. Hagstrom's narrative.)

Every great religion has as its psychological reason for existence the mission of compensating for some crying, unsatisfied human need. Christianity spread and grew among people who were, at the time, persecuted subjects or slaves of Rome; and it flourished through the Middle Ages at a time when life held for the individual chiefly pain, uncertainty, and bereavement. Christianity kept the common man consoled and mentally balanced by minimizing the importance of life on earth and offering compensation afterwards and elsewhere.

A feeble nation of idle dreamers, torn by a chaos of intertribal feuds within, menaced by powerful, conquest-lusting nations from without, Arabia was enabled by Islam, the religion of her prophet Mohammed, to unite all her sons into an intense loyalty to one cause, and to turn her dream-stuff into reality by carrying her national pride and honor

beyond her boundaries and spreading it over half the known world.

The ancient Greeks, in despair over the frailties of human emotion and the unbecomingness of worldly conduct, which their brilliant minds enabled them to recognize clearly but which they found themselves powerless to subdue, endowed the gods, whom they worshipped, with all of their own passions and weaknesses, and thus the foolish behavior of the gods consoled them for their own obvious shortcomings. So it goes throughout all of the world's religions.

In the middle of the twentieth century there were in the civilized world, millions of people in whose lives Christianity had ceased to play any part. Yet, psychically—remember, "psyche" means "soul"—they were just as sick and unbalanced, just as much in need of some compensation as were the subjects of the early Roman empire, or the Arabs in the Middle Ages. They were forced to work at the strained and monotonous pace of machines; they were the slaves, body and soul, of machines; they lived with machines and lived like machines—they were expected to *be*

machines. A mechanized mode of life set a relentless pace for them, while, just as in all the past ages, life and love, the breezes and the blue sky called to them; but they could not respond. They had to drive machines so that machines could serve them. Minds were cramped and emotions were starved, but hands must go on guiding levers and keeping machines in operation. Lives were reduced to such a mechanical routine that men wondered how long human minds and human bodies could stand the restraint. There is a good deal in the writings of the times to show that life was becoming almost unbearable for three-fourths of humanity.

It is only natural, therefore, that Rohan, the prophet of the new religion, found followers more rapidly than he could organize them. About ten years before the visit of Dr. Hagstrom to his friend Benda, Rohan and his new religion had been much in the newspapers. Rohan was a Slovak, apparently well educated in Europe. When he first attracted attention to himself, he was foreman in a steel plant at Birmingham,

Alabama. He was popular as an orator, and drew unheard-of crowds to his lectures.

He preached of *Science* as God, an all-pervading, inexorably systematic Being, the true Center and Motive-Power of the Universe; a Being who saw men and pitied them because they could not help committing inaccuracies. The Science God was helping man become more perfect. Even now, men were much more accurate and systematic than they had been a hundred years ago; men's lives were ordered and rhythmic, like natural laws, not like the chaotic emotions of beasts and savages.

Somehow, he soon dropped out of the attention of the great mass of the public. Of course, he did so intentionally, when his ideas began to crystallize and his plans for his future organization began to form. At first he had a sort of church in Birmingham, called The Church of the Scientific God. There never was anything cheap nor blatant about him. When he moved his church from Birmingham to the Lovett Branch Valley in northern Virginia, he was hardly noticed. But with him went seven thousand people, to

form the nucleus of the Science Community.

Since then, some feature writer for a metropolitan Sunday paper has occasionally written up the Science Community, both from its physical and its human aspects. From these reports, the outstanding bit of evidence is that Rohan believes intensely in his own religion, and that his followers are all loyal worshippers of the Science God. They conceive the earth to be a workshop in which men serve Science, their God, serving a sort of apprenticeship during which He perfects them to the state of ideal machines. To be a perfect machine, always accurate, with no distracting emotions, no getting off the track—that was the ideal which the Great God *Science* required of his worshippers. To be a perfect machine, or a perfect cog in a machine, to get rid of all individuality, all disturbing sentiment, that was their idea of supreme happiness. Despite the obvious narrowness it involved, there was something sublime in the conception of this religion. It certainly had nothing in common with the "Christian Science" that was in vogue during the early years of the twentieth

Century; it towered with a noble grandeur above that feeble little sham.

The Science Community was organized like a machine: and all men played their parts, in government, in labor, in administration, in production, like perfect cogs and accurate wheels, and the machine functioned perfectly. The devotees were described as fanatical, but happy. They certainly were well trained and efficient. The Science Community grew. In ten years it had a million people, and was a worldwide wonder of civic planning and organization; it contained so many astonishing developments in mechanical service to human welfare and comfort that it was considered as a sort of model of the future city. The common man there was provided with science-produced luxuries, in his daily life, that were in the rest of the world the privilege of the wealthy few—but he used his increased energy and leisure in serving the more devotedly, his God, Science, who had made machines. There was a great temple in the city, the shape of a huge dynamo-generator, whose interior was worked out in a scheme of mechanical

devices, and with music, lights, and odors to help in the worship.

What the world knew the least about was that this religion was becoming militant. Its followers spoke of the heathen without, and were horrified at the prevalence of the sin of individualism. They were inspired with the mission that the message of God—scientific perfection—must be carried to the whole world. But, knowing that vested interests, governments, invested capital, and established religions would oppose them and render any real progress impossible, they waited. They studied the question, looking for some opportunity to spread the gospel of their beliefs, prepared to do so by force, finding their justification in their belief that millions of sufferers needed the comforts that their religion had given them. Meanwhile their numbers grew.

Rohan was Chief Engineer, which position was equal in honor and dignity to that of Prophet or High Priest. He was a busy, hard-worked man, black haired and

gaunt, small of stature and fiery eyed; he looked rather like an overworked department-store manager rather than like a prophet. He was finding his hands more full every day, both because of the extraordinary fertility of his own plans and ideas, and because the Science Community was growing so rapidly. Among this heterogenous mass of proselyte strangers that poured into the city and was efficiently absorbed into the machine, it was yet difficult to find executives, leaders, men to put in charge of big things. And he needed constantly more and more of such men.

That was why Rohan went to Benda, and subsequently to others like Benda. Rohan had a deep knowledge of human nature. He did not approach Benda with the offer of a magnanimous salary, but came into Benda's office asking for a consultation on some of the puzzling communication problems of the Science Community. Benda became interested, and on his own initiative offered to visit the Science Community, saying that he had to be in Washington anyway in a few days. When he saw what the

conditions were in the Science Community, he became fascinated by its advantages over New York; a new system to plan from the ground up; no obsolete installation to wrestle with; an absolutely free hand for the engineer in charge; no politics to play; no concessions to antiquated city construction, nor to feeble-minded city administration—just a dream of an opportunity. He almost asked for the job himself, but Rohan was tactful enough to offer it, and the salary, though princely, was hardly given a thought.

For many weeks Benda was absorbed in his job, to the exclusion of all else. He sent his money to his New York bank and had his family move in and live with him. He was happy in his communication problems.

"Give me a problem in communication and you make me happy," he wrote to Hagstrom in one of his early letters.

He had completed a certain division of his work on the Science Community's communication system, and it occurred to him that a few days' relaxation would do him good. A run up to New York would be just the

thing.

To his amazement, he was not permitted to board the outbound bus.

"You'll need orders from the Chief Engineer's office," the driver said.

Benda went to Rohan.

"Am I a prisoner?" he demanded with his characteristic directness.

"An embarrassing situation," the suave Rohan admitted, very calmly and at his ease. "You see, I'm nothing like a dictator here. I have no arbitrary power. Everything runs by system, and you're a sort of exception. No one knows exactly how to classify you. Neither do I. But, I can't break a rule. That is sin."

"What rule? I want to go to New York."

"Only those of the Faith who have reached the third

degree can come and go. No one can get that in less than three years."

"Then you got me in here by fraud?" Benda asked bluntly.

Rohan side-stepped gracefully.

"You know our innermost secrets now," he explained. "Do you suppose there is any hope of your embracing the Faith?"

Benda whirled on his heel and walked out.

"I'll think about it!" he said, his voice snapping with sarcasm.

Benda went back to his work in order to get his mind off the matter. He was a well-balanced man if he was anything; and he knew that nothing could be accomplished by rash words or incautious moves against Rohan and his organization. And on that day he met John Edgewater Smith.

"You here?" Benda gasped. He lost his equilibrium for a moment in consternation at the sight of his fellow-engineer.

Smith was too elated to notice Benda's mood.

"I've been here a week. This is certainly an ideal opportunity in my line of work. Even in Heaven I never expected to find such a chance."

By this time Benda had regained control of himself. He decided to say nothing to Smith for the time being.

They did not meet again for several weeks. In the meantime Benda discovered that his mail was being censored. At first he did not know that his letters, always typewritten, were copied and objectionable matter omitted, and his signature reproduced by the photo-engraving process, separately each time. But before long, several letters came back to him rubber-stamped: "Not passable. Please revise." It took Benda two days to cool down and rewrite the first letter. But outwardly no one would have ever known that there

was anything amiss with him.

However, he took to leaving his work for an hour or two a day and walking in the park, to think out the matter. He didn't like it. This was about the time that it began to be a real issue as to who was the bigger man of the two, Rohan or Benda. But no signs of the issue appeared externally for many months.

John Edgewater Smith realized sooner than Benda that he couldn't get out, because, not sticking to work so closely, he had made the attempt sooner. He looked very much worried when Benda next saw him.

"What's this? Do you know about it?" he shouted as soon as he had come within hearing distance of Benda.

"What's the difference?" Benda replied casually.
"Aren't you satisfied?"

Smith's face went blank.

Benda came close to him, linked arms and led him to

a broad vacant lawn in the park.

"Listen!" he said softly in Smith's ear. "Don't you suppose these people who lock us in and censor our mail aren't smart enough to spy on what we say to each other?"

"Our only hope," Benda continued, "is to learn all we can of what is going on here. Keep your eyes and ears open and meet me here in a week. And now come on; we've been whispering here long enough."

Oddly enough, the first clue to the puzzle they were trying to solve was supplied by Francisco, New York's former Water Commissioner. Why were they being kept prisoners in the city? There must be more reason for holding them there than the fear that information would be carried out, for none of the three engineers knew anything about the Science Community that could be of any possible consequence to outsiders. They had all stuck rigidly to their own jobs.

They met Francisco, very blue and dejected, walking in the park a couple of months later. They had been having weekly meetings, feeling that more frequent rendezvous might excite suspicion. Francisco was overjoyed to see them.

"Been trying to figure out why they want us," he said. "There is something deeper than the excuse they have made; that rot about a perfect system and no breaking of rules may be true, but it has nothing to do with us. Now, here are three of us, widely admitted as having good heads on us. We've got to solve this."

"The first fact to work on," he continued, "is that there is no real job for me here. This city has no water problem that cannot be worked out by an engineer's office clerk. Why are they holding me here, paying me a profligate salary, for a job that is a joke for a grown-up man? There's something behind it that is not apparent on the surface."

The weekly meetings of the three engineers became an established institution. Mindful that their conversation was doubtless the object of attention on

the part of the ruling powers of the city through spies and concealed microphones, they were careful to discuss trivial matters most of the time, and mentioned their problem only when alone in the open spaces of the park.

After weeks of effort had produced no results, they arrived at the conclusion that they would have to do some spying themselves. The great temple, shaped like a dynamo-generator attracted their attention as the first possibility for obtaining information. Benda, during his work with telephone and television installation, found that the office of some sort of ruling council or board of directors were located there. Later he found that it was called the Science Staff. He managed to slip in several concealed microphone detectors and wire them to a private receiver on his desk, doing all the work with his own hands under the pretense of hunting for a cleverly contrived short-circuit that his subordinates had failed to find.

"They open their meeting," he said, reporting several days of listening to his comrades, "with a lot of

religious stuff. They really believe they are chosen by God to perfect the earth. Their fanaticism has the Mohammedans beat forty ways. As I get it from listening in, this city is just a preliminary base from which to carry, forcibly, the gospel of Scientific Efficiency to the whole world. They have been divinely appointed to organize the earth.

"The first thing on the program is the seizure of New York City. And, it won't be long; I've heard the details of a cut-and-dried plan. When they have New York, the rest of America can be easily captured, for cities aren't as independent of each other as they used to be. Getting the rest of the world into their hands will then be merely a matter of routine; just a little time, and it will be done. Mohammed's wars weren't in it with this!"

Francisco and Smith stared at him aghast. These dull-faced, blue-serge clad people did not look capable of it; unless possibly one noted the fiery glint in their eyes. A worldwide Crusade on a scientific basis! The idea left them weak and trembling.

"Got to learn more details before we can do anything," Benda said. "Come on; we've been whispering here long enough; they'll get suspicious." Benda's brain was now definitely pitted against this marvelous organisation.

"I've got it!" Benda reported at a later meeting. "I pieced it together from a few hours listening. Devilish scheme!

"Can you imagine what would happen in New York in case of a break-down in water-supply, electric power, and communication? In an hour there would be a panic; in a day the city would be a hideous shambles of suffering, starvation, disease, and trampling maniacs. Dante's Inferno would be a lovely little pleasure-resort in comparison.

"Also, have you ever stopped to think how few people there are in the world who understand the handling of these vital elements of our modern civilized organization sufficiently to keep them in operation? There you have the scheme. Because they do not want to destroy the city, but merely to threaten it, they are

holding the three of us. A little skilful management will eliminate all other possible men who could operate the city's machinery, except ourselves. We three will be placed in charge. A threat, perhaps a demonstration in some limited section of what horrors are possible. The city is at their mercy, and promptly surrenders.

"An alternative plan was discussed: just a little quiet violence could eliminate those who are now in charge of the city's works, and the panic and horrors would commence. But, within an hour of the city's capitulation, the three of us could have things running smoothly again. And there would be no New York; in its place would be Science Community Number Two. From it they could step on to the next city."

The other two stared at him. There was only one comment.

"They seem to be sure that they could depend on us," Smith said.

"They may be correct," Benda replied. "Would you stand by and see people perish if a turn of your hand could save them? You would for the moment, forget the issue between the old order and the new religion."

They separated, horrified by the ghastly simplicity of the plan.

Just following this, Benda received the telegram announcing the prospective visit of his lifelong friend, Dr. Hagstrom. He took it at once to Rohan.

"Will my friend be permitted to depart again, if he once gets in here?" he demanded with his customary directness.

"It depends on you," Rohan replied blandly. "We want your friend to see our Community, and to go away and carry with him the nicest possible reports and descriptions of it to the world. I wonder, do I make myself clear?"

"That means I've got to feed him taffy while he's here?" Benda asked gruffly.

"You choose to put it indelicately. He is to see and hear only such things about the Science Community as will please the world and impress it favorably. I am sure you will understand that under no other circumstances will he be permitted to leave here."

Benda turned around abruptly and walked out without a word.

"Just a moment," Rohan called after him. "I am sure you appreciate the fact that every precaution will be taken to hear the least word that you say to him during his stay here? You are watched only perfunctorily now. While he is here you will be kept track of carefully, and there will be three methods of checking everything you do or say. I am sure you do not underestimate our caution in this matter."

Benda spent the days intervening between then and the arrival of his friend Hagstrom, closed up in his office, in intense study. He figured things on pieces of paper, committed them to memory, and scrupulously burned the paper. Then he wandered about the park and plucked at leaves and twigs.

Part 3: The Cipher Message

(Related by Peter Hagstrom, Ph.D.)

Benda conducted me personally to a room very much like an ordinary hotel room. He was glad to see me. I could tell that from his grip of welcome, from his pleased face, from the warmth in his voice, from the eager way in which he hovered around me. I sat down on a bed and he on a chair.

"Now tell me all about it," I said.

The room was very still, and in its privacy, following Benda's demonstrative welcome, I expected some confidential revelations. Therefore I was astonished.

"There isn't much to tell," he said gaily. "My work is congenial, fascinating, and there's enough of it to keep me out of mischief. The pay is good, and the life pleasant and easy."

I didn't know what to say for a moment. I had come there with my mind made up that there was

something suspicious afoot. But he seemed thoroughly happy and satisfied.

"I'll admit that I treated you a little shabbily in this matter of letters," he continued. "I suppose it is because I've had a lot of new and interesting problems on my mind, and it's been hard to get my mind down to writing letters. But I've got a good start on my job, and I'll promise to reform."

I was at a loss to pursue that subject any further.

"Have you seen Smith and Francisco?" I asked.

He nodded.

"How do they like it?"

"Both are enthusiastic about the wonderful opportunities in their respective fields. It's a fact: no engineer has ever before had such resources to work with, on such a vast scale, and with such a free hand. We're laying the framework for a city of ten millions, all thoroughly systematized and efficient. There is no

city in the world like it; it's an engineer's dream of Utopia."

I was almost convinced. There was only the tiniest of lurking suspicions that all was not well, but it was not powerful enough to stimulate me to say anything. But I did determine to keep my eyes open.

I might as well admit in advance that from that moment to the time when I left the Science Community four days later, I saw nothing to confirm my suspicions. I met Smith and Francisco at dinner and the four of us occupied a table to ourselves in a vast dining hall, and no one paid for the meal nor for subsequent ones. They also seemed content, and talked enthusiastically of their work.

I was shown over the city, through its neat, efficient streets, through its comfortable dormitories each housing hundreds of families as luxuriously as any modern hotel, through its marvelous factories where production had passed the stage of labor and had assumed the condition of a devoted act of worship. These factory workers were not toiling: they were

worshipping their God, of Whom each machine was a part. Touching their machine was touching their God. This machinery, while involving no new principles, was developed and coordinated to a degree that exceeded anything I had ever seen anywhere else.

I saw the famous Science Temple in the shape of a huge dynamo-generator, with its interior decorations, paintings, carvings, frescoes, and pillars, all worked out on the motive of machinery; with its constant streams of worshippers in blue serge, performing their conventional rites and saying their prayer formulas at altars in the forms of lathes, microscopes, motors, and electron-tubes.

"You haven't become a Science Communist yourself?" I bantered Benda.

There was a metallic ring in the laugh he gave.

"They'd like to have me!" was all he said.

I was rather surprised at the emptiness of the large and well-kept park to which Benda took me. It was

beautifully landscaped, but only a few scattering people were there, lost in its vast reaches.

"These people seem to have no need of recreation," Benda said. "They do not come here much. But I confess that I need air and relaxation, even if only for short snatches. I've been too busy to get away for long at a time, but this park has helped me keep my balance—I'm here every day for at least a few minutes."

"Beautiful place," I remarked. "A lot of strange trees and plants I never saw before—"

"Oh, mostly tropical forms, common enough in their own habitats. They have steam pipes under the ground to grow them. I've been trying to learn something about them. Fancy *me* studying natural history! I've never cared for it, but here, where there is no such thing as recreation, I have become intensely interested in it as a hobby. I find it very much of a rest to study these plants and bugs."

"Why don't you run up to New York for a few days?"

"Oh, the time will come for that. In the meanwhile, I've got an idea all of a sudden. Speaking of New York, will you do me a little service? Even though you might think it silly?"

"I'll do anything I can," I began, eager to be of help to him.

"It has been somewhat of a torture to me," Benda continued, "to find so many of these forms which I am unable to identify. I like to be scientific, even in my play, and reference books on plants and insects are scarce here. Now, if you would carry back a few specimens for me, and ask some of the botany and zoology people to send me their names—"

"Fine!" I exclaimed. "I've got a good-sized pocket notebook I can carry them in."

"Well then, please put them in the order in which I hand them to you, and send me the names by number. I am pretty thoroughly familiar with them, and if you will keep them in order, there is no need for me to keep a list. The first is a blade of this queer grass."

I filed the grass blade between the first two pages of my book.

"The next is this unusual-looking pinnate leaf." He tore off a dry leaflet and handed me a stem with three leaflets irregularly disposed of it.

"Now leave a blank page in your book. That will help me remember the order in which they come."

Next came a flat insect, which, strangely enough, had two legs missing on one side. However, Benda was moving so fast that I had to put it away without comment. He kept darting about and handing me twigs of leaves, little sticks, pieces of bark, insects, not seeming to care much whether they were complete or not; grass-blades, several dagger-shaped locust-thorns, cross-sections of curious fruits, moving so rapidly that in a few moments my notebook bulged widely, and I had to warn him that its hundred leaves were almost filled.

"Well, that ought to be enough," he said with a sigh after his lively exertion. "You don't know how I'll

appreciate your indulging my foolish little whim."

"Say!" I exclaimed. "Ask something of me. This it nothing. I'll take it right over to the Botany Department, and in a few days you ought to have a list of names fit for a Bolshevik."

"One important caution," he said. "If you disturb their order in the book, or even the position on the page, the names you send me will mean nothing to me. Not that it will be any great loss," he added whimsically. "I suppose I've become a sort of fan on this, like the business men who claim that their office work interferes with their golf."

We walked leisurely back toward the big dormitory. It was while we were crossing a street that Benda stumbled, and, to dodge a passing truck, had to catch my arm, and fell against me. I heard his soft voice whisper in my ear:

"Get out of this town as soon as you can!"

I looked at him in startled amazement, but he was

walking along, shaking himself from his stumble, and looking up and down the street for passing trucks.

"As I was saying," he said in a matter-of-fact voice, "we expect to reach the one-and-one-quarter million mark this month. I never saw a place grow so fast."

I felt a great leap of sudden understanding. For a moment my muscles tightened, but I took my cue.

"Remarkable place," I said calmly; "one reads a lot of half-truths about it. Too bad I can't stay any longer."

"Sorry you have to leave," he said, in exactly the right tone of voice. "But you can come again."

How thankful I was for the forty years of playing and working together that had accustomed us to that sort of team-work! Unconsciously we responded to one another's cues. Once our ability to "play together" had saved my life. It was when we were in college and were out on a cross-country hike together; Benda suddenly caught my hand and swung it upward. I recognized the gesture; we were cheerleaders and

worked together at football games, and we had one stunt in which we swung our hands over our heads, jumped about three feet, and let out a whoop. This was the "stunt" that he started out there in the country, where we were by ourselves. Automatically, without thinking, I swung my arms and leaped with him and yelled. Only later did I notice the rattlesnake over which I had jumped. I had not seen that I was about to walk right into it, and he had noticed it too late to explain. A flash of genius suggested the cheering stunt to him.

"*Communication* is a science!" he had said, and that was all the comment there was on the incident.

So now, I followed my cue, without knowing why, nor what it was all about, but confident that I should soon find out. By noon I was on the bus, on my way through the pass, to meet the vehicle from Washington. As the bus swung along, a number of things kept jumbling through my mind: Benda's effusive glee at seeing me, and his sudden turning and bundling me off in a nervous hurry without a word of explanation; his lined and worried face and

yet his insistence on the joys of his work in The Science Community; his obvious desire to be hospitable and play the good host, and yet his evasiveness and unwillingness to chat intimately and discuss important thing as he used to. Finally, that notebook full of odd specimens bulging in my pocket. And the memory of his words as he shook hands with me when I was stepping into the bus:

"Long live the science of communication!" he had said. Otherwise, he was rather glum and silent.

I took out the book of specimens and looked at it. His caution not to disturb the order and position of things rang in my ears. The Science of Communication! Two and two were beginning to make four in my mind. All the way on the train from Washington to New York I could hardly, keep my hands off the book. I had definitely abandoned the idea of hunting up botanists and zoologists at Columbia. Benda was not interested in the names of these things. That book meant something else. Some message. The Science of Communication!

That suddenly explained all the contradictions in his behavior. He was being closely watched. Any attempt to tell me the things he wanted to say would be promptly recognized. He had succeeded brilliantly in getting a message to me. Now, my part was to read it! I felt a sudden sinking within me. That book full of leaves, bugs, and sticks? How could I make anything out of it?

"There's the Secret Service," I thought. "They are skilled in reading hidden messages. It must be an important one, worthy of the efforts of the Secret Service, or he would not have been at such pains to get it to me—

"But no. The Secret Service is skilled at reading hidden messages, but not as skilled as I am in reading my friend's mind. Knowing Benda, his clear intellect, his logical methods, will be of more service in solving this than all the experts of the Secret Service."

I barely stopped to eat dinner when I reached home. I hurried to the laboratory building, and laid out the specimens on white sheets of paper, meticulously

preserving order, position, and spacing. To be on the safe side I had them photographed, asking the photographer to vary the scale of his pictures so that all of the final figures would be approximately the same size. Plate I. shows what I had.

I was all a-tremble when the mounted photographs were handed to me. The first thing I did was to number the specimens, giving each blank space also its consecutive number. Certainly no one could imagine a more meaningless jumble of twigs, leaves, berries, and bugs. How could I read any message out of that?

Yet I had no doubt that the message concerned something of far more importance than Benda's own safety. He had moved in this matter with astonishing skill and breathless caution; yet I knew him to be reckless to the extreme where only his own skill was concerned. I couldn't even imagine his going to this elaborate risk merely on account of Smith and Francisco. Something bigger must be involved.

I stared at the rows of specimens.

"Communication is a science!" Benda had said, and it came back to me as I studied the bent worms and the beetles with two legs missing. I was confident that the solution would be simple. Once the key idea occurred to me I knew I should find the whole thing astonishingly direct and systematic. For a moment I tried to attach some sort of hieroglyphic significance to the specimen forms; in the writing of the American Indians, a wavy line meant water, an inverted V meant a wigwam. But, I discarded that idea in a moment. Benda's mind did not work along the paths of symbolism. It would have to be something mathematical, rigidly logical, leaving no room for guess-work.

No sooner had the key-idea occurred to me than the basic conception underlying all these rows of twigs and bugs suddenly flashed into clear meaning before me. The simplicity of it took my breath away.

"I knew it!" I said aloud, though I was alone. "Very simple."

I was prepared for the fact that each one of the

specimens represented a letter of the alphabet. If nothing else, their number indicated that. Now I could see, so clearly that the photographs shouted at me, that each specimen consisted of an upright stem, and from this middle stem projected side-arms to the right and to the left, and in various vertical locations on each side.

The middle upright stem contained these side-arms in various numbers and combinations. In five minutes I had a copy of the message, translated into its fundamental characters, as shown on Plate II.

Plate I

The first grass-blade was the simple, upright stem; the second, three leaflets on their stem, represented the upright portion with two arms to the left at the top and middle, and one arm to the right at the top; and so on.

That brought the message down to the simple and

straightforward matter of a substitution cipher. I was confident that Benda had no object in introducing any complications that could possibly be avoided, as his sole purpose was to get to me the most readable message without getting caught at it. I recollected now how cautious he had been to hand me no paper, and how openly and obviously he had dropped each specimen into my book; because he knew someone was watching him and expecting him to slip in a message. He had, as I could see now in the retrospect, been conspicuously careful that nothing suspicious should pass from his hands to mine.

Plate II

Substitution ciphers are easy to solve, especially for those having some experience. The method can be found in Edgar Allen Poe's "Gold Bug" and in a host of its imitators. A Secret Service cipher man could have

read it in an hour. But I knew my friend's mind well enough to find a short-cut. I knew just how he would go about devising such a cipher, in fact, how ninety-nine persons out of a hundred with a scientific education would do it.

If we begin adding horizontal arms to the middle stem, from top to bottom and from left to right, the possible characters can be worked out by the system shown on Plate III.

1	7	4	1	7	4	1	3
1	7	4	1	7	4	1	3
1	7	4	1	7	4	1	3
1	7	4	1	7	4	1	3
1	7	4	1	7	4	1	3
1	7	4	1	7	4	1	3
1	7	4	1	7	4	1	3
1	7	4	1	7	4	1	3

Plate III

It is most logical to suppose that Benda would begin with the first sign and substitute the letters of the alphabet in order. That would give us the cipher code shown on Plate IV.

It was all very quick work, just as I had anticipated, once the key-idea had occurred to me. The ease and speed of my method far exceeded that of Poe's method, but, of course, was applicable only to this particular case. Substituting letters for signs out of my diagram, I got the following message:

AM PRISONER R PLANS CAPTURE OF N Y BY
SEIZING POWER WATER AND PHONES THEN
WORLD CONQUEST S O S

I A	7 B	+ C	J D	F E	F F	3 G	E H
7 I	T J	7 K	7 L	7 M	7 N	7 O	7 P
7 Q	7 R	7 S	7 T	7 U	7 V	7 W	7 X
L Y	7 Z	7 1	7 2	7 3	7 4	7 5	7 6
F 7	F 8	F 9	F 0				

Plate IV

Part 4: L'Envoi

(By Peter Hagstrom, M.D.)

My solution of the message practically ends the story. Events followed each other from then on like bullets from a machine-gun. A wild drive in a taxicab brought me to the door of Mayor Anderson at ten o'clock that night. I told him the story and showed him my photographs.

Following that I spent many hours telling my story to and consulting with officers in the War Department. Next afternoon, photographic maps of the Science Community and its environs, brought by airplanes during the forenoon, were spread on desks before us. A colonel of marines and a colonel of aviation sketched plans in notebooks. After dark I sat in a transport plane with muffled exhaust and propellers, slipping through the air as silently as a hawk. About us were a dozen bombing planes, and about fifty transports, carrying a battalion of marines.

I am not an adventure-loving man. Though a cordon

of husky marines about me was a protection against any possible danger, yet, stealing along through that wild valley in the Virginia mountains toward the dark masses of that fanatic city, the silent progress of the long, dark line through the night, their mysterious disappearance, one by one, as we neared the city, the creepy, hair-raising journey through the dark streets—I shall never forget for the rest of my life the sinking feeling in my abdomen and the throbbing in my head. But I wanted to be there, for Benda was my lifelong friend.

I guided them to Rohan's rooms, and saw a dozen dark forms slip in, one by one. Then we went on to the dormitory where Benda lived. Benda answered our hammering at his door in his pajamas. He took in the Captain's automatic, and the bayonets behind me, at a glance.

"Good boy, Hagstrom!" he said. "I knew you'd do it. There wasn't much time left. I got my instructions about handling the New York telephone system today."

As we came out into the street. I saw Rohan handcuffed to two big marines, and rows of bayonets gleaming in the darkness down the streets. Every few moments a bright flare shot out from the planes in the sky, until a squad located the power-house and turned on all the lights they could find.

#47 Jetta Of The Lowlands, By Ray Cummings:

Fantastic and sinister are the lowlands into which Philip Grant descends on his dangerous assignment.

Foreword

Have you ever stood on the seashore, with the

breakers rolling at your feet, and imagined what the scene would be like if the ocean water were gone? I have had a vision of that many times. Standing on the Atlantic Coast, gazing out toward Spain, I can envisage myself, not down at the sea-level, but upon the brink of a height. Spain and the coast of Europe, off there upon another height.

Fantastic and sinister are the Lowlands into which Philip Grant descends on his dangerous assignment.

And the depths between? Unreal landscape!
Mysterious realm which now we call the bottom of the sea! Worn and rounded crags; bloated mud-plains; noisome reaches of ooze which once were the cold and dark and silent ocean floor, caked and drying in the sun. And off to the south the little fairy mountain tops of the West Indies rearing their verdured crowns aloft.

"Look around, Chief. See where I am?"

If the ocean water were gone! Can you picture it? A new world, greater in area than all the land we now

have. They would call the former sea-level the zero-height, perhaps. The depths would go down as far beneath it as Mount Everest towers above it.

Aeroplanes would fly down into them.

And I can imagine the settlement of these vast new realms: New little nations being created, born of man's indomitable will to conquer every adverse condition of inhospitable nature.

A novel setting for a story of adventure. It seems so to me. Can you say that the oceans will never drain of their water? That an earthquake will not open a rift—some day in the future—and lower the water into subterranean caverns? The volume of water of all the oceans is no more to the volume of the earth than a tissue paper wrapping on an orange.

Is it too great a fantasy? Why, reading the facts of what happened in 1929, it is already prognosticated. The fishing banks off the Coast of Newfoundland have suddenly sunk. Cable ships repairing a broken cable, snapped by the earthquake of November 18th, 1929, report that for distances of a hundred miles on the

Grand Banks the cables have disappeared into unfathomable depths. And before the subterranean cataclysm, they were within six hundred feet of the surface. And all the bottom of that section of the North Atlantic seems to have caved in. Ten thousand square miles dropped out of the bottom of the ocean! Fact, not fancy.

And so let us enlarge the picture. Let us create the Lowlands—twenty thousand feet below the zero-height—the setting for a tale of adventure. The romance of the mist-shrouded deeps. And the romance of little Jetta.

Chapter 1: The Secret Mission

I was twenty-five years of age that May evening of 2020 when they sent me south into the Lowlands. I had been in the National Detective Service Bureau, and then was transferred to the Customs Department, Atlantic Lowlands Branch. I went alone; it was best, my commander thought. An assignment needing diplomacy rather than a show of force.

It was 9 P. M. when I catapulted from the little stage of Long Island airport. A fair, moonlit evening—a moon just beyond the full, rising to pale the eastern stars. I climbed about a thousand feet, swung over the headlands of the Hook, and, keeping in the thousand-foot local lane, took my course.

My destination lay some thirteen hundred miles southeast of Great New York. I could do a good normal three-ninety in this fleet little Wasp, especially if I kept in the rarer air-pressures over the zero-height. The thousand-foot lane had a southward drift, this night. I was making now well over four hundred; I would reach Nareda soon after midnight.

The Continental Shelf slid beneath me, dropping away as my course took me further from the Highland borders. The Lowlands lay patched with inky shadows and splashes of moonlight. Domes with upstanding, rounded heads; plateaus of naked black rock, ten thousand feet below the zero-height; trenches, like valleys, ridged and pitted, naked in places like a pockmarked lunar landscape. Or again, a pall of black mist would shroud it all, dark curtain of sluggish cloud with moonlight tinging its edges pallid green.

To my left, eastward toward the great basin of the mid-Atlantic Lowlands, there was always a steady downward slope. To the right, it came up over the continental shelf to the Highlands of the United States.

There was often water to be seen in these Lowlands. A spring-fed lake far down in a caldron pit, spilling into a trench; low-lying, land-locked little seas; cañons, some of them dry, others filled with tumultuous flowing water. Or great gashes with water sluggishly flowing, or standing with a heavy slime, and a pall of uprising vapor in the heat of the night.

At 37°N. and 70°W., I passed over the newly named Atlas Sea. A lake of water here, more than a hundred miles in extent. Its surface lay fifteen thousand feet below the zero-height; its depth in places was a full three thousand. It was clear of mist to-night. The moonlight shimmered on its rippled surface, like pictures my father had often shown me of the former oceans.

I passed, a little later, well to the westward of the verdured mountain top of the Bermudas.

There was nothing of this flight novel to me. I had frequently flown over the Lowlands; I had descended into them many times. But never upon such a mission as was taking me there now.

I was headed for Nareda, capital village of the tiny Lowland Republic of Nareda, which only five years ago came into national being as a protectorate of the United States. Its territory lies just north of the mountain Highlands of Haiti, Santo Domingo and Porto Rico. A few hundred miles of tumbled Lowlands, embracing the turgid Nares Sea, whose bottom is the

lowest point of all the Western Hemisphere—some thirty thousand feet below the zero-height.

The village of Nareda is far down indeed. I had never been there. My charts showed it on the southern border of the Nares Sea, at minus twenty thousand feet, with the Mona Valley behind it like a gash in the steep upward slopes to the Highlands of Porto Rico and Haiti.

Nareda has a mixed population of typical Lowland adventures, among which the hardy Dutch predominate; and Holland and the United States have combined their influence in the World Court to give it national identity.

And out of this had arisen my mission now. Mercury—the quicksilver of commerce—so recently come to tremendous value through its universal use in the new antiseptics which bid fair to check all human disease—was being produced in Nareda. The import duty into the United States was being paid openly enough. But nevertheless Hanley's agents believed that smuggling was taking place.

It was to investigate this condition that Hanley was sending me. I had introduction to the Nareda government officials. I was to consult with Hanley by ether-phone in seeking the hidden source of the contraband quicksilver, but, in the main, to use my own judgment.

A mission of diplomacy. I had no mind to pry openly among the people of these Lowland depths, looking for smugglers. I might, indeed, find them too unexpectedly! Over-curious strangers are not welcomed by the Lowlanders. Many have gone into the depths and have never returned....

I was above the Nares Sea, by midnight. I was still flying a thousand feet over the zero-height. Twenty-one thousand feet below me lay the black expanse of water. The moon had climbed well toward the zenith, now. Its silver shafts penetrated the hanging mist-stratas. The surface of the Nares Sea was visible—dark and sullen looking.

I shifted the angles of incidence of the wings, re-set my propeller angles and made the necessary

carburetor adjustments, switching on the supercharger which would supply air at normal zero-height pressure to the carburetors throughout my descent.

I swung over Nareda. The lights of the little village, far down, dwarfed by distance, showed like bleary, winking eyes through the mists. The jagged recesses of the Mona valley were dark with shadow. The Nares Sea lay like some black monster asleep, and slowly, heavily panting. Moonlight was over me, with stars and fleecy white clouds. Calm, placid, atmospheric night was up here. But beneath, it all seemed so mysterious, fantastic, sinister.

My heart was pounding as I put the Wasp into a spiral and forced my way down.

Chapter 2: The Face at the Window

With heavy, sluggish engines I panted down and came to rest in the dull yellow glow of the field lights. A new world here. The field was flat, caked ooze, cracked and hardened. It sloped upward from the shore toward where, a quarter of a mile away, I could see the dull lights of the settlement, blurred by the gathered night vapors.

The field operator shut off his permission signal and came forward. He was a squat, heavy-set fellow in wide trousers and soiled white shirt flung open at his thick throat. The sweat streamed from his forehead. This oppressive heat! I had discarded my flying garb in the descent. I wore a shirt, knee-length pants, with hose and wide-soled shoes of the newly fashioned Lowland design. What few weapons I dared carry were carefully concealed. No alien could enter Nareda bearing anything resembling a lethal weapon.

My wide, thick-soled shoes did not look suspicious for one who planned much walking on the caked Lowland ooze. But those fat soles were cleverly fashioned to

hide a long, keen knife-blade, like a dirk. I could lift a foot and get the knife out of its hidden compartment with fair speed. This I had in one shoe.

In the other, was the small mechanism of a radio safety recorder and image finder, with its attendant individual audiophone transmitter and receiver. A miracle of smallness, these tiny contrivances. With batteries, wires and grids, the whole device could lay in the palm of one's hand. Once past this field inspection I would rig it for use under my shirt, strapped around my chest. And I had some colored magnesium flares.

The field operator came panting.

"Who are you?"

"Philip Grant. From Great New York." I showed him my name etched on my forearm. He and his fellows searched me, but I got by.

"You have no documents?"

"No."

My letter to the President of Nareda was written with invisible ink upon the fabric of my shirt. If he had heated it to a temperature of 180°F. or so, and blown the fumes of hydrochloric acid upon it, the writing would have come out plain enough.

I said, "You'll house and care for my machine?"

They would care for it. They told me the price—swindlingly exorbitant for the unwary traveller who might wander down here.

"All correct," I said cheerfully. "And half that much more for you and your men if you give me good service. Where can I have a room and meals?"

"Spawn," said the operator. "He is the best. Fat-bellied from his own good cooking. Take him there, Hugo."

I had a gold coin instantly ready; and with a few additional directions regarding my flyer, I started off.

It had been hot and oppressive standing in the field; it was infinitely worse climbing the mud-slope into the village; but my carrier, trudging in advance of me along the dark, winding path up the slope, shouldered my bag and seemed not to notice the effort. We passed occasional tube-lights strung on poles. They illumined the heavy rounded crags. A tumbled region, this slope which once was the ocean floor twenty thousand feet below the surface. Rifts were here like gulleys; little buttes reared their rounded, dome heads. And there were caves and crevices in which deep sea fish once had lurked.

For ten minutes or so we climbed. It was past the midnight hour; the village was asleep. We entered its outposts. The houses were small structures of clay. In the gloom they looked like drab little beehives set in unplanned groups, with paths for streets wandering between them.

Then we came to a more prosperous neighborhood. The street widened and straightened. The clay houses, still with rounded dome like tops, stood back from the road, with wooden front fences, and gardens and shrubbery. The windows and doors were like round finger-holes plugged in the clay by a giant hand. Occasionally the windows, dimly lighted, stared like sleeping giant eyes.

There were flowers in all the more pretentious private gardens. Their perfume, hanging in the heavy night air, lay on the village, making one forget the over-curtain of stenching mist. Down by the shore of the Nares Sea, this world of the depths had seemed darkly sinister. But in the village now, I felt it less ominous. The scent of the flowers, the street lined in one place by arching giant fronds drowsing and nodding overhead—there seemed a strange exotic romance to it. The sultry air might almost have been sensuous.

"Much further, Hugo?"

"No. We are here."

He turned abruptly into a gateway, led me through a garden and to the doorway of a large, rambling, one-story building. The news of my coming had preceded me. A front room was lighted; my host was waiting.

Hugo set down my bag, accepted another gold coin; and with a queer sidelong smile, the incentive for which I had not the slightest idea, he vanished. I fronted my host, this Jacob Spawn. Strange fate that should have led me to Spawn! And to little Jetta!

Spawn was a fat-bellied Dutchman, as the field attendant had said. A fellow of perhaps fifty-five, with sparse gray hair and a heavy-jowled, smooth-shaved face from which his small eyes peered stolidly at me. He laid aside a huge, old-fashioned calabash pipe and offered a pudgy hand.

"Welcome, young man, to Nareda. Seldom do we see strangers."

The meal which he presently cooked and served me

himself was lavishly done. He spoke good English, but slowly, heavily, with the guttural intonation of his race. He sat across the table from me, puffing his pipe while I ate.

"What brings you here, young lad? A week, you say?"

"Or more. I don't know. I'm looking for oil. There should be petroleum beneath these rocks."

For an hour I avoided his prying questions. His little eyes roved me, and I knew he was no fool, this Dutchman, for all his heavy, stolid look.

We remained in his kitchen. Save for its mud walls, its concave, dome-roof, it might have been a cookery of the Highlands. There was a table with its tube-light; the chairs; his electron stove; his orderly rows of pots and pans and dishes on a broad shelf.

I recall that it seemed to me a woman's hand must be here. But I saw no woman. No one, indeed, beside Spawn himself seemed to live here. He was reticent of his own business, however much he wanted to pry

into mine.

I had felt convinced that we were alone. But suddenly I realized it was not so. The kitchen adjoined an interior back-garden. I could see it through the opened door oval—a dim space of flowers; a little path to a pergola; an adobe fountain. It was a sort of Spanish patio out there, partially enclosed by the wings of the house. Moonlight was struggling into it. And, as I gazed idly, I thought I saw a figure lurking. Someone watching us.

Was it a boy, observing us from the shadowed moonlit garden? I thought so. A slight, half grown boy. I saw his figure—in short ragged trousers and a shirt-blouse—made visible in a patch of moonlight as he moved away and entered the dark opposite wing of the house.

I did not see the boy's figure again; and presently I suggested that I retire. Spawn had already shown me my bedroom. It was in another wing of the house. It

had a window facing the front; and a window and door back to this same patio. And a door to the house corridor.

"Sleep well, Meester Grant." My bag was here on the table under an electrolier. "Shall I call you?"

"Yes," I said. "Early."

He lingered a moment. I was opening my bag. I flung it wide under his gaze.

"Well, good night. I shall be very comfortable, thanks."

"Good night," he said.

He went out the patio door. I watched his figure cross the moonlit path and enter the kitchen. The noise of his pattering there sounded for a time. Then the light went out and the house and garden fell into silence.

I closed my doors. They sealed on the inside, and I fastened them securely. Then I fastened the

transparent window panes. I did not undress, but lay on the bed in the dark. I was tired; I realized it now. But sleep would not come.

I am no believer in occultism, but there are premonitions which one cannot deny. It seemed now as I lay there in the dark that I had every reason to be perturbed, yet I could not think why. Perhaps it was because I had been lying to this innkeeper stoutly for an hour past, and whether he believed me or not for the life of me I could not now determine.

I sat up on the bed, presently, and adjusted the wires and diaphragms of the ether-wave mechanism. When in place it was all concealed under my shirt. As I switched it on, the electrodes against my flesh tingled a little. But it was absolutely soundless, and one gets used to the tingle. I decided to call Hanley.

The New York wave-sorter handled me promptly, but Hanley's office was dead.

As I sat there in the darkness, annoyed at this, a slight noise forced itself on me. A scratching—a tap—something outside my window.

Spawn, come back to peer in at me?

I slipped noiselessly from the bed. The sound had come from the window which faced the patio. The room, over by the bed, was wholly dark. The moonlight outside showed the patio window as a dimly illumined oval.

For a moment I crouched on the floor by the bed. No sound. The silence of the Lowlands is as heavy and oppressive as its air. I felt as though my heart were audible.

I lifted my foot; extracted my dirk. It opened into a very businesslike steel blade of a good twelve-inch length. I bared the blade. The click of it leaving the flat, hollow handle sounded loud in the stillness of the room.

A moment. Then it seemed that outside my window a

shadow had moved. I crept along the floor. Rose up suddenly at the window.

And stared at a face peering in at me. A small face, framed by short, clustering, dark curls.

A girl!

Chapter 3: In a Moonlit Garden

She drew back from the window like a startled fawn; timorous, yet curious, too, for she ran only a few steps, then turned and stood peering. The moonlight slanted over the western roof of the building and fell on her. A slight, boyish figure in short, tattered trousers and a boy's shirt, open at her slim, rounded throat. The moonlight gleamed on the white shirt fabric to show it torn and ragged. Her arms were upraised; her head, with clustering, flying dark curls, was tilted as though listening for a sound from me. A shy, wild creature. Drawn to my window; tapping to awaken me, then frightened at what she had done.

I opened the garden door. She did not move. I thought she would run, but she did not. The moonlight was on me as I stood there. I was conscious of its etching me with its silver sheen. And twenty feet from me this girl stood and gazed, with startled eyes and parted lips—and white limbs trembling like a frightened animal.

The patio was very silent. The heavy arching fronds

stirred slightly with a vague night breeze; the moonlight threw a lacy dark pattern of them on the gray stone path. The fountain bowl gleamed white in the moonlight behind the girl, and in the silence I could hear the low splashing of the water.

A magic moment. Unforgettable. It comes to some of us just once, but to all of us it comes. I stood with its spell upon me. Then I heard my voice, tense but softly raised.

"Who are you?"

It frightened her. She retreated until the fountain was between us. And as I took a step forward, she retreated further, noiseless, with her bare feet treading the smooth stones the path.

I ran and caught her at the doorway of the flowered pergola. She stood trembling as I seized her arms. But the timorous smile remained, and her eyes, upraised to mine, glowed with misty starlight.

"Who are you?"

This time she answered me. "I am called Jetta."

It seemed that from her white forearm within my grasp a magic current swept from her to me and back again. We humans, for all our clamoring, boasting intellectuality, are no more than puppets in Nature's hands.

"Are you Spawn's daughter?"

"Yes."

"I saw you a while ago, when I was having my meal."

"Yes—I was watching you."

"I thought you were a boy."

"Yes. My father told me to keep away. I wanted to meet you, so I came to wake you up."

"He may be watching us now."

"No. He is sleeping. Listen—you can hear him snore."

I could, indeed. The silence of the garden was broken now by a distant, choking snore.

We both laughed. She sat on the little mossy seat in the pergola doorway And on the side away from the snore. (I had the wit to be sure of that.)

"I wanted to meet you," she repeated. "Was it too bold?"

I think that what we said sitting there with the slanting moonlight on us, could not have amounted to much. Yet for us, it was so important! Vital. Building memories which I knew—and I think that she knew, even then—we would never forget.

"I will be here a week, Jetta."

"I want—I want very much to know you. I want you to tell me about the world of the Highlands. I have a few

books. I can't read very well, but I can look at the pictures."

"Oh, I see—"

"A traveler gave them to me. I've got them hidden. But he was an old man: all men seem to be old—except those in the pictures, and you, Philip."

I laughed. "Well, that's too bad. I'm mighty glad I'm young."

Ah, in that moment, with blessed youth surging in my veins, I was glad indeed!

"Young. I don't remember ever seeing anyone like you. The man I am to marry is not like you. He is old, like father—"

I drew back from her, startled.

"Marry?"

"Yes. When I am seventeen. The law of Nareda—your

Highland law, too, father says—will not let a girl be married until she is that age. In a month I am seventeen."

"Oh!" And I stammered, "But why are you going to marry?"

"Because father tells me to. And then I shall have fine clothes: it is promised me. And go to live in the Highlands, perhaps. And see things; and be a woman, not a ragged boy forbidden to show myself; and—"

I was barely touching her. It seemed as though something—some vision of happiness which had been given me—were fading, were being snatched away. I was conscious of my hand moving to touch hers.

"Why do you marry—unless you're in love? Are you?"

Her gaze like a child came up to meet mine. "I never thought much about that. I have tried not to. It frightened me—until to-night."

She pushed me gently away. "Don't. Let's not talk of him. I'd rather not."

"But why are you dressed as a boy?"

I gazed at her slim but rounded figure in tattered boy's garb—but the woman's lines were unmistakable. And her face, with clustering curls. Gentle girlhood. A face of dark, wild beauty.

"My father hates women. He says they are all bad. It is a sin to wear woman's finery; or it breeds sin in women. Let's not talk of that. Philip, tell me—oh, if you could only realize all the things I want to know. In Great New York, there are theatres and music?"

"Yes," I said. And began telling her about them.

The witching of this moonlit garden! But the moon had presently sunk, and to the east the stars were fading.

"Philip! Look! Why, it's dawn already. I've got to leave you."

I held her just a moment by the hand.

"May I meet you here to-morrow night?" I asked.

"Yes," she said simply.

"Good night—Jetta."

"Good night. You—you've made me very happy."

She was gone, into a doorway of the opposite wing. The silent, empty garden sounded with the distant, reassuring snores of the still sleeping Spawn.

I went back to my room and lay on my bed. And drifted off on a sea of magic memories. The world—my world before this night—now seemed to have been so drab. Empty. Lifeless. But now there was pulsing, living magic in it for me.

I drifted into sleep, thinking of it.

Chapter 4: The Mine in the Cauldron Depths

I was awakened by the tinkling, buzzing call of the radio-diaphragm beneath my shirt. I had left the call open.

It was Hanley. I lay down, eyeing my window which now was illumined by the flat light of dawn.

Hanley's microscopic voice:

"Phil? I've just raised President Markes, there in Nareda. I've been a bit worried about you."

"I'm all right, Chief."

"Well, you'd better see President Markes this morning."

"That was my intention."

"Tell him frankly what you're after. This smuggling of quicksilver from Nareda has got to stop. But take it easy, Phil; don't be reckless. Remember: one little

knife thrust and I've lost a good man!"

I laughed at his anxious tone. That was always Hanley's way. A devil himself, when he was on a trail, but always worried for fear one of his men would come to harm.

"Right enough, Chief. I'll be careful."

He cut off presently.

I did not see Jetta that morning. I told Spawn I was hoping to see President Markes on my petroleum proposition. And at the proper hour I took myself to the government house.

This Lowland village by daylight seemed even more fantastic than shrouded in the shadows of night. The morning sun had dissipated the overhead mists. It was hot in the rocky streets under the weird overhanging vegetation. The settlement was quietly busy with its tropical activities. There were a few

local shops; vehicles with the Highland domestic animals—horses and oxen—panting in the heat; an occasional electro-automatic car.

But there were not many evidences of modernity here. The street and house tube-lights. A few radio image-finders on the house-tops. An automatic escalator bringing ore from a nearby mine past the government checkers to an aero stage for northern transportation. Cultivated fields in the village outskirts operated with modern machinery.

But beyond that, it seemed primitive. Two hundred years back. Street vendors. People in primitive, ragged, tropical garb. Half naked children. I was stared at curiously. An augmenting group of children followed me as I went down the street.

The President admitted me at once. In his airy office, with safeguards against eavesdropping, I found him at his desk with a bank of modern instruments before him.

"Sit down, Grant."

He was a heavy-set, flabby man of sixty-odd, this Lowland President. White hair; and an old-fashioned, rolling white mustache of the sort lately come into South American fashion. He sat with a glass of iced drink at his side. His uniform was stiffly white, and ornate with heavy gold braid, but his neckpiece was wilted with perspiration.

"Damnable heat, Grant."

"Yes, Sir President."

"Have a drink." He swung a tinkling glass before me. "Now then, tell me what is your trouble. Smuggling, here in Nareda. I don't believe it." His eyes, incongruously alert with all the rest of him so fat and lazy, twinkled at me. "We of the Nareda Government watch our quicksilver production very closely. The government fee is a third."

I might say that the Nareda government collected a third on all the mineral and agricultural products of

the country, in exchange for the necessary government concessions. Markes exported this share openly to the world markets, paying the duty exactly like a private corporation.

He added, "You think—Hanley thinks—the smuggling is on too large a scale to be any illicit producer?"

I nodded.

"Then," he said, "it must be one of our recognized mines."

"Hanley thinks it is a recognized mine, falsifying its production record," I explained.

"If that is so, I will discover it," he said. He spoke with enthusiasm and vigor. "For you I shall treat as what you are—the representative of our most friendly government. The figures of our quicksilver production I shall lay before you in just a few days. Let me fill up your glass, Grant."

The lazy tropics. I really did not doubt his sincerity. But I did doubt his ability to cope with any clever criminal. His enthusiasm for action would wilt like his neckpiece, in Nareda's heat. Unless, perhaps, the knowledge that the smuggler was cheating him as well as the United States—*that* might spur him.

He added—and now I got a shock wholly unexpected: "If we think that some recognized producer of quicksilver here is cheating us, it should not be difficult to check up on it. Nareda has only one large cinnabar lode being worked. A private individual: that fellow Jacob Spawn—"

"Spawn?" I exclaimed involuntarily.

"Why, yes. Did not he mention it? His mine is no more than ten kilometers from here—back on the southern slope."

"He didn't mention it," I said.

"So? That is strange; but he is a secretive Dutchman by nature. He specializes in prying into the other

fellow's affairs. Hm-m."

He fell into a reverie while I stared at him. Spawn, the big—the only big—quicksilver producer here!

The President interrupted my startled thoughts. "I hope you did not intimate your real purpose?"

"No."

We both turned at the sound of an opening door. Markes called, "Ah, come in Perona! Are you alone? Good! Close that slide. Here is Chief Hanley's representative." He introduced us all in a breath. "This is interesting, Perona. Damnably interesting. We're being cheated, what? It looks that way. Sit down, Perona."

This was Greko Perona. Nareda's Minister of Internal Affairs. Spawn had mentioned him to me. A South American. A man in his fifties. Thin and darkly saturnine, with iron-gray hair, carefully plastered to

cover his half-bald head. He sat listening to the President's harangue, twirling the upturned waxen ends of his artificially black mustache. A wave of perfume enveloped him. A ladies' courtier, this Perona by the look of him. His white uniform was immaculate, carefully tailored and carefully worn to set off at its best his still trim and erect figure.

"Well," he said, when at last the President paused, "of a surety something must be done."

Perona seemed not excited, rather more carefully watchful, of his own words, and of me. His small dark eyes roved me.

"What is it you would plan to do about it, Señorito?"

An irony was in that Latin diminutive! He spread his pale hands. "Your United States officials perhaps exaggerate. I am very doubtful if we have smugglers here in Nareda."

"Unless it is Spawn," the President interjected.

Perona frowned slightly. But his suave manner remained. "Spawn? Why Spawn?"

"You need not take offense, Perona," Markes retorted. "We are discussing this before an envoy of the United States, sent here to consult with us. We have nothing to hide."

Markes turned to me. And his next words were like a bomb exploding at my feet.

"Perona *is* offended, Grant. But I promise you, his natural personal prejudice will not affect my investigation. Of course he is prejudiced, since he is to marry Spawn's daughter, the little Jetta."

I started involuntarily. This pomaded old dotard! This perfumed, ancient dandy!

For all the importance of my mission in Nareda my thoughts had been subconsciously more upon Jetta—far more—than upon smugglers of quicksilver. This

palsied popinjay! This, the reality of the specter which had been between Jetta and me during all that magic time in the moonlit garden!

This suave old rake! Betrothed to that woodland pixie whose hand I had held and to whom I had sung love songs in the magic flower-scented moonlight only a few hours ago! And whom I had promised to meet there again to-night!

This, then, was my rival!

Nothing of importance transpired during the remainder of that interview. Markes reiterated his intention of making a complete governmental investigation at once. To which Perona suavely assented.

"*Por Dios Señorito*," he said to me, "we would not have your great government annoyed at Nareda. If there are smugglers, we will capture them of a certainty."

From the Government House, it now being almost time for the midday meal, I returned to Spawn's.

The rambling mud walls of the Inn stood baking in the noonday heat when I arrived. The outer garden drowsed; there seemed no one about. I went through the main door oval into the front public room, where first I had met Spawn. He was not here now, nor was Jetta.

A sudden furtiveness fell upon me. With noiseless steps I went the length of the dim, padded interior corridor to my own room. My belongings seemed undisturbed; a vague idea that Spawn might have seized this opportunity to ransack them had come to me. But it seemed not; though if he had he would have found nothing.

I stood for a moment listening at my patio window. I could see the kitchen from here; there was no one in it. I started back for the living room. That furtive instinct was still on me. I made no noise. And abruptly I heard Spawn's voice, floating out softly in the hushed silence of the house.

"So, Perona?"

A brief silence, in which it seemed that I could hear a tiny aerial answer. Then Spawn again. A startled oath.

"De duvel! You say—"

I stood frozen, listening.

"She is here.... Yes, I will keep her close. I am no fool, Perona."

Spawn's laugh was like a growl. "Later to-day, yes. Fear not! I am no fool. I will be careful of it."

Spawn, talking by private audiphone, to Perona. The colloquy came to an abrupt end.

"... Might eavesdrop? By hell, you are right!"

I heard the click as Spawn and Perona broke connection. Spawn came from his room. But he was not quick enough. I slipped away before he saw me.

In the living room I had time to be calmly seated with a lighted cigarette. His approaching heavy footsteps sounded. He came in.

"Oh—Grant."

"Good noon, friend Spawn. I'm hungry." I grinned at him. "I understand my bargain with you included a noonday meal. Does it?"

He eyed me suspiciously. "Have you been waiting here long?"

"No. I just came in."

He led me to the kitchen. He apologized for the informality of his hotel service: visitors were so infrequent. But the good quality of his food would make up for it.

"Right," I agreed. "Your food is marvelous, friend Spawn."

There was a difference in Spawn's manner toward me now. He seemed far more wary. Outwardly he was in a high good humor. He asked nothing concerning my morning at the Government House. He puttered over his electron-stove, making me help him; he cursed the heat; he said one could not eat in such heat as this; but the meal he cooked, and the way he sat down opposite me and attacked it, belied him.

He was acting; but so was I. And perhaps I deceived him as little as he deceived me. We avoided the things which were uppermost in the thoughts of us both. But, when we had very nearly finished the meal, I decided to try him out. I said suddenly, out of a silence:

"Spawn, why didn't you tell me you were a producer of quicksilver?" I shot him a sharp glance. "You are, aren't you?"

It took him by surprise, but he recovered himself instantly. "Yes. Are you interested?"

I tried another shot. "What surprised me was that a

wealthy mine owner—you are, aren't you?—should bother to keep an unprofitable hotel. Why bother with it, Spawn?"

I thought I knew the answer: he wanted Nareda's visitors under his eyes.

"That is a pleasure." There was irony in his tone. "I am a lonesome man. I like—interesting companionship, such as yours, young Grant."

It was on my tongue to hint at his daughter. But I thought better of it.

"I am going to the mine now," he said abruptly.

"Would you like to come?"

"Yes," I smiled. "Thanks."

I wanted to see his mine. But that he should be eager to show it, surprised me. I wondered what purpose he could have in that. I had a hint of it later; for when we

took his little autocar and slid up the winding road into the bloated crags towering on the slope behind Nareda, he told me calmly:

"I shall have to put you in charge of my mine commander. I am busy elsewhere this afternoon. You will see the mine just as well without me."

He added. "I must go to the Government House: President Markes wants a report on my recent production."

So that was what Perona had told him over the audiphone just before our noonday meal?

It was an inferno of shadows and glaring lights, this underground cavern. As modern mining activities go, it was small and primitive. No more than a dozen men were here, beside the sweating pudgy mine commander who was my guide. A voluble fellow; of what original nationality I could not determine.

We stood watching the line of carts dumping the ore onto the endless lifting-belt. It went a hundred feet or

so up and out of the cavern's ascending shaft, to fall with a clatter into the bins above the smelter.

"Rich ore," I said. "Isn't it?"

The cinnabar ran like thick blood-red veins in the rock.

"Rich," said the mine commander. "That it is. Rich. But who does it make rich? Only Spawn, not me." He waved his arms, airing his grievance with which for an hour past he had regaled me. "Only Spawn. For me, a dole each week."

The smelter was in a stone building—one of a small group of mine houses which stood in a cauldron depression above excavations. Rounded domes of rock towered above them. The sun, even at this tri-noon hour, was gone behind the heights above us. The murky shadows of night were gathering, the mists of the Lowlands settling. The tube-lights of the mine, strung between small metal poles, winked on like bleary eyes.

"Of a day soon I will fling this job to hell—"

I was paying scant attention to the fellow's tirade. Could there be smuggling going on from this mine? It all seemed to be conducted openly enough. If the production record were being falsified I felt that this dissatisfied mine commander was not aware of it. He showed me the smelter, where the quicksilver condensed in the coils and ran with its small luminous silver streams into the vats.

He was called away momentarily by one of his men, leaving me standing there. I was alone; no one seemed in sight, or within hearing. In the shadow of the condensers I drew out my transmitter and called Hanley.

I got him within a minute.

"Chief!"

"Yes, Phil. I hoped you'd call me. Didn't want to

chance it, raising you when you might not be alone."

I told him swiftly what I had done; where I was now.

And Hanley said, with equal briskness: "I've an important fact. Just had Markes on secret wavelength. He tells me that Spawn has been saving up his quicksilver for six months past. He's got several hundred thousand dollar-standards' worth of it in ingots there right now."

"Here at the mine?"

"Yes. Got them all radiuminized, ready for the highest priced markets. Markes says he is scheduled to turn them over to the government checkers to-morrow. The Nareda government takes its share to-morrow; then Spawn exports the rest."

I heard a footstep. "Off, Chief! I'll call you later!"

I clicked off summarily. The little grid was under my shirt when the mine commander rejoined me.

For another half hour or so I hovered about the smelter house. A treasure of quicksilver ingots here? I mentioned it casually to my companion. He shot me a sharp glance.

"Spawn has told you that?"

"I heard it."

"His business. We do not talk of that. Never can I tell what Spawn will choose to take offense at."

We rambled upon other subjects. Later, he said, "We work not at night. But Spawn, he is here often at night, with his friend, the Señor Perona."

That caught my attention. "I met Perona this morning," I said quickly. "Is he a partner of Spawn's?"

"If he is so, I never was told it. But much he is here—at night."

"Why at night?"

The fellow really knew nothing. Or if he did, he was diplomatic enough not to jeopardize his post by babbling of it to me. He said:

"Perona is Spawn's friend. Why not? His daughter to marry: that will make him a son-in-law." He laughed. "An old fool, but not such a fool either. Spawn is rich."

"His daughter. Has he a daughter?"

"The little Jetta. You haven't seen her? Well, that is not strange. Spawn keeps her very hidden. A mystery about it: all Nareda talks, but no one knows; and Spawn does not like questions."

Spawn abruptly joined us! He came from the black shadows of the lurid smelter room. Had he heard us discussing Jetta? I wondered.

Chapter 5: Mysterious Meeting

"Ah, Grant—have you enjoyed yourself?" He dismissed his subordinate. "I was detained. Sorry."

He was smoothly imperturbable. "Have you seen everything? Quite a little plant I have here? We shut down early to-day. I will make ready to close."

I followed him about while he arranged for the termination of the day's activities. The clatter of the smelter house was presently still; the men departing. Spawn and I were the last to leave, save for the eight men who were the mine's night guards. They were stalwart, silent fellows, armed with electronic needle projectors.

The lights of the mine went low until they were mere pencil points of blue illumination in the gloom. The eery look of the place was intensified by the darkness and silence of the abnormally early nightfall. The fantastic crags stood dark with formless shadow.

Spawn stopped to speak to one of the guards. The

men wore a gold-trimmed, but now dirty, white linen uniform, wilted by the heat—the uniform of Nareda's police. I remarked it to him.

"The government lent me the men," Spawn explained. "Of an ordinary time I have only one guard."

"But this then, is not an ordinary time?" I hinted.

He looked at me sharply. And upon sudden impulse, I added:

"President Markes said something about you having a treasure here. Radiumized quicksilver."

It was evidently Spawn's desire to appear thoroughly frank with me. He laughed. "Well, then, if Markes has told you, then might I not as well admit it? The treasure is here, indeed yes. Will you like to see it?"

He led me into a little strong room adjoining the smelter coil-rectifiers. He flashed his hand

searchlight. On the floor, piled crosswise, were small moulded bars of refined quicksilver—dull, darkened silver ingots of this world's most precious metal.

"Quite a treasure, Grant, here to-night. See, it is radiumized."

He snapped off his torch. In the darkness the little bars glowed irridescent.

"To-morrow I will divide with our Nareda government. One-third for them. And my own share I will export: to Great New York, this shipment. Already I have the order for it."

He added calmly, "The duty is high, Grant. Too bad your big New York market is protected by so large a duty. With my cost of production—these accursed Lowland workmen who demand so much for their labor, and a third of all I produce taken by Nareda—there is not much in it for me."

He had re-lighted the room. I could feel his eyes on me, but I said nothing. It was obvious to me now that

he knew I was a government customs agent.

I said, "This certainly interests me, friend Spawn. I'll tell you why some other time."

We exchanged significant glances, both of us smiling.

"Well can I guess it, young Grant. So here is my treasure. Without the duty I would soon be wealthy. Chut! Why should I roll in a pity for myself? There is a duty and I am an honest man, so I pay it."

I said, "Aren't you afraid to leave this stored here?" I knew that this pile of ingots—the quicksilver in its radiumized form—was worth four or five hundred thousand dollars in American gold-coin at the very least.

Spawn shrugged. "Who would attack it? But of course I will be glad to be rid of it. It is a great responsibility—even though it carries international insurance, to protect my and the Nareda Government share."

He was sealing up the heavy barred portals of the little strong-room. There was an alarm-detector, connected with the office of Nareda's police commander. Spawn set the alarm carefully.

"I have every safeguard, Grant. There is really no danger." He added, as though with sudden thought. "Except possibly one—a depth bandit named De Boer. Ever you have heard of him?"

"Yes. I have."

We climbed into Spawn's small automatic vehicle. The lights of the mine faded behind us as we coasted the winding road down to the village.

"De Boer," said Spawn. "A fellow who lives by his wits in the depths. Near here, perhaps: who knows? They say he has many followers—fifty—a hundred, perhaps—outlaws: a cut-belly band it must be."

"Didn't he once take a hand in Nareda's politics?" I suggested.

Spawn guffawed. "That is so. He was once what they called a patriot here. He thought he might be made President. But Markes ran him out. Now he is a bandit. I have believe that American mail-ship which sank last year in the cauldron north of the Nares Sea—you remember how it was attacked by bandits?—I have always believe that was De Boer's band."

We rolled back to Nareda. Spawn's manner had again changed. He seemed even more friendly than before. More at his ease with me. We had supper, and smoked together in his living room for half an hour afterward. But my thoughts were more on Jetta than on her father. There was still no evidence of her about the premises. Ah, if I only had known what had taken place there at Spawn's that afternoon while I was at the mine!

Soon after supper Spawn yawned. "I think I shall go to bed." His glance was inquiring. "What are you going to do?"

I stood up. "I'll go to bed, too. Markes wants to see me early in the morning. You'll be there, Spawn?"

"Yes. We will go together."

It was still no more than eight o'clock in the evening. Spawn followed me to my bedroom, and left me at its door.

"Sleep well. I will call you in time."

"Thanks, Spawn."

I wondered if there were irony in his voice as he said good night. No one could have told.

I did not go to bed. I sat listening to the silence of my room and the garden, and Spawn's retreating footsteps. He had said he was sleepy, but nevertheless I presently heard him across the patio. He was apparently in the kitchen, cleaning away our meal, to judge by the rattling of his pans. It was as yet not

much after hour eight of the evening. The hours before my tryst with Jetta seemed an interminable time to wait. She might not come, though, I was afraid, until midnight.

At all events I felt that I had some hours yet. And it occurred to me that the evening was not yet too far advanced for me to call upon Perona. He lived not far from here, I had learned. I wanted to see this beribboned old Minister of Nareda's Internal Affairs.

I would use as my excuse a desire to discuss further the possibility of smuggler being here in Nareda.

I put on my hat and a light jacket, verified that my dirk was readily accessible and sealed up my room. Spawn apparently was still in the kitchen. I got out of the house, I felt sure, without him being aware of it.

The Nareda streets were quiet. There was a few pedestrians, and none of them paid much attention to me. It was no more than ten minutes walk to Perona's

home.

His house was set back from the road, surrounded by luxurious vegetation. There was a gate in front of the garden, and another, a hundred feet or so along a small alleyway which bordered the ground to my left. I was about to enter the front gate when sight of a figure passing under the garden foliage checked me. It was a man, evidently coming from the house and headed toward the side gate. He went through a shaft of light that slanted from one of the lower windows of the house.

Perona! I was sure it was he. His slight figure, with a gay, tri-cornered hat. A short tasseled cloak hanging from his shoulders. He was alone; walking fast. He evidently had not seen me. I crouched outside the high front wall, and through its lattice bars I saw him reach the side gate, open it swiftly, pass through, and close it after him. There was something furtive about his manner, for all he was undisguised. I decided to follow him.

The front street fortunately was deserted at the

moment. I waited long enough for him to appear. But he did not; and when I ran to the alley corner—chancing bumping squarely into him—I saw him far down its dim, narrow length where it opened into the back street which bordered his grounds to the rear. He turned to the left and shot a swift glance up the alley, which I anticipated, provided for by drawing back. When I looked again, he was gone.

I have had some experience at playing the shadow. But it was not easy here along the almost deserted and fairly bright Nareda streets. Perona was walking swiftly down the slope toward the outskirts of the village where it bordered upon the Nares Sea. For a time I thought he was headed for the landing field, but at a cross-path he turned sharply to the right, away from the field, whose sheen of lights I could now see down the rocky defile ahead of me. There was nothing but broken, precipitous rocky country ahead of him, into which this path he had taken was winding. What could Perona, a Minister, be engaged in, wandering off alone into this black, deserted region?

It was black indeed, by now. The village was soon far behind us. A storm was in the night air; a wind off the sea; solid black clouds overhead blotted out the moon and stars. The crags and buttes and gullies of this tumbled area loomed barely visible about me. There were times when only my feel of the path under my feet kept me from straying, to fall into a ravine or crevice.

I prowled perhaps two hundred yards behind Perona. He was using a tiny hand-flash now; it bobbed and winked in the darkness ahead, vanishing sometimes when a curve in the path hid him, or when he plunged down into a gully and up again. I had no search-beam. Nor would I have dared use one: Perona could too obviously have seen that someone was following him.

There was half a mile of this, I think, though it seemed interminable. I could hear the sea, rising with the wind, pounding against the rocks to my left. Then, a distance ahead, I saw lights moving. Perona's—and others. Three or four of them. Their combined glow made a radiance which illumined the path and rocks. I could see the figures of several men whom Perona

had joined. They stood a moment and then moved off. To the right a ragged cliff wall towered the path. The spots of light bobbed toward it. I caught the vague outline of a huge broken opening, like a cave mouth in the cliff. The lights were swallowed by it.

I crept cautiously forward.

Chapter 6: Ether-wave Eavesdropping

I had thought it was a cavern mouth into which the men had disappeared, but it was not. I reached it without any encounter. It loomed above me, a great archway in the cliff—an opening fifty feet high and equally as broad. And behind it was a roofless cave—a sort of irregularly circular bowl, five hundred feet across its broken, boulder-strewn, caked-ooze floor.

I crouched in the blackness under the archway. The moon had risen and its light filtered with occasional shafts through the swift-flying black clouds overhead. The scene was brighter. It was dark in the archway, but a glow of moonlight in the bowl beyond showed me its tumbled floor and the precipitous, eroded walls, like a crater-rim, which encircled it.

The men whom Perona had met were across the bowl near its opposite side. I could see the group of them, five hundred feet from me, by a little moonlight that was on them; also by the sheen from the spots of their hand-lights. Four or five men, and Perona. I thought I distinguished the aged Minister sitting on a rock, and

before him a huge giant man's figure striding up and down. Perona seemed talking vehemently: the men were listening; the giant paused occasionally in his pacing to fling a question.

All this I saw with my first swift glance. My attention was drawn from the men to an object near them. The nose of a flyer showed between two upstanding crags on the floor of the valley. Only its forward horizontal propellers and the tip of its cabin and landing gear were visible, but I could guess that it was a fair-sized ship.

The men were too far away for me to hear them. Could I get across the floor of the bowl without discovery? It did not seem so. The accursed moonlight became stronger every moment. Then I saw a guard—a dark figure of a man showing just inside the archway, some seventy feet from me. He was leaning against a rock, facing my way. In his hands was a thick-barreled electronic projector.

I could not advance: that was obvious. The moonlight lay in a clear clean patch beyond the archway. The

guard stood at its edge.

A minute or two had passed. Perona was still talking vehemently. I was losing it: not a word was audible. Yet I felt that if I could hear Perona now, much that Hanley and I wanted to learn would be made clear to us. My little microphone receiver could be adjusted for audible air vibrations. I crouched and held it cautiously above my head with its face, like a listening ear, turned toward the distant men. My single-vacuum amplification brought up the sound until their voices sounded like whispers murmured in my ear-grids.

"De Boer, listen to me—"

Perona's voice. They must have been chance words spoken loudly. It was all I could hear, save tantalizing, unintelligible murmurs.

So this was De Boer, the bandit! The big fellow pacing before Perona. I wanted infinitely more, now, to hear

what was being said.

I thought of Hanley. There might be a way of handling this.

I had to murmur very softly. I was hidden in these shadows from the guard's sight, but he was close enough to hear my normal voice. I chanced it. A wind was sucking through the archway with an audible whine: the guard might not hear me.

"X. 2. AY."

The sorter's desk. He came in. I murmured Hanley's rating. "Rush. Danger. Special."

It went swiftly through. Hanley, thank Heaven, was at his desk.

I plugged in my little image finder; held it over my head; turned it slowly. I whispered:

"Look around, Chief. See where I am? Near Nareda; couple of miles out. Followed Perona; he met these men.

"The big one is De Boer, the depth bandit. I can't hear what they're saying—but I can send you their voice murmurs."

"Amplify them all you can. Relay them up," Hanley ordered.

I caught Perona's murmurs again; I swung them through my tiny transformers and off my transmitter points into the ether.

"Hear them, Chief?"

"Yes. I'll try further amplification."

It was what I had intended. Hanley's greater power might be able to amplify those murmurs into audible strength.

"I'm getting them, Phil."

He swung them back to me. Grotesquely distorted, blurred with tube-hum and interference crackle, they roared in my ear-grids so loudly that I saw the nearby guard turn his head as though startled. Listening....

But evidently he concluded it was nothing.

I cut down the volume. Hanley switched in.

"By God. Phil! This—"

"Off, Chief! Let me hear, too!"

He cut away. Those distorted voices! They came from Perona and the bandits to me across this five hundred foot moonlit bowl; from me, thirteen hundred miles up to Hanley's instruments; and back to me once more. But the words, most of them, now were distinguishable.

Perona's voice: "I tell it to you. De Boer ... and a good chance for you to make the money."

"But will they pay?"

"Of course they will pay. Big. A ransom princely."

"And why, Perona? Why princely? Who is this fellow—so important?"

"He is with rich business men, I tell to you."

"A private citizen?"

"... And a private citizen, of a surety. Fool! Have you come to be a coward, De Boer?"

"Pah!"

"Well then I tell you it is a lifetime chance. All of it I have arranged. If he was a government agent, that would be very different, for they are very keen, this administration of the American government, to protect their agents. But their private citizens—it is a scandal! Do you not ever pick the newscasters' reports, De Boer? Has it not been a scandal that this administration does very little for its citizens abroad?"

"And you want to get rid of this fellow? Why, Perona?"

"That is not your concern. The ransom is to be all yours. Make away with him—in the depths somewhere. Demand your ransom. Fifty thousand gold-standards! Demand it of me. Of Nareda!"

"And you will pay it?"

"I promise it. Nareda will pay it—and Nareda will collect the ransom from the American capitalists. Very easy."

His voice fell lower. "Between us, you will get the ransom money from Nareda—and then kill your prisoner if you like. Call it an accident; what matter? And dead men are silent men, De Boer. I will see that no real pursuit is made after you."

They were talking about me! It was obvious. Questions rushed at me. Perona, planning with this bandit to abduct me. Hold me for ransom. Or kill me!

But Perona knew that I was not a private citizen. He was lying to De Boer, to persuade him.

Why this attack upon me? Was Spawn in on it? Why were they so anxious to get rid of me? Because of Jetta? Or because I was dangerous, prying into their smuggling activities. Or both?

De Boer: "... Get up with my men through the streets to Spawn's house? You have it fixed?"

"Yes. Over the route from here as I told you, there are no police to-night. I have ordered them off. In the garden. *Dios!* You offer so many objections! I tell you all is fixed. In an hour, half an hour; even now, perhaps, the Americano is in the garden. The girl has promised to meet him there. He will be there, fear not. Will you go?"

"Yes."

"Hah! That is the De Boer I have always admired!"

I could see them in the moonlight across the pit.

Perona now standing up, the giant figure of the bandit towering over him.

Hanley's microscopic voice cut in: "Getting it, Phil? To seize you for ransom!"

"Yes. I hear it."

"This girl. Who—?"

"Wait, Chief. Off—"

De Boer: "I will do it! Fifty thousand."

Perona: "An hour now. Spawn will be at his home asleep."

"And you will go to the mine?"

"Yes. Now, from here. You seize this fellow Grant, and then attack the mine. Our regular plan, De Boer. This does not change it."

Attack Spawn's mine! Half a million of treasure was there to-night!

Perona was chuckling: "You give Spawn's guards the signal. They are all my men—in my pay. They will run away when you appear."

Hanley cut in again. "By the gods, they're after that treasure! Phil, listen to me! you must...." His voice faded.

"Chief, I can't hear you!"

Hanley came again: "... And I will notify Porto Rico. The local patrol will be about ready to leave."

"Or notify Nareda headquarters," I suggested. "If you can get President Markes, he can send some police to the mine—"

"And find all Nareda's police bribed by Perona? I'll get Porto Rico. We have an hour or two; the patrol can reach you in an hour."

The bandits were preparing to leave here. Two or three of them had gone to the flyer. Perona and De Boer were parting.

"... Well, that is all, De Boer."

"Right, Señor Perona. I will start shortly."

"On foot, by the street route to Spawn's—"

Hanley's hurried voice came back: "I've sent the call to Porto Rico."

The guard had moved again. He was no more than forty feet away from me now—standing up gazing directly toward where I was crouching over my tiny instruments in the shadows of the rocky arch. A footstep sounded behind me, on the path outside the arch. Someone approaching!

A tiny light bobbing!

Then a voice calling, "Perona! De Boer!"

The guard took a step forward; stopped, with levelled weapon.

Then the voice again: it was so loud it went through my opened relay, flashed up to New York, and blew out half a dozen of Hanley's attuned vacuums.

"Perona!"

Spawn's voice! He was coming toward me! I lay prone, my little grids switched off. I held my breath.

Spawn's figure went past within ten feet of me. But he did not see me.

He met the guard. "Hello, Gutierrez. The damned American—"

Perona and De Boer came hastening. Spawn joined them in the moonlight just beyond the archway, close enough for me to hear them plainly. Spawn was out of breath, panting from his swift walk. He greeted them

with a roar.

"The American—he is gone!"

"*Dios!* Gone where, Spawn?"

"The hell—how do I know, Perona? He is gone from his room—from the house. Maybe he followed you here? Did he?"

Chapter 7: Behind the Sealed Door

There was a moment when I think I might have escaped unseen from that archway. But I was too amazed at Spawn's appearance to think of my own situation. I had believed that Perona was plotting against Spawn, meeting these bandits in this secret place; I had just heard them planning to attack Spawn's mine—to rob it of the treasure doubtless, which I knew was stored there.

But I realized now it was not a plot against Spawn. He had come here swiftly to join Perona and tell him that I, their intended victim, was missing. He had greeted the bandit guard by name. He seemed, indeed, as well known to these bandits as Perona himself.

They stood now in a group some thirty feet away from me. I could hear their excited voices perfectly clearly. My instruments were off; but I recall that as I listened to Spawn I was also aware of the tingle of the electrode-band on my chest—Hanley, vigorously calling me back to find out why I had so summarily disconnected.

"I took him to his room," Spawn was explaining excitedly. "De duvel, why should I have sealed him in? How could I? He is no child!"

De Boer laughed caustically. "And so he has walked away from you? I think I am a fool to mix myself with you two."

Perona retorted, "I have made you rich, De Boer. Think what you like; to-night is the end of our partnership. Only, you do what I have told you to-night."

"Hah! How can I? Your American has flown his trap."

This guard—this Gutierrez, as Spawn had called him—was listening with interest. De Boer's several other men were gathered there. I felt myself safe where I was, for the moment at least.

I cut Hanley in. "Chief, they're closer! Spawn has come! They've missed me! I'll relay what they're

saying, but you step it down; there's too much volume."

"You're all right, Phil? Thank Heaven for that! Something blew my vacuums."

"Chief, listen—here they are—"

Perona: "But he will be back. In the garden now, no doubt, with Jetta."

De Boer: "Ah—the little Jetta! So she is there, Spawn? Not in years have you spoken of your daughter. A young lady now, I suppose. Is it so?"

Spawn cursed. "We leave her out of this. You follow the Señor's plan."

"Come to your house? You think the bird will be there for me to seize?"

"Yes," Perona put in. "You go there; in an hour. Then to the mine."

Spawn undoubtedly was in this plot to attack his mine! He said, "At the mine we have arranged everything. Damn this American! But for Perona I would not bother with him."

"But you will bother," Perona interjected.

De Boer laughed again. "I would be witless could I not figure this! He is a young man, and so handsome he has frightened you with the little Jetta! Is that it, Perona? Jealous, eh?"

I had been holding the image finder so that Hanley might see them. Hanley's voice rattled my ear-grid. "Phil! Get away from there! Look! De Boer is searching!"

De Boer had, a moment before, spoken quietly aside to Gutierrez. And now three or four of the men were spreading out, poking about with small hand-flashes. Searching for me! The possibility that I might be here, eavesdropping!

Hanley repeated vehemently, "Phil, they'll find you! Get out of there: the way is still open!"

Gutierrez was approaching the archway. But I lingered a moment longer.

"Chief, you heard about that girl, Jetta, Spawn's daughter—"

I stopped. Perona was saying, "Spawn, was Jetta still in her room? You did not untie her?"

"No."

"And gagged? Suppose the Americano was back there now? She might call to him, and he would release her —"

De Boer: "How do you know he is not around here? Listening?"

With the assumption that I might be within hearing, De Boer tried to trap me. Gutierrez, at a signal now, suddenly dashed through the archway and planted

himself on the path outside. The other searchers spread their rays; the rocks all about me were lighted. But my niche was still untouched.

De Boer: "If he is around here—"

Perona: "He could not have followed me; I was too careful."

I was murmuring: "Chief, they've got that girl."

"Phil, you get away! Go to Markes. Stay with him."

"But Chief, that Jetta, I—"

"Keep out of this! You're only one; you can't help any! I've sent for the Porto Rican patrol ship to handle this."

"Chief, I'm going back to Spawn's."

"No—"

I cut off abruptly. In another moment I would have been discovered. The searchers were headed directly

for me.

I moved, crouching, back along the inner wall of the archway. The moon was momentarily behind a cloud. It was black under the arch; and out front it was so dim I could only see the faint blob of Gutierrez's standing figure, and the spot of his flashlight.

Perona: "He is not around here, De Boer. That is foolish."

Spawn: "He could have gone anywhere. Maybe a walk around the village."

Perona: "Go back home, Spawn. De Boer will come—"

Their voices faded as I moved away. A searching bandit behind me poked with his light into the crevice where a moment before I had been crouching. I moved faster. Only Gutierrez now was in front of me. He was at the far end of the arch. I could slip past, and still be fifty feet from him—if I could avoid his

swinging little light-beam.

I was running now, chancing that he would hear me. I was on the path; I could see it vaguely.

From behind me came a sizzling flash, and the ting of the flying needle as it missed me by a foot.

"The Americano! He goes there!"

Another shot. The shouts of the bandits in the archway. A turmoil back there.

But it was all behind me. I leaped sidewise off the path as Gutierrez small light-beam swept it. I ran stumbling through a stubble of boulders, around an upstanding rock spire, back to the path again.

There were other shots. Then De Boer's voice, faint by distance: "Stop! Fools! We will alarm the village! The landing field can see our shots from here! Take it easy! You can't get him!"

The turmoil quieted. I went around a bend in the

path, running swiftly.

Pursuit was behind me. I could hear them coming.

It was a run of no more than ten minutes to the junction where, down the slope, I could see the lights of the landing field.

The glow of the village was ahead of me. Then I was in its outskirts. Occasional dark houses. Deserted streets.

I slowed to a fast walk. I was breathless, panting in the heat.

I heard no pursuit now. But Spawn and the rest of them doubtless were after me. Would they head back for Spawn's inn? I thought they would. But I could beat them back there; I was sure there was no shorter route than this I was taking.

Would they use their flyer? That would not gain them

any time, what with launching it and landing, for so short a flight. And a bandit flyer could not very well land unseen or unnoticed, even in somnolent Nareda.

I reached the main section of the village. There were occasional lights and pedestrians. My haste was noticeable, but I was not accosted. There seemed no police about. I recalled Perona's remark that he had attended to that.

My electrode was tingling. I had been running again. I slowed down.

"Chief?"

"Phil." His voice carried relief. "You got away?"

"Yes. I'm in the village."

"Go to President Markes."

"No, I'm headed for Spawn's! They're all behind me; I can get there a few minutes ahead of them."

I panted an exclamation, incoherently, but frankly, about Jetta. "I'm going to get her out of there."

"Phil, what in hell—"

I told him.

"So you've fallen in love with a girl? Entangled—"

"Chief!"

"Go after her, Phil! Got her bound and gagged, have they? Going to marry her to this Perona? Like the Middle Ages?"

I had never seen this side of Hanley.

"Get her if you want her. Get her out of there. Take her to Markes—No, I wouldn't trust anybody in Nareda! Take her into the uplands behind the village. But keep away from that mine! Have you got flash-fuses?"

"Yes."

I was within sight of Spawn's house. The street was dim and deserted. I was running again.

I panted. "I'm—almost at Spawn's!"

"Good! When it's over, whatever happens up there at the mine, then signal the patrol."

"Yes."

I reached Spawn's front gate. The house and front garden were dark.

"Use your fuses, Phil. What colors?"

"I have red and blue."

"I'll talk to the patrol ship again. Tell them to watch for you. Red and blue. Two short red flashes, a long blue."

"Right, Chief. I'm here at Spawn's, cutting off."

"Come back on when you can." His voice went anxious again. "I'll wait here."

"All right."

I cut silent. I ran through the front doorway of Spawn's inn. The living room was dim and empty. Which way was Jetta's room? I could only guess.

I had a few minutes, perhaps, before my pursuers would arrive.

I reached the inner, patio garden. The moon was well out from under the clouds now. The patio shimmered, a silent, deserted fairyland.

"Jetta!" I called it softly. Then louder. "Jetta!"

Spawn's house was fairly large and rambling. There were so many rooms. Jetta was gagged; how could she answer me? But I had no time to search for her.

"Jetta?"

And then came her voice. "Philip?"

"Jetta! Which way? Where are you?"

"Here! This way: in my room."

A window and a door near the pergola. "Jetta!"

"Yes. I am in here. They tied me up. Not so loud, Phil: father will hear you."

"He's gone out."

I reached her garden door. Turned its handle. Rattled the door. Shoved frantically with my shoulder!

The metal door was firmly sealed!

Part 2

WHAT HAS GONE BEFORE

In the year 2020 the oceans have long since drained from the surface of the earth, leaving bared to sun and wind the one-time sea floor. Much of it is flat, caked ooze, cracked and hardened, with, here and there, small scum-covered lakes, bordered by slimy rocks. It is hot, down in the depth of the great Lowland areas, and it is chiefly adventurers and outcasts of human kind who can endure life in what few towns there are.

Into remote Lowlands, in an invisible flyer, go Grant and Jetta—prisoners of a scientific depth bandit.

Into Nareda, the capital village of the tiny Lowland Republic of Nareda, goes Philip Grant, an operative of the United States Customs Department, on a dangerous assignment—to ferret out the men who are smuggling mercury into the United States from that place.

Grant falls in love with Jetta, the daughter of Jacob Spawn, a big mercury mine owner of Nareda, only to learn that Spawn has promised her in marriage to Greko Perona, the country's Minister of Internal Affairs.

Grant follows Perona to a midnight Lowland rendezvous with mysterious strangers and eavesdrops on them, sending their indistinct voice murmurs to his chief, Hanley, in Washington, who relays them back to him, amplified. He learns several important things: that Spawn and Perona and a depth bandit named De Boer are together involved in the smuggling; that they have planned a fake robbery of a fortune in radiumized mercury stored at Spawn's mine, to collect the insurance on it and escape paying the Government export fee: and that they, plan to kidnap Grant for ransom.

The plotters learn of Grant's absence from Nareda, and suspect that he may be nearby. They start to search for him. Grant barely escapes, with the bandits and conspirators in hot pursuit. He flees to Jetta, hoping that they will be able to get away together:

but he finds her tied hand and foot in her room.

The door is tightly sealed.

And close behind him are his pursuers!

Chapter 8: Jetta's Defiance

I must go back now to picture what befell Jetta that afternoon while I was at Spawn's mine. It is not my purpose to becloud this narrative with mystery. There was very little mystery about it to Jetta, and I can reconstruct her viewpoint of the events from what she afterward told me.

Jetta's room was in a wing of the house on the side near the pergola. Her window and door looked out upon the patio. When I had retired—that first night in Nareda—Spawn had gone to his daughter and upbraided her for showing herself while he was giving me that first midnight meal.

"You stay in your room: you have nothing to do with him. Hear me?"

"Yes, Father."

From her infancy he had dominated her; it never occurred to either of them that she could disobey. And yet, this time she did; for no sooner was he asleep

that night than she came to my window as I have told.

This next day Jetta dutifully had kept herself secluded. She cooked her own breakfast while I was at the Government House, and was again out of sight by noon.

Jetta was nearly always alone. I can picture her sitting there within the narrow walls of her little room. Boy's ragged garb. All possible femininity stripped from her. Yet, within her, the woman's instincts were struggling. She sewed a great deal, she since has told me, there in the cloistered dimness. Making little dresses of silk and bits of finery given her surreptitiously by the neighbor women. Gazing at herself in them with the aid of a tiny mirror. Hiding them away, never daring to wear them openly; until at intervals her father would raid the room, find them and burn them in the kitchen incinerator.

"Instincts of Satan! By damn but I will get these woman's instincts out of you, Jetta!"

A

nd there were hours when she would try to read hidden books, and look at pictures of the strange fairy world of the Highlands. She could read and write a little: she had gone for a few years to the small Nareda government school, and then been snatched from it by her father.

When Spawn and I had finished that noonday meal, I recall that he left me for a moment. He had gone to Jetta.

"I am taking that young American to the mine. I will return presently. Stay close, Jetta."

"Yes, Father."

He left with me. Jetta remained in her room, her thoughts upon the coming night. She trembled at them. She would meet me again, this evening in the moonlit garden....

The sound of a man walking the garden path aroused

her from her reverie. Then came a soft ingratiating voice:

"Jetta, *chica Mia!*"

It was Perona, standing by the pergola preening his effeminate mustache.

"Jetta, little love bird, come out and talk to me."

Jetta slammed the window slide and sat quiet.

"Jetta, it is your Greko."

"Well do I know it," she muttered.

"Jetta!" He strode down the path and back. "Jetta."
His voice began rising into a strident, peevish anger.

"Jetta, are you in there? *Chica*, answer me."

No answer.

"Jetta, *por Dios*—" He fumed, then fell to pleading.

"Are you in there? Please, little love bird, answer your

Greko. Are you in there?"

"Yes."

"Come out then. Come to Greko."

S

he said sweetly. "My father does not want me to talk to men. You know that is so, Señor Perona."

It grounded him. "Why—"

"Is it not so?"

"Y-yes, but I am not—"

"A man?" Little imp! She relished impaling him upon the shafts of her ridicule. Her sport was interrupted by the arrival of Spawn. He had left me at the mine and come directly back home. Jetta heard his heavy tread on the garden path, then his voice:

"Ah, Perona."

And Perona: "Jetta will not come out and talk to me." The waxen mustached Minister of Nareda's Internal Affairs was like a sulky child. But Spawn was unimpressed. Spawn said:

"Well, let her alone. We have more important things to engage us. I have the American occupied at the mine. You heard from De Boer?"

"I went last night. All is ready as we planned. But Spawn, this fool of an American, this Grant—"

"Hush! Not so loud, Perona!"

"I am telling you—!" Perona was excited. His voice rose shrilly, but Spawn checked him.

"Shut up: you waste time. Tell me exactly the arrangements with De Boer. *Le grand coup!* now; tonight most important of nights—and you rant of your troubles with a girl!"

T

hey were standing by the pergola, quite near Jetta's shaded window. She crouched there, listening to them. None of this was entirely new to Jetta. She had always been aware more or less of her father's secret business activities. As a child she had not understood them. Nor did she now, with any clarity. Spawn, had always talked freely within her hearing, ignoring her, though occasionally he threatened her to keep her mouth shut.

She heard now fragments of this discussion between her father and Perona. They moved away from the pergola and sat by the fountain, speaking too low for her to hear. And then they paced the path, coming nearer, and she caught their voices again. And occasionally they grew excited, or vehement, and then their raised tones were plainly audible to her.

And this that she heard, with what she knew already, and with what subsequently transpired, enables me

now to piece together the facts into a connected explanation.

In the establishment of his cinnabar mine some years before, Spawn was originally financed by Perona. The South American was then newly made Minister of Nareda's Internal Affairs. He became Spawn's business partner. They kept the connection secret. Spawn falsified his production records; and Perona with his governmental position was enabled to pass these false accounts of the mine's production. Nareda was systematically cheated of a portion of its legal share.

But this, after a time, did not satisfy the ambitious Perona and Spawn. They began to plan how they might engage in smuggling some of their quicksilver into the United States.

Perona, during these years, had had ambitions of his own in other directions. President Markes, of Nareda, was an honest official. He handicapped Perona considerably. There were many ways by which Perona could have grown rich through a dishonest handling

of the government affairs. It was done almost universally in all the small Latin governments. But Markes as President made it dangerous in Nareda. Even the duplicity with the mine was a precarious affair.

T

here was at this time in Nareda a young adventurer named De Boer. A handsome, swaggering fellow in his late twenties. He was a good talker; he spoke many languages; he could orate with fluency and skilful guile. His smile, his colorful personality, and his gift for oratory, made it easy for him to stir up dissatisfaction among the people.

De Boer became known as a patriot. A revolution in Nareda was brewing. Perona, as Nareda's Minister, was De Boer's political enemy. The Nareda Government ran De Boer out, ending the potential revolution. But Perona and Spawn had always secretly been friends with De Boer. It would have been very

handy to have this unscrupulous young scoundrel as President.

When De Boer was banished with some of his most loyal followers, he began a career of petty banditry in the Lowland's depths. Spawn and Perona kept in communication with him, and, by a method which was presently made startlingly clear to Jetta and me, De Boer smuggled the quicksilver for Perona and Spawn. It was this activity which had finally aroused my department and caused Hanley to send me to Nareda.

This however, was a dangerous, precarious occupation. De Boer did not seem to think so, or care. But Perona and Spawn, with their established positions in Nareda, were always fearful of exposure. Even without my coming, they had planned to disconnect from De Boer.

"And for more than that," as Jetta had one day heard Perona remark to her father. "I'll tell to you that this De Boer is not very straight with us, Spawn." De Boer would, upon occasion, fail to make proper return for the smuggled product.

S

o now they had planned a last coup in which De Boer was to help, and then they would be done with him: the two of them, Spawn and Perona, would remain as honest citizens of Nareda, and De Boer had agreed to take himself away and pursue his banditry elsewhere.

It was a simple plan; it promised to yield a high stake quickly. A final fling at illicit activity; then virtuous reformation, with Perona marrying the little Jetta.

B

eneath the strong room at the mine, Perona and Spawn had secretly built a cleverly concealed little vault. De Boer, this night just before the midnight hour, was to attack the mine. Spawn and Perona had bribed the police guards to submit to this attack. The guards did not know the details: they only knew that

De Boer and his men would make a sham attack, careful to harm none of them—and then De Boer would withdraw. The guards would report that they had been driven away by a large force. And when the excitement was over, the ingots of radiumized quicksilver would have vanished!

De Boer, making away into distant Lowland fastnesses, would obviously be supposed to have taken the treasure. But Perona, hidden alone in the strong-room, would merely carry the ingots down into the secret vault, to be disposed of at some future date. The ingots were well insured, by an international company, against theft. The Nareda government would receive one-third of that insurance as recompense for the loss of its share. Perona and Spawn would get two-thirds—and have the treasure as well.

S

uch was the present plan, into which, all unknown to

me, I had been plunged. And my presence complicated things considerably. So much so that Perona grew vehement, this afternoon in the garden, explaining why. His shrill voice carried clearly to Jetta, in spite of Spawn's efforts to shut him up.

"I tell to you that Americano agent will undo us."

"How?" demanded the calmer Spawn.

"Already he has made Markes suspicious."

"Chut! You can befool Markes, Perona. You have for years been doing it."

"This meddling fellow, he has met Jetta!"

"I do not believe it." There was a sudden grimness to Spawn's tone at the thought. "I do not believe it. Jetta would not dare."

"You should have seen him flush when Markes mentioned at the conference this morning that I am to marry Jetta. No one could miss it. He has met her—I

tell it to you—and it must have been last night."

"So, you say?" Jetta could see her father's face, white with suppressed rage. "You think that? And it is that this Grant might be your rival, that worries you? Not our plans for to-night, which have real importance—but worrying over a girl."

"She would not talk to me. She would not come out. He has no doubt put wild ideas into her head. Spawn, you listen to me. I have always been more clever than you at scheming. Is it not so? You have always said it. I have a plan now, it fits our arrangements with De Boer, but it will rid us of this Americano. When all is done and I have married Jetta—"

Spawn interrupted impatiently. "You will marry Jetta, never fear. I have promised her to you."

And because, as Jetta well knew, Perona had made it part of his bargaining in financing Spawn. But this they did not now mention.

"To get rid of this Grant—well, that sounds meritorious. He is dangerous around here. To that I agree."

"And with Jetta—"

"Have done, Perona!" With sudden decision Spawn leaped to his feet. "I do not believe she would have dared talk to Grant. We'll have her out and ask her. If she has, by the gods—"

It fell upon Jetta before she had time to gather her wits. Spawn strode to her door, and found it fastened on the inside.

"Jetta, open at once!"

He thumped with his heavy fists. Confused and trembling she unsealed it, and he dragged her out into the sunlight of the garden.

"Now then, Jetta, you have heard some of what we have been saying, perhaps?"

"Father—"

"About this young American? This Grant?"

She stood cringing in his grasp. Spawn had never used physical violence with Jetta. But he was white with fury now.

"Father, you—you are hurting me."

Perona interposed. "Wait Spawn! Not so rough! Let me talk to her. Jetta, *chica mia*, your Greko is worried —"

"To the hell with that!" Spawn shouted. But he released the girl and she sank trembling to the little seat by the pergola.

Spawn stood over her. "Jetta, look at me! Did you meet—did you talk to Grant last night?"

She wanted to deny it. She clung to his angry gaze. But the habit of all her life of truthfulness with him prevailed.

"Y-yes," she admitted.

Chapter 9: Trapped

"Spawn! Hold!"

There was an instant when it seemed that Spawn would strike the girl. The blood drained from his face, leaving his dark eyes blazing like torches. His hamlike fist went back, but Perona sprang for him and clutched him.

"Hold, Spawn: I will talk to her. Jetta, so you did—"

The torrent of emotion swept Spawn; weakened him so that instead of striking Jetta, he yielded to Perona's clutch and dropped his arm. For a moment he stood gazing at his daughter.

"Is it so? And all my efforts, going for nothing, just like your mother!" He no more than murmured it, and as Perona pushed him, he sank to the bench beside Jetta. But did not touch her, just sat staring. And she stared back, both of them aghast at the enormity of this, her first disobedience.

I never had opportunity to know Spawn, except for the few times which I have mentioned. Perhaps he was at heart a pathetic figure. I think, looking back on it now that Spawn is dead, that there was a pathos to him. Spawn had loved his wife, Jetta's mother. As a young man he had brought her to the Lowlands to seek his fortune. And when Jetta was an infant, his wife had left him. Run away, abandoning him and their child.

Perhaps Spawn was never mentally normal after that. He had reared Jetta with the belief that sin was inherent in all females. It obsessed him. Warped and twisted all his outlook as he brooded on it through the years. Woman's instincts; woman's love of pleasure, pretty clothes—all could lead only to sin.

And so he had kept Jetta secluded. He had fought what he seemed to see in her as she grew and flowered into girlhood, and denied her everything which he thought might make her like her mother.

Spawn met his death within a few hours of this afternoon I am describing. Perhaps he was no more

than a scheming scoundrel. We are instinctively lenient with our appraisal of the dead. I do not know.

"Jetta," Perona said to her accusingly, "that is true, then: you did talk with that miserable Americano last night? You sinful, lying girl."

The contrition within Jetta at disobeying her father faded before this attack.

"I am not sinful." The trembling left her and she sat up and faced the accusing Perona. "I did but talk to him. You speak lies when you say I am sinful."

"You hear, Spawn? Defiant: already changed from the little Jetta I—"

"Yes, I am changed. I do not love you, Señor Perona. I think I hate you." Her tears were very close, but she finished: "I—I won't marry you. I won't!"

It stung Spawn. He leaped to his feet. "So you talk like that! It has gone so far as this, has it? Get to your room! We will see what you will and what you won't!"

Again the crafty Perona was calmest of them all. He thrust himself in front of Spawn.

"Jetta, to-night you plan to see him again, no? To-night?—here?"

"No," she stammered.

"You lie!"

"No."

"You lie! Spawn look at her! Lying! She has planned to meet him to-night! That is all we want to know." He broke into a cackling chuckle. "That fits my new plan, Spawn. A tryst with Jetta, here in the garden."

"Get to your room," Spawn growled. He dragged her back, and Perona followed them.

"You lie there." Spawn flung her to her couch. "After this night's work is done, we'll see whether you will or you won't."

"She may not stay in here." Perona suggested.

"She will stay."

"You seal her in?"

"I will seal her in."

Perona's eyes roved the little bedroom. One window oval and a door, both overlooking the patio.

"But suppose she should get out? There is no way to seal that window properly from outside. A cord!"

A long stout silken tassel-cord had been draped by Jetta at the window curtain. Perona snatched it down.

"If her ankles and wrists were tied with this—"

"No!" burst out Jetta. And then a fear for me rushed over her. A realization, forgotten in the stress of this conflict with her father, now swept over her. They were planning harm to me.

"No, do not bind me."

A sudden caution came to her. She was making it worse for me. Already she had done me immense harm.

She said suddenly, "Do what you like with me. I was wrong. I have no interest in that American. It is you, Greko, I—I love."

Spawn did not heed her. Perona insisted, "I would tie her with care."

He helped Spawn rope her ankles, and then her wrists, crossed behind her.

"A little gag, Spawn? She might cry out: we want no interference to-night." He was ready with a large silken handkerchief. They thrust it into her mouth and tied it behind her neck.

"There," growled Spawn. "You will and you won't: we shall see about that. Lie still, Jetta. If I have need to come again to you—"

They left her. And this time she heard them less

clearly. But there were fragments:

Perona: "I will meet him again. After dark, to-night. Yes, he expects me. For his money, Spawn, his pay in advance. This De Boer works not for nothing."

Spawn: "You will arrange about your police on the streets? He can get here to my house safely?"

"Oh yes, at the tri-evening hour, certainly before midnight, before the attack on the mine. You must stay here, Spawn. Pretend to be asleep: it will lure the fool Americano out in to the moonlight."

Jetta could piece it together fairly well. They would have De Boer come and abduct me. Not tell him I was a government agent, with the micro-safety alarm which they suspected I carried, but just tell De Boer that I was a rich American, who could be abducted and held for a big ransom.

Perona's voice rose with a fragment: "If he springs his alarm, here in the moonlight, you can be here, Spawn, and pretend to try and rescue him. A radio-image of

that flashed to Hanley's office will exonerate us of suspicion."

Perona would promise De Boer that the Nareda government would pay the ransom quickly, collecting it later from the United States.

Spawn said, "You think De Boer will believe that?"

"Why should he not? I am skilful at persuasion, no? Let him find out later that the United States Government trackers are after him!" Perona cackled at the thought of it. "What of that? Let him kill this Grant. All the better."

Spawn said abruptly: "The United States may catch De Boer. Have you thought of that, Perona? The fellow would not shield us, but would tell everything."

"And who will believe him? The wild tale of a trapped bandit! Against your word, Spawn? You, an honest and wealthy mine owner? And I—I, Greko Perona, Minister of Internal Affairs of the Sovereign Power of Nareda! Who will dare to give me the lie because a

bandit tells a wild tale with no real facts to prop it?"

"Those police guards at the mine to-night?"

"Admit that they took your bribes? You are witless, Spawn! Let them but admit it to me and of a surety I will fling them into imprisonment! Now listen with care, for the after noon is going...."

Their voices lowered, then faded, and Jetta was left alone and helpless. Spawn went back to the mine to meet me. We returned and had supper, Jetta could dimly hear us.

There was silence about the house during the mid-evening. I had slipped out and followed Perona to his meeting with De Boer. Then Spawn had discovered my absence and had rushed to join Perona and tell him.

But Jetta knew nothing of this. The hour of her tryst with me was approaching. In the darkness of her room as she lay bound and gagged on her couch, she could see the fitful moonlight rising to illumine the

window oval.

She squirmed at the cords holding her, but could not loosen them. They cut into her flesh; her limbs were numb.

The evening wore on. Would I come to the garden tryst?

Jetta could not break her bonds. But gradually she had mouthed the gag loose. Then she heard my hurried footsteps in the patio; then my tense voice.

And at her answer I was pounding on her door. But it had been stoutly sealed by Spawn. I flung my shoulder against it, raging, thumping. But the heavy metal panels would not yield; the seal held intact.

"Jetta!"

"Philip, run away! They want to catch you! De Boer, the bandit, is coming!"

"I know it!"

Fool that I was, to pause with talk! There was no time: I must get Jetta out of here. Break down this door.

But it would not yield. A gas torch would melt this outer seal. Was there a torch here at Spawn's? But I had no time to search for a torch! Or a bar with which to ram this door—

A panic seized me, with the fresh realization that any instant De Boer and his men would arrive. I beat with futile fists on the door, and Jetta from within, calling to me to get away before I was caught.

This accursed door between us!

And then—after no more than half a minute, doubtless—I thought of the window. My momentary panic left me. I dashed to the window oval. Sealed. But the shutter curtain, and the glassite pane behind it, were fragile.

"Jetta, are you near the window?"

"No. On the bed. They have tied me."

"Look out; I'm breaking through!"

There were loose rocks, as large as my head, set to mark the garden path. I seized one and hurled it. With a crash it went through the window and fell to the floor of the room. A jagged hole showed.

"All right, Jetta?"

"Yes! Yes, Philip."

I squirmed through the oval and dropped to the floor. My arms were cut from the jagged glassite, though I did not know it then. It was dim inside the room, but I could see the outline of the bed with her lying on it.

Her ankles and wrists were tied. I cut the cords with my knife.

She was gasping. "They're planning to capture you. Philip! You should not be here! Get away!"

"Yes. But I'm going to take you with me. Can you stand up?"

I set her on her feet in the center of the room. A shaft of moonlight was coming through the hole in the window.

"Philip! You're bleeding!"

"It is nothing. Cut myself on the glassite. Can you stand alone?"

"Yes."

But her legs, stiffened and numb from having been bound so many hours, bent under her. I caught her as she was falling.

"I'll be—all right in a minute. But Philip, if you stay here—"

"You're going with me!"

"Oh!"

I could carry her, if she could not run. But it would be slow; and it would be difficult to get her through the window. And on the street we would attract too much attention.

"Jetta, try to stand. Stamp your feet. I'll hold you."

I steadied her. Then I bent down, chafing her legs with my hands. Her arms had been limp, but the blood was in them now. She murmured with the tingling pain, and then bent over, frantically helping me rub the circulation back into her legs.

"Better?"

"Yes." She took a weak and trembling step.

"Wait. Let me rub them more, Jetta."

Precious minutes!

"I'll knock out the rest of the window with that rock! We'll run; we'll be out of here in a moment."

"Run where?"

"Away. Into hiding—out of all this. The United States patrol-ship is coming from Porto Rico. It will take us from here."

"Where?"

"Away. To Great New York, maybe. Away from all this; from that old fossil, Perona."

I was stooping beside her.

"I'm all right now, Philip."

I rose up, and suddenly found myself clasping her in my arms; her slight body in the boy's ragged garb pressed against me.

"Jetta, dear, do you trust me? Will you come?"

"Yes. Oh, yes—anywhere, Philip, with you."

For only a breathless instant I lingered, holding her. Then I cast her off and seized the rock from the floor.

The jagged glassite fell away under my blows.

"Now, Jetta. I'll go first—"

But it was too late! I stopped, stricken by the sound of a voice outside!

"He's there! In the girl's room! That's her window!"

Cautious voices in the garden! The thud of approaching footsteps.

I shoved Jetta back and rushed to the broken window oval. The figures of De Boer and his men showed in the moonlight across the patio. They had heard me breaking the glassite. And they saw me, now.

"There he is, De Boer!"

We were trapped!

Chapter 10: The Murder in the Garden

"Hans, keep back! I will go!"

"But Commander—"

"Armed? The hell he is not! Spawn said no. Spawn!
Where is Spawn? He was here."

I had dropped back from the window, and, gripping Jetta, stood in the center of the room.

"Jetta, dear."

"Oh. Philip!"

"There's no other way out of here?"

"No! No!"

Only the heavy sealed door, and this broken window.
The bandits in the garden had paused at sight of me.
Someone had called.

"He may be armed, De Boer."

They had stopped their forward rush and darted into the shelter of the pergola. I might be armed!

We could hear their low voices not ten feet from us. But I was not armed, except for my knife. Futile weapon, indeed.

"Jetta, keep back. If they should fire—"

I got a look through the oval. De Boer was advancing upon it, with his barreled projector half levelled. He saw me again. He called:

"You American, come out!"

I crouched on the floor, pushing Jetta back to where the shadows of the bed hid her.

"You American!"

He was close outside the window. "Come out—or I am coming in!"

I said abruptly, "Come!"

My blade was in my hand. If he showed himself I could slash his throat, doubtless. But what about Jetta? My thoughts flashed upon the heels of my defiant invitation. Suppose, as De Boer climbed in the window, I killed him? I could not escape, and his infuriated fellows would rush us, firing through the oval, sweeping the room, killing us both. But Jetta now was in no danger. Her father was outside, and these bandits were her father's friends. I would have to yield.

I called, louder, "Why don't you come in?"

Could I hold them off? Frighten them off, for a time, and make enough noise so that perhaps someone passing in the nearby street would give the alarm and bring help?

There was a sudden silence in the patio. The bandits had so far made as little commotion as possible. Presently I could hear their low voices.

I heard an oath. De Boer's head and shoulders appeared in the window oval! His levelled projector

came through. Perhaps he would not have fired, but I did not dare take the chance. I was crouching almost under the muzzle, so I straightened, gripped it, and flung it up. I then slashed at his face with my knife, but he gripped my wrist with powerful fingers. My knife fell as he twisted my wrist. His projector had not fired. It was jammed between us. One of his huge arms reached in and encircled me.

"Damn you!"

He muttered it, but I shouted, "Fool! De Boer, the bandit!"

I was aware of a commotion out in the garden.

"... Bring all Nareda on our ears? De Boer, shut him up!"

I was gripping the projector, struggling to keep its muzzle pointed upwards. With a heave of his giant arms De Boer lifted me and jerked me bodily through the window. I fell on my feet, still fighting. But other hands seized me. It was no use. I yielded suddenly. I

panted:

"Enough!"

They held me. One of them growled. "Another shout and we will leave you here dead. Commander, *look!*"

My shirt was torn open. The electrode band about my chest was exposed! De Boer towered head and shoulders over me. I gazed up, passive in the grip of two or three of his men, and saw his face. His heavy jaw dropped as he gazed at my little diaphragms, the electrode.

He knew now for the first time that this was no private citizen he had assaulted. This official apparatus meant that I was a Government agent.

There was an instant of shocked silence. An expression grim and furious crossed the giant bandit's face.

"So this is it? Hans, careful—hold him!"

Jetta was still in her room, silent now. I heard Spawn's voice, close at hand in the patio.

"De Boer! Careful!" It was the most cautious of half-whispers.

Abruptly someone reached for my chest; jerked at the electrode; tore its fragile wires—the tiny grids and thumbnail amplifiers; jerked and ripped and flung the whole little apparatus to the garden path. But it sang its warning note as the wires broke. Up in Great New York Hanley knew then that catastrophe had fallen upon me.

For a brief instant the crestfallen bandit mumbled at what he had done. Then came Spawn's voice:

"Got him, De Boer? Good!"

Triumphant Spawn! He advanced across the garden with his heavy tread. And to me, and I am sure to De Boer as well, there came the swift realization that Spawn had been hiding safely in the background. But my detector was smashed now. It might have imaged

De Boer assailing me: but now that it was smashed, Spawn could act freely.

"Good! So you have him! Make away to the mine!"

I did not see De Boer's face at that instant. But I saw his weapon come up—an act wholly impulsive, no doubt. A flash of fury!

He levelled the projector, not at me, but at the oncoming Spawn.

"You damn liar!"

"De Boer—" It was a scream of terror from Spawn. But it came too late. The projector hissed; spat its tiny blue puff. The needle drilled Spawn through the heart. He toppled, flung up his arms, and went down, silently, to sprawl on his face across the garden path.

De Boer was cursing, startled at his own action. The men holding me tightened their grip. I heard Jetta cry out, but not at what had happened in the garden: she was unaware of that. One of the bandits had left the

group and climbed into her room. Her cry now was suppressed, as though the man's hand went over her mouth. And in the silence came his mumbled voice:

"Shut up, you!"

There was the sound of a scuffle in there. I tore at the men holding me.

"Let me go! Jetta! Come out!"

De Boer dashed for the window. I was still struggling. A hand cuffed me in the face. A projector rammed into my side.

"Stop it, fool American!"

De Boer came back with a chastened bandit ahead of him. The man was muttering and rubbing his shoulder, and De Boer said:

"Try anything like that again, Cartner, and I won't be so easy on you."

De Boer was dragging Jetta, holding her by a wrist. She looked like a terrified, half-grown boy, so small was she beside this giant. But the woman's lines of her, and the long dark hair streaming about her white face and over her shoulders, were unmistakable.

"His daughter." De Boer was chuckling. "The little Jetta."

All this had happened in certainly no more than five minutes. I realized that no alarm had been raised: the bandits had managed it all with reasonable quiet.

There were six of the bandits here, and De Boer, who towered over us all. I saw him now as a swaggering giant of thirty-odd, with a heavy-set smooth-shaved, handsome face.

He held Jetta off. "Damn, how you have grown, Jetta."

Someone said, "She knows too much."

And someone else, "We will take her with us. If you leave her here, De Boer—"

"Why should I leave her? Why? Leave her—for Perona?"

Then I think that for the first time Jetta saw her father's body lying sprawled on the path. She cried, "Philip!" Then she half turned and murmured: "Father!"

She wavered, almost falling. "Father—" She went down, fainting, falling half against me and against De Boer, who caught her slight body in his arms.

"Come, we'll get back. Drag him!"

"But you can't carry that girl out like that, De Boer."

"Into the house: there is an open door. Hans, go out and bring the car around to this side. Give me the cloaks. There is no alarm yet."

De Boer chuckled again. "Perona was nice to keep the police off this street to-night!"

We went into the kitchen. An auto-car, which to the

village people might have been there on Spawn's mining business, slid quietly up to the side entrance. A cloak was thrown over Jetta. She was carried like a sack and put into the car.

I suddenly found an opportunity to break loose. I leaped and struck one of the men. But the others were too quickly on me. The kitchen table went over with a crash.

Then something struck me on the back of the head: I think it was the handle of De Boer's great knife. The kitchen and the men struggling with me faded. I went into a roaring blackness.

Chapter 11: Aboard the Bandit Flyer

I was dimly conscious of being inside the cubby of the car, with bandits sitting over me. The car was rolling through the village streets. Ascending. We must be heading for Spawn's mine. I thought of Jetta. Then I heard her voice and felt her stir beside me.

The roaring in my head made everything dreamlike. I sank half into unconsciousness again. It seemed an endless interval, with only the muttering hiss of the car's mechanism and the confused murmurs of the bandits' voices.

Then my strength came. The cold sweat on me was drying in the night breeze that swept through the car as it climbed the winding ascent. I could see through its side oval a vista of bloated Lowland crags with moonlight on them.

It seemed that we should be nearly to the mine. We stopped. The men in the car began climbing out.

De Boer's voice: "Is he conscious now? I'll take the

girl."

Someone bent over me. "You hear me?"

"Yes," I said.

I found myself outside the car. They held me on my feet. Someone gratuitously cuffed me, but De Boer's voice issued a sharp, low-toned rebuke.

"Stop it! Get him and the girl aboard."

There seemed thirty or forty men gathered here. Silent dark figures in black robes. The moonlight showed them, and occasionally one flashed a hand search-beam. It was De Boer's main party gathered to attack the mine.

I stood wavering on my feet. I was still weak and dizzy, with a lump on the back of my head where I had been struck. The scene about me was at first unfamiliar. We were in a rocky gully. Rounded broken walls. Caves and crevices. Dried ooze piled like a ramp up one side. The moonlight struggled down

through a gathering mist overhead.

I saw, presently, where we were. Above the mine, not below it: and I realized that the car had encircled the mine's cauldron and climbed to a height beyond it. Down the small gully I could see where it opened into the cauldron about a hundred feet below us. The lights of the mine winked in the blurred moonlight shadows.

The bandits led me up the gully. The car was left standing against the gully side where it had halted. De Boer, or one of his men, was carrying Jetta.

The flyer was here. We came upon it suddenly around a bend in the gully. Although I had only seen the nose if it earlier in the evening. I recognized this to be the same. It was in truth a strange looking flyer: I had never seen one quite like it. Barrel-winged, like a Jantzen: multi-propellored: and with folding helicopters for the vertical lifts and descent. And a great spreading fan-tail, in the British fashion. It rested on the rocks like a fat-winged bird with its long cylindrical body puffed out underneath. A seventy-foot

cabin: fifteen feet wide, possibly. A line of small window-ports; a circular glassite front to the forward control-observatory cubby, with the propellers just above it, and the pilot cubby up there behind them. And underneath the whole, a landing gear of the Fraser-Mood springed-cushion type: and an expanding, air-coil pontoon-bladder for landing upon water.

All this was usual enough. Yet, with the brief glimpses I had as my captors hurried me toward the landing incline, I was aware of something very strange about this flyer. It was all dead black, a bloated-bellied black bird. The moonlight struck it, but did not gleam or shimmer on its black metal surface. The cabin window-ports glowed with a dim blue-gray light from inside. But as I chanced to gaze at one a green film seemed to cross it like a shade, so that it winked and its light was gone. Yet a hole was there, like an eye-socket. An empty green hole.

We were close to the plane now, approaching the bottom of the small landing-incline. The wing over my head was like a huge fat barrel cut length-wise in half.

I stared up; and suddenly it seemed that the wing was melting. Fading. Its inner portion, where it joined the body, was clear in the moonlight. But the tips blurred and faded. An aspect curiously leprous. Uncanny. Gruesome.

They took me up the landing-incline. A narrow vaulted corridor ran length-wise of the interior, along one side of the cabin body. To my left as we headed for the bow control room, the corridor window-ports showed the rocks outside. To the right of the corridor, the ship's small rooms lay in a string. A metal interior. I saw almost nothing save metal in various forms. Grid floor and ceiling. Sheet metal walls and partitions. Furnishings and fabrics, all of spun metal. And all dead black.

We entered the control room. The two men holding me flung me in a chair. I had been searched. They had taken from me the tiny, colored magnesium light-flashes. How easy for the plans of men to go astray! Hanley and I had arranged that I was to signal the Porto Rican patrol-ship with those flares.

"Sit quiet!" commanded my guard.

I retorted, "If you hit me again, I won't."

De Boer came in, carrying Jetta. He put her in a chair near me, and she sat huddled tense. In the dim gray light of the control room her white face with its big staring dark eyes was turned toward me. But she did not speak, nor did I.

The bandits ignored us. De Boer moved about the room, examining a bank of instruments. Familiar instruments, most of them. The usual aero-controls and navigational devices. A radio audiphone transmitter and receiver, with its attendant eavesdropping cut-offs. And there was an ether-wave mirror-grid. De Boer bent over it. And then I saw him fastening upon his forehead an image-lens. He said:

"You stay here, Hans. You and Gutierrez. Take care of the girl and this fellow Grant. Don't hurt them."

Gutierrez was a swarthy Latin American. He smiled.

"For why would I hurt him? You say he is worth much

money to us, De Boer. And the girl, ah—"

De Boer towered over him. "Just lay a finger on her and you will regret it, Gutierrez! You stay at your controls. Be ready. This affair it will take no more than half an hour."

A man came to the control room entrance. "You come, Commander?"

"Yes. Right at once."

"The men are ready. From the mine we might almost be seen here. This delay—"

"Coming, Rausch."

But he lingered a moment more. "Hans, my finder will show you what I do. Keep watch. When we come back, have all ready for flight. This Grant had an alarm-detector. Heaven only knows what eavesdropping and relaying he has done. And for sure there is hell now in Spawn's garden. The Nareda police are there, of course. They might track us up

here."

He paused before me. "I think I would not cause trouble, Grant."

"I'm not a fool."

"Perhaps not." He turned to Jetta. "No harm will come to you. Fear nothing."

He wound his dark cloak about his giant figure and left the control room. In a moment, through the rounded observing pane beside me, I saw him outside on the moonlit rocks. His men gathered about him. There were forty of them, possibly, with ten or so left here aboard to guard the flyer.

And in another moment the group of dark-cloaked figures outside crept off in single file like a slithering serpent, moving down the rock defile toward where in the cauldron pit the lights of the mine shone on its dark silent buildings.

Chapter 12: The Attack on the Mine

There was a moment when I had an opportunity to speak with Jetta. Gutierrez sat watchfully by the archway corridor entrance with a needle projector across his knees. The fellow Hans, a big, heavy-set half-breed Dutchman with a wide-collared leather jerkin and wide, knee-length pantaloons, laid his weapon carefully aside and busied himself with his image mirror. There would soon be images upon it, I knew: De Boer had the lens-finder on his forehead, and the scenes at the mine, as De Boer saw them would be flashed back to us here.

This Gutierrez was very watchful. A move on my part and I knew he would fling a needle through me.

My thoughts flew. Hanley had notified Porto Rico. The patrol-ship had almost enough time to get here by now.

I felt Jetta plucking at me. She whispered:

"They have gone to attack the mine."

"Yes."

"I heard it planned. Señor Perona—"

Her hurried whispers told me further details of Perona's scheme. So this was a pseudo attack! Perona would take advantage of it and hide the quicksilver. De Boer would return presently and escape. And hold me for ransom. I chuckled grimly. Not so easy for a bandit, even one as clever as De Boer at hiding in the Lowland depths to arrange a ransom for an agent of the United States. Our entire Lowland patrol would be after him in a day.

Jetta's swift whispers made it all clear to me. It was Perona's scheme.

She ended, "And my father—" Her voice broke; her eyes flooded suddenly with tears "Oh, Philip, he was good to me, my poor father."

I saw that the mirror before Hans was glowing with its coming image. I pressed Jetta's hand.

"Yes, Jetta."

One does not disparage the dead. I could not exactly subscribe to Jetta's appraisal of her parent, but I did not say so.

"Jetta, the mirror is on."

I turned away from her toward the instrument table. Gutierrez at the door raised his weapon. I said hastily, "Nothing. I—we just want to see the mirror."

I stood beside Hans. He glanced at me and I tried to smile ingratiatingly.

"This attack will be successful, eh, Hans?"

"Damn. I hope so."

The mirror was glowing. Hans turned a switch to dim the tube-lights of the room so that we might see the images better. It brought a protest from Gutierrez.

I swung around. "I'm not a fool! You can see me

perfectly well: kill me if I make trouble. I want to see the attack."

"*Por Dios*, if you try anything—"

"I won't!"

"Shut!" growled Hans. "The audiphone is on. The big adventure—and the commander—leaves me here just to watch!"

A slit in the observatory pane was open. The dark figure of one of the bandits on guard outside came and called softly up to us.

"Started. Hans?"

"Starting."

"Should it go wrong, call out."

"Yes. But it will not."

"There was an alarm, relayed probably to Great New York, the commander said, from Spawn's garden.

These cursed prisoners—"

"Shut! You keep watch out there. It is starting."

The guard slunk away. My attention went back to the mirror. An image was formed there now, coming from the eye of the lens upon De Boer's forehead. It swayed with his walking. He was evidently leading his men, for none of them were in the scene. The dark rocks were moving past. The lights of the mine were ahead and below, but coming nearer.

The audiphone hummed and crackled. And through it, De Boer's low-voiced command sounded:

"To the left is the better path. Keep working to the left."

The image of the rocks and the mine swung with a dizzying sweep as De Boer turned about. Then again he was creeping forward.

The mine lights came closer. De Beer's whispered voice said: "There they are!"

I could see the lights of the mine's guards flash on. A group of Spawn's men gathered before the smelter building. The challenge sounded.

"Who are you? Stop!"

And De Boer's murmur: "That is correct, as Perona said. They expect us. Well," he ended with a sardonic laugh, "expect us."

His projector went up. He fired. In the silence of the control room we could hear the audiphoned hiss of it, and see the flash in the mirror-scene. He had fired into the air.

Again his low voice to his men: "Hold steady. They will run."

The group of figures at the smelter separated, waved and scattered back into the deeper shadows. Their hand-lights were extinguished, but the moonlight caught and showed them. They were running away; hiding in the crags. They fired a shot or two, high in the air.

De Boer was advancing swiftly now. The image swayed and shifted, raised and lowered rhythmically as he ran. And the dark shape of the smelter building loomed large as he neared it.

I felt Jetta beside me: heard her whisper: "Why, he should attack and then come back! Greko told my father—"

But De Boer was not coming back! He was dashing for the smelter entrance. Spawn's guards must have known then that there was something wrong. Their shots hissed, still fired high, and our grid sounded their startled shouts. Then as De Boer momentarily turned his head, I saw what was taking place to the side of him. A detachment of the bandits had followed the retreating guards. The bandits' shots were levelled now. Dim stabs of light in the gloom. One of the guards screamed as he was struck.

T

he attack was real! But it was over in a moment. Spawn's men, those who were not struck down, plunged away and vanished. Perona had disconnected the mine's electrical safeguards. The smelter door was sealed, but it gave before the blows of a metal bar two of De Boer's men were carrying.

In the unguarded, open strong-room, Perona, alone, was absorbed in his task of carrying the ingots of quicksilver down into the hidden compartment beneath its metal floor.

Our mirror was vague and dim now with a moving interior of the main smelter room as De Boer plunged through. At the strong-room entrance he paused, with his men crowding behind him. The figure of Perona showed in the vague light: he was stooping under the weight of one of the little ingots. Beside him yawned the small trap-opening leading downward.

He saw De Boer. He straightened, startled, and then shouted with a terrified Spanish oath. De Boer's projector was levelled: the huge, foreshortened muzzle of it blotted out half our image. It hissed its

puff of light—a blinding flash on our mirror—in the midst of which the dark shape of Perona's body showed as it crumpled and fell. Like Spawn, he met instant death.

Jetta was gripping me. "Why—" Gutierrez was with us. Hans was bending forward, watching the mirror. He muttered, "Got him!"

I saw a chance to escape, and pulled at Jetta. But at once Gutierrez stepped backward.

"Like him I will strike you dead!" he said.

No chance of escape. I had thought Gutierrez absorbed by the mirror, but he was not. I protested vehemently:

"I haven't moved, you fool. I have no intention of moving."

And now De Boer and his men were carrying up the ingots. A man for each bar. A confusion of blurred swaying shapes, and low-voiced, triumphant murmurs

from our disc.

Then De Boer was outside the smelter house, and we saw a little queue of the bandits carrying the treasure up the defile. Coming back here to the flyer. There was no pursuit; the mine guards were gone.

The triumphant bandits would be here in a few moments.

"*Ave Maria, que magnifico!*" Gutierrez had retreated to our doorway, more alert than ever upon me and Jetta. Hans called through the window-slit:

"All is well, Franks!"

"Got it?"

"Yes! Make ready."

There was a stir outside as several of the bandits hastened down the defile to meet De Boer. And the tread of others, inside the flyer at their posts, preparing for hasty departure.

Hans snapped off the audiphone and mirror. He bent over his control panel. "All is well, Gutierrez. In a moment we start."

Through the observatory window I saw the line of De Boer's men coming: Abruptly Hans gave a cry. "Look!"

A glow was in the room. A faint aura of light. And our disconnected instruments were crackling, murmuring with interference. Eavesdropping waves were here! Hans realised it: so did I.

But there was no need for theory. From outside came shouts.

"Patrol-ship!"

"Hurry!"

The ship, suddenly exposing its lights, was perfectly visible above us. Five thousand feet up, possibly. A tiny silver bird in the moonlight: but even with the naked eye I could see by its light pattern that it was the official Porto Rican patrol-liner. It saw us down

here: recognized this bandit flyer, no doubt.

And it was coming down!

There was a confusion as the bandits rushed aboard. The patrol was dropping in a swift spiral. I watched tensely, holding Jetta, with the turmoil of the embarking bandits around me. Gutierrez stood with levelled weapon.

"They have not moved, Commander."

De Boer was here. The treasure was aboard.

"Ready, Hans. Lift us."

The landing portes clanged as they closed. Hans shoved at his switches. I heard the helicopter engines thumping. A vertical lift: there was no space in this rocky defile for any horizontal take-away.

He was very calm, this De Boer. He sat in a chair at a control-bank of instruments unfamiliar to me.

"Full power, Hans: I tell you. Lift us!"

The ship was quivering. We lifted. The rocks of the gully dropped away. But the patrol-ship was directly over us. Was De Boer rushing into a collision?

"Now, forward, Hans."

We poised for the level flight. Did De Boer think he could out-distance this patrol-ship, the swiftest type of flyer in the Service? I knew that was impossible.

The silver ship overhead was circling, watchful. And as we levelled for forward flight it shot a warning searchlight beam down across our bow, ordering us to land.

De Boer laughed. "They think they have us!"

I saw his hand go to a switch. A warning siren resounded through our corridor, warning the bandits of De Boer's next move. But I did not know it then: the thing caught me unprepared.

De Boer flung another switch. My senses reeled. I heard Jetta cry out. My arm about her tightened.

A moment of strange whirling unreality. The control room seemed fading about me. The tube-lights dimmed. A green glow took their place—a lurid sheen in which the cubby and the tense faces of De Boer and Hans showed with ghastly pallor. Everything was unreal. The voices of De Boer and Hans sounded with a strange tonelessness. Stripped of the timber that made one differ from the other. Hollow ghosts of human voices. By the sound I could not tell which was De Boer and which was Hans.

The corridor was dark; all the lights on the ship faded into this horrible dead green. The window beside me had a film on it. A dead, dark opening where moonlight had been. Then I realized that I was beginning to see through it once more. Starlight. Then the moonlight.

We had soared almost level with the descending patrol-ship. We went past it, a quarter of a mile away. Went past, and it did not follow. It was still circling.

I knew then what had happened. And why this bandit ship had seemed of so strange an aspect. We were invisible! At four hundred yards, even in the moonlight, the patrol could not distinguish us. Only ten of these X-flyers were in existence: they were the closest secret of the U. S. Anti-War Department. No other government had them except in impractical imitations. I had never even seen one before.

But this bandit ship was one. And I recalled that a year ago, a suppressed dispatch intimated that the Service had lost one—wrecked in the Lowlands and never found.

So this was that lost invisible flyer? De Boer, using it for smuggling, with Perona and Spawn as partners. And now, De Boer making away in it with Spawn's treasure!

The bandit's hollow, toneless, unreal chuckle sounded in the gruesome lurid green of the control room.

"I think that surprised them!"

The tiny silver shape of the baffled local patrol-ship faded behind us as we flew northward over heavy, fantastic crags; far above the tiny twinkling lights of the village of Nareda—out over the sullen dark surface of the Nares Sea.

Chapter 13: The Flight to the Bandit Stronghold

Suring this flight of some six hours—north, and then, I think, northeast—to the remote Lowland fastness where De Boer's base was located, I had no opportunity to learn much of the operation of this invisible flyer. But it was the one which had been lost. Wrecked, no doubt, and the small crew aboard it all killed. The vessel, however, was not greatly damaged: the crew were killed doubtless by escaping poisonous gases when the flyer struck.

How long it lay unfound, I cannot say. Perhaps, for days, it still maintained its invisibility, while the frantic planes of the U. S. Anti-War Department tried in vain to locate it. And then, with its magnetic batteries exhausting themselves, it must have become visible. Perona, making a solo flight upon Nareda business to Great London, came upon it. Perona, Spawn and De Boer were then in the midst of their smuggling activities. They salvaged the vessel secretly. De Boer, with an incongruous flair for mechanical science, was enabled in his bandit camp, to recondition the flyer—building a workshop for the

purpose, with money which Perona freely supplied.

Some of this I learned from De Boer, some is surmise: but I am sure it is close to the facts.

I have since had an opportunity—through my connection with this adventure which I am recording—of going aboard one of the X-flyers of the Anti-War Department, and seeing it in operation with its technical details explained to me. But since it is so important a Government secret, I cannot set it down here. The principles involved are complex: the postulates employed, and the mathematical formulae developing them in theory, are far too intricate for my understanding. Yet the practical workings are simple indeed. Some of them were understood as far back as 1920 and '30, when that pioneer of modern astrophysics, Albert Einstein, first proved that a ray of light is deflected from its normal straight path when passing through a magnetic field.

I am sorry that I cannot give here more than this vague hint of the workings of the fantastic invisible flyers which to-day are so often the subject of

speculation by the general public which never has seen them, and perhaps never will. But I think, too, that a lengthy pedantic discourse here would be out of place. And tiring. After all, I am trying to tell only what happened to me in this adventure. And to little Jetta.

A very strangely capable fellow, this young De Boer. A modern pirate: no other age could have produced him. He did not spare Perona's money, that was obvious. From his hidden camp he must have made frequent visits to the great Highland centers, purchasing scientific equipment: until now, when his path crossed mine. I found him surrounded by most of the every-day devices of our modern world. The village of Nareda was primitive: backward. Save for its modern lights, a few local audiphones and image-finders, and its official etheric connections with other world capitals, it might have been a primitive Latin American village of a hundred years ago.

But not so De Boer's camp, which presently I was to see. Nor this, his flyer, with which his smuggling activities had puzzled Hanley's Office for so many

months. There was nothing primitive here.

De Boer himself was a swaggering villain. I saw him now with his cloak discarded, in the normal tube-lights of the control room when, after a time, the mechanism of invisibility of the flyer was shut off. A fellow of six feet and a half at the very least, this De Boer. Heavy, yet with his great height and strength, lean and graceful. He wore a fabric shirt, with a wide-rolled collar. A wide belt of tanned hide, with lighters, a little electron drink-cooler and other nick-nackeries hanging from tasseled cords—and a naked, ugly-looking knife blade clipped beside a holster which held an old-fashioned exploding projector of leaden steel-tipped bullets.

His trousers were of leather, wide-flaring, ending at his brawny bare knees, with wide-cut, limp leather boots flapping about his calves in ancient piratical fashion. They had flaring soles, these shoes, for walking upon the Lowland caked ooze. The uppers were useless: I rather think he wore them because they were picturesque. He was a handsome fellow, with rough-hewn features. A wide mouth, and very

white, even teeth. A cruel mouth, when it went grim. But the smile was intriguing: I should think particularly so to women.

He had a way with him, this devil-may-care bandit. Strange mixture of a pirate of old and an outlaw of our modern world. With a sash at his waist, a red handkerchief about his forehead, and a bloody knife between his teeth. I could have fancied him a fabled pirate of the Spanish Main. A few hundred years ago when these dry Lowlands held the tossing seas. But I had seen him, so far, largely seated quietly in his chair at his instrument table, a cigarette dangling from his lips, and, instead of a red bandanna about his forehead, merely the elastic band holding the lens of his image-finder. It caught in the locks of his curly black hair. He pushed it askew; and then, since he did not need it now, discarded it altogether.

Where we went I could not surmise, except that we flew low over the sullen black waters of the Nares Sea and then headed northeast. We kept well below the zero-height, with the dark crags of the Lowlands passing under us.

The night grew darker. Storm clouds obscured the moon; and it was then that De Boer shut off the mechanism of invisibility. The control room, with only the watchful Gutierrez now in it—besides De Boer, Jetta and myself—was silent and orderly. But there were sounds of roistering from down the ship's corridor. The bandits, with this treasure of the radiumized quicksilver ingots aboard, were already triumphantly celebrating.

I sat whispering with Jetta. De Boer, busy with charts and navigational instruments, ignored us, and Gutierrez, so long as we did not move, seemed not to object to our whispers.

The night slowly passed. De Boer served us food, calling to one of his men to shove a slide before us. For himself, he merely drank his coffee and an alcoholic drink at his instrument table, while absorbed in his charts.

The roistering of the men grew louder. De Boer leaped to his feet, cursed them roundly, then went back to his calculations. He stood once before Jetta,

regarding her with a strange, slow smile which made my heart pound. But he turned away in a moment.

The bandits, for all De Boer's admonitions, were now ill-conditioned for handling this flyer. But I saw, through the small grid-opening in the control room ceiling, the pilot in his cubby upon the wing-top. He sat alert and efficient, with his lookout beside him.

The night presently turned really tumultuous, with a great wind overhead, and storm clouds of ink, shot through occasionally by lightning flashes. We flew lower, at minus 2,000 feet, on the average. The heavy air was sultry down here, with only a dim blurred vista of the depths beneath us. I fancied that now we were bending eastward, out over the great basin pit of the mid-Atlantic area. No vessels passed us, or, if they did, I did not sight them.

De Boer had a detector on his table. Occasionally it would buzz with calls: liners or patrols in our general neighborhood. He ignored them with a sardonic smile. Once or twice, when our dim lights might have been sighted, he altered our course sharply. And,

when at one period we passed over the lights of some Lowland settlement, he flung us again into invisibility until we were beyond range.

I had, during these hours, ample opportunity to whisper with Jetta. But there was so little for us to say. I knew all of Spawn's and Perona's plot. Both were dead: it was De Boer with whom we were menaced now. And as I saw his huge figure lounging at his table, and his frowning, intent face, the vision of the aged, futile Perona, who had previously been my adversary, seemed inoffensive indeed.

De Boer obviously was pleased with himself. He had stolen half a million dollars of treasure, and was making off with it to his base in the depths. He would smuggle these ingots into the world markets at his convenience; months from now, probably. Meanwhile, what did he intend to do with me? And Jetta? Ransom me? I wondered how he could manage it. And the thought pounded me. What about Jetta? I felt now that she was all the world to me. Her safety, beyond any thought of smugglers or treasure, was all that concerned me. But what was I going to do about it?

I pressed her hand. "Jetta, you're not too frightened, are you?"

"No, Philip."

Her mind, I think, was constantly on her father, lying dead back there on his garden path. I had not spoken of him, save once. She threatened instant tears, and I stopped.

"Do not be too frightened. We'll get out of this."

"Yes."

"He can't escape. Jetta; he can't hide. Why, in a day or so all the patrols of the United States Lowland Service will be after us!"

But if the patrol-ships assailed De Boer, if he found things going badly—he could so easily kill Jetta and me. He might be caught, but we would never come through it alive.

My thoughts drifted along, arriving nowhere, just

circling in the same futile rounds. I was aware of Jetta falling asleep beside me, her face against my shoulder, her fingers clutching mine. She looked like a half grown, slender, ragged boy. But her woman's hair lay thick on my arm, and one of the dark tresses fell to my hand. I turned my fingers in it. This strange little woman. Was my love for her foredoomed to end in tragedy? I swore then that I would not let it be so.

Chapter 14: Jetta Takes a Hand

I came from my reverie to find De Boer before me. He was standing with legs planted wide, arms folded across his deep chest, and on his face an ironic smile.

"So tired! My little captives, *di mi!* You look like babes lost in a wood."

I disengaged myself from Jetta, resting her against a cushion, and she did not awaken. I stood up, fronting De Boer.

"What are you going to do with me?" I demanded.

He held his ironic smile. "Take you to my camp. You'll be well hidden, no one can follow me. My X-flyer's a very handy thing to have, isn't it?"

"So you're the smuggler I was sent after?"

That really amused him. "Er—yes. Those tricksters, Perona and Spawn—we were what you would call partners. He had—the perfumed Perona—what he

thought was a clever scheme for us. I was to take all the risk, and he and Spawn get most of the money. Chah! They thought I was imbecile—pretending to attack a treasure and being such a fool that I would not seize it for myself! Not De Boer!" He chuckled. "Well, so very little did they know me. No treasure yet touched De Boer's fingers without lingering!"

He was in a talkative mood, and drew up his chair and slouched in it. I saw that he had been drinking some alcholite beverage, not enough to befuddle him, but enough to take the keen edge off his wits, and make him want to talk.

"Sit down, Grant."

"I'll stand."

"As you like."

"What are you going to do with me?" I demanded again. "Try to ransom me for a fat price from the United States?"

He smiled sourly. "You need not be sarcastic, young lad. The better for you if I get a ransom."

"Then I hope you get it."

"Perona's idea," he added. "I will admit it looked possible: I did not know then you had Government protection." He went grim. "That was Perona and Spawn's trickery. Well, they paid for it. No one plays De Boer false and lives to tell it. Perona and Spawn wanted to get rid of you—because you annoyed them."

"Did I?"

"With the little Jetta, I fancy." His gaze went to the sleeping Jetta and back to me. "Perona was very sensitive where this little woman was concerned. Why not? An oldish fool like him—"

I could agree with that, but I did not say so.

I said, "You'd better cast me loose, Jetta and me. I suppose you realize, De Boer, that you'll have the

patrols like a pack of hounds after you. Jetta is a Nareda citizen: the United States will take that up. There's the theft of the treasure. And as you say, I'm a Government agent."

He nodded. "Your Government is over-zealous in protecting its agents. That I know, Grant. I might have left you alone, there in the garden, when I realized it. But that, by damn, was too late! Live men talk. Any way, if I cannot ransom you, to kill you is very easy. And dead men are shut-mouthed."

"I'm still alive, De Boer."

He eyed me. "You talk brave."

This condescending, amused giant!

I retorted. "How are you going to ransom me?"

"That," he said. "I have not yet planned it. A delicate business."

I ventured, "And Jetta?" My heart was beating fast.

"Jetta," he said with a sudden snap, "is none of your business."

Again his gaze went toward her. "I might marry her: why not? I am not wholly a villain. I could marry her legally in Cape Town, with all the trappings of clergy—and be immune from capture under the laws there. If she is seventeen. I have forgotten her age, it's been so long since I knew her. Is she seventeen? She does not look it."

I said shortly. "I don't know how old she is."

"But we can ask her when she awakens, can't we?"

He was amusing himself with me. And yet, looking back on it now, I believe he was more than half serious. From his pouch he drew a small cylinder.

"Have a drink, Grant. After all I bear you no ill-will. A man can but follow his trade: you were trying to be a good Government agent."

"Thanks."

"And then you may make it possible for me to pick a nice ransom. Here."

"I hope so." I declined the drink.

"Afraid for your wits?"

I said impulsively, "I want all my wits to make sure you handle this ransom properly, De Boer. I'm as interested as you are: in that at least, we are together."

He grinned, tipped the cylinder at his lips for a long drink.

"Quite so—a mutual interest. Let us be friends over it."

His gaze wandered back to Jetta. He added slowly:

"She is very lovely, Grant. A little woodland flower, just ready for plucking." A sentimental tone, but there was in his expression a ribald flippancy that sent a shudder through me. "She has quite overcome you,

Grant. Well, why not me as well? I am certainly more of a man than you. We must admit that Perona had a good eye."

My thoughts were wandering. Suppose I could not find an opportunity to escape with Jetta? De Boer might successfully ransom me and take her to Cape Town. Or if he feared that to try for the ransom would be too dangerous, doubtless he would kill me out of hand. An ill outcome indeed! Nor could I forget that there was half a million of treasure involved.

It was obvious to me that Hanley would not permit the patrol-ships to attack De Boer with the lives of Jetta and myself at stake. Hanley knew, or suspected, that De Boer was operating an invisible flyer, but I did not see how that could help Hanley much. Markes, acting for Nareda, would doubtless be willing to ransom Jetta: the United States would ransom me. I must urge the ransom plan, because for all the money in the world I would not endanger Jetta, nor let this bandit carry her off.

Or could I escape with her, and still find some means

to save the treasure? It was Jetta's treasure now, two-thirds of it, for it had legally belonged to her father. Could I save it, and her as well?

Not by any move of mine, here now on this flyer. That was impossible. In De Boer's camp, perhaps. But that, too, I doubted. He was too clever a scoundrel to be lax in guarding me.

But in the effecting of a ransom—the exchange of me, and perhaps Jetta, for a sum of money—that would be a delicate transaction, and some little thing could easily go wrong for De Boer. There would be my chance. I would have to make something go wrong! Get in his confidence now so that I would have some say in arranging the details of the ransom. Make him think I was only concerned for my own safety. Appear clever in helping plan the exchange. And then so manipulate the thing that I could escape with Jetta and save the treasure—and the ransom money as well. And capture De Boer, since that was what Hanley had sent me out to accomplish.

Thoughts fly swiftly. All this flashed to me. I had no

details as yet. But that I must get into De Boer's confidence stood but clearly.

I said abruptly, "De Boer, since we are to be friends—"

"So you prefer to sit down now?"

"Yes." I had drawn a small settle to face him. "De Boer, do you intend to ask a ransom for Jetta?"

"You insist with that question?"

"That is my way. Then we can understand each other. Do you?"

"No," he said shortly.

I frowned. "I think I could get you a big price."

"I think I should prefer the little Jetta, Grant."

I held myself outwardly unmoved. "I don't blame you. But you will ransom me? It can be worked out. I have some ideas."

"Yes," he agreed. "It can be worked perhaps. I have not thought of details yet. You are much concerned for your safety, Grant? Fear not."

An amused thought evidently struck him. He added. "It occurs to me how easy, if I am going to ransom you, it will be for me to send you back dead. You might, if I send you back alive, tell them a lot of things about me."

"I will not talk."

"Not," he said, "if I close your mouth for good."

I had no retort. There was no answering such logic; and with his murders of Spawn and Perona, and the deaths of some of the police guards at the mine, the murder of me would not put him in much worse a position.

He was laughing ironically. Suddenly he checked himself.

"Well, Jetta! So you have awakened?"

Jetta was sitting erect. How long she had been awake, what she had heard. I could not say. Her gaze went from De Boer to me, and back again.

"Yes, I am awake."

It seemed that the look she flashed me carried a warning. But whatever it was, I had no chance of pondering it, for it was driven from my mind by surprise at her next words.

"Awake, yes! And interested, hearing this Grant bargain with you for his life."

It surprised De Boer as well. But the alcholite had dulled his wits, and Jetta realized this, and presumed upon it.

"Ho!" exclaimed De Boer. "Our little bird is angry!"

"Not angry. It is contempt."

Her look to me now held contempt. It froze me with startled chagrin; but only for an instant, and then the

truth swept me. Strange Jetta! I had thought of her only as a child; almost, but not quite a woman. A frightened little woodland fawn.

"Contempt, De Boer. Is he not a contemptuous fellow, this American?"

Again I caught her look and understood it. This was a different Jetta. No longer helplessly frightened, but a woman, fighting. She had heard De Boer calmly saying that he might send me back dead—and she was fighting now for me.

De Boer took another drink, and stared at her. "What is this?"

She turned away. "Nothing. But if you are going to ransom me—"

"I am not, little bird."

She showed no aversion for him, and it went to his head, stronger than the drink. "Never would I ransom you!"

He reached for her, but nimbly she avoided him. Acting, but clever enough not to overdo it. I held myself silent: I had caught again the flash of a warning gaze from her. She had fathomed my purpose. Get his confidence. Beguile him. And woman is so much cleverer than the trickiest man at beguiling!

"Do not touch me, De Boer! He tried that. He held my hand in the moonlight—to woo me with his clever words."

"Hah! Grant, you hear her?"

"And I find him now not a man, but a craven—"

"But you will find me a man, Jetta." De Boer was hugely amused. "See Grant, we are rivals! You and Perona, then you and me. It is well for you that I fear you not, or I would run my knife through you now."

I could not mistake Jetta's shudder. But De Boer did not see it, for she covered it by impulsively putting her hand upon his arm.

"Did you—did you kill my father?" She stumbled over the question. But she asked it with a childlike innocence sufficiently real to convince him.

"I? Why—" He recovered from his surprise. "Why no, little bird. Who told you that I did?"

"No one. I—no one has said anything about it." She added slowly, "I hoped that it was not you, De Boer."

"Me? Oh no: it was an accident." He shot me a menacing glance. "I will explain it all. Jetta. Your father and I were friends for years—"

"Yes. I know. Often he spoke to me of you. Many times I asked him to let me meet you."

They were ignoring me. But Gutierrez, lurking in the door oval, was not: I was well aware of that.

"I remember you from years ago, little Jetta."

"And I remember you."

I understand the rationality of her purpose. She could easily get De Beer's confidence. She had known him when a child. Her father had been his business partner, presumably his friend. And I saw her now cleverly altering her status here. She had been a captive, allied with me. She was changing that. She was now Spawn's daughter, here with her dead father's friend.

She turned a gaze of calm aversion upon me. "Unless you want him here, De Boer. I would rather talk to you—without him."

He leaped to his feet. "Hah! that pleases me, little Jetta! Gutierrez, take this fellow away."

The Spanish-American came slouching forward. "The girl's an old friend, Commander? You never told me that."

"Because it is no business of yours. Take him away. Seal him in D-cubby."

I said sullenly. "I misjudged both of you."

Jetta's gaze avoided me. As Gutierrez shoved me roughly down the corridor, De Boer laughed, and his voice came back: "Do not be afraid. We will find some safe way of ransoming you—dead or alive!"

I was flung on a bunk in one of the corridor cubbies, and the door sealed upon me.

Part 3

Chapter 15: In the Bandit Camp

The dark cave, with its small spots of tube-light mounted upon movable tripods, was eerie with grotesque swaying shadows. The bandit camp. Hidden down here in the depths of the Mid-Atlantic Lowlands. An inaccessible retreat, this cave in what once was the ocean floor. Only a few years ago water had been here, water black and cold and soundless. Tremendous pressure, with three thousand or more fathoms of the ocean above it. Fishes had roamed these passages, no doubt. Strange monsters of the deeps: sightless, or with eyes like phosphorescent torches.

Black-garbed figures move in ghastly greenness as the invisible flyer speeds on its business of ransom.

But the water was gone now. Blue ooze was caked upon the cave floor. Eroded walls; niches and tiny gullies; crevices and an arching dome high overhead. A fantastic cave—no one, seeing it as I saw it that morning at dawn, could have believed it was upon this earth. From where De Boer had put me—on the

flat top of a small, butte-like dome near the upper end of the sloping cave floor—all the area of this strange bandit camp was visible to me.

A little tent of parchment was set upon the dome-top.

"Yours," said De Boer, with a grin. "Make yourself comfortable. Gutierrez will be your willing servant, until we see about this ransom. It will have to be one very large, for you are a damn trouble to me, Grant. And a risk. Food will come shortly. Then you can sleep: I think you will want it."

He leaped from the little butte, leaving the taciturn ever-watchful Gutierrez sitting cross-legged on the ledge near me, with his projector across his knees.

The cave was irregularly circular, with perhaps, a hundred-feet diameter and a ceiling fifty feet high. A drift of the fetid, Lowland air went through it—into a rift at this upper end, and out through the lower passage entrance which sloped downward thirty feet and debouched upon a rippled ramp of ooze outside. It was daylight out there now. From my perch I could

see the sullen heavy walls of a ridge. Mist hung against them, but the early morning sunlight came down in shafts penetrating the mist and striking the oily surface of a spread of water left here in the depths of a cauldron.

De Boer's flyer was outside. We had landed by the shore of the sea, and the bandits had pushed the vehicle into an arching recess which seemed as though made to hide it. All this camp was hidden. Arching crags of the ridge-wall jutted out over the cave entrance. From above, any passing flyer—even though well below the zero-height—would see nothing but this black breathing sea, lapping against its eroded, fantastic shore-line.

Within the cave, there was only a vague filtering daylight from the lower entrance, a thin shaft from the rift overhead, and the blue tube-light, throwing great shadows of the tents and the men against the black rock walls.

There seemed perhaps a hundred of the bandits here. A semi-permanent camp, by its aspect. Grey

parchment tents were set up about the floor, some small, others more elaborate. It seemed as though it were a huddled little group of buildings in the open air, instead of in a cave. One tent, just at the foot of my dome, seemed De Boer's personal room. He went into it after leaving me, and came out to join the main group of his fellows near the center of the cave where a large electron stove, and piped water from a nearby subterranean freshet, and a long table set with glassware and silver, stood these men for kitchen and eating place.

The treasure had not yet been brought in from the flyer. But, from what I overheard, it seemed that the radiumized ingots of the ill-fated Spawn and Perona were to be stored for a year at least, here in this cave. I could see the strong-room cubby. It was hewn from the rock of the cave wall, its sealed-grid door-oval set with metal bars.

I saw also what seemed a small but well-equipped machine shop, in a recess room at one side of the cave. Men were working in there under the light of tubes. And there was a niche hollowed out in the wall

to make a room for De Boer's instruments—ether-wave receivers and transmitters, the aerial receiving wires of which stretched in banks along the low ceiling.

There was no activity in there now, except for one man who was operating what I imagined might be an aerial insulator, guarding the place from any prying search-vibrations.

The main cave was a bustle of activity. The arriving bandits were greeting their fellows and exchanging news. The men who had been left here were jubilant at the success of the Chief's latest enterprise. Bottles were unsealed and they began to prepare the morning meal.

My presence caused considerable comment. I was a complication at which most of the men were ill pleased, especially when the arriving bandits told who I was, and that the patrols of the United States were doubtless even now trying to find me.

But De Boer silenced the grumbling with rough

words.

"My business, not yours. But you will take your share of his ransom, won't you? Have done!"

And Jetta, she had caused comment also. But when the bottles were well distributed the grumbling turned to ribald banter which made me shudder that it should fall upon Jetta's ears. De Boer had kept his men away from her, shoving them aside when they crowded to see her. She was in a little tent now, not far from the base of my ledge.

My meal presently was brought from where most of the bandits now were roistering at the long table in the center of the cave.

"Eat," said Gutierrez. "I eat with you, Americano. *Madre Mia*, when you are ransomed away from here it will please me! De Boer is fool, with taking such a chance."

With the meal ended, another guard came to take Gutierrez' place and I was ordered into my tent. The

routine of the camp, it seemed, was to use the daylight hours for the time of sleep. There were lookouts and guards at the entrance, and a little arsenal of ready weapons stocked in the passage. The men at the table were still at their meal. It would end, I did not doubt, by most of them falling into heavy alcoholic slumber.

I was tired, poisoned by the need of sleep. I lay on fabric cushions piled in one corner of my tent. But sleep would not come; my thoughts ran like a tumbling mountain torrent, and as aimlessly. I hoped that Jetta was sleeping. De Boer was now at the center table with his men. Hans was guarding Jetta. He was a phlegmatic, heavy Dutchman, and seemed decent enough.

I wondered what Hanley might be doing to rescue me. But as I thought about it, I could only hope that his patrols would not find us out here. An attack and most certainly De Boer and his men in their anger would kill me out of hand. And possibly Jetta also.

I had not had a word alone with Jetta since that scene

in the control room. When we disembarked, she had stayed close by De Boer. But I knew that Jetta had fathomed my purpose, that she was working to the same end. We must find a way of arranging the ransom which would give us an opportunity to escape.

I pondered it. And at last an idea came to me, vague in all its details, as yet. But it seemed feasible, and I thought it would sound plausible to De Boer. I would watch my chance and explain it to him. Then I realized how much aid Jetta would be. She would agree with my plan, and help me convince him. And when the crucial time came, though I would be a captive, watched by Gutierrez, bound and gagged, perhaps—Jetta would be at liberty. De Boer and Gutierrez would not be on their guard with her.

I drifted off to sleep, working out the details of my plan.

Chapter 16: Planning The Ransom

I was awakened by the sound of low voices outside my tent. Jetta's voice, and De Boer's, and, mingled with them, the babble of the still hilarious bandits in the center of the cave. But there were only a few left now; most of them had fallen into heavy slumber. I had been asleep for several hours, I figured. The daylight shadows outside the cave entrance showed that it was at least noon.

I lay listening to the voices which had awakened me. De Boer was saying:

"But why, Jetta, should I bother with your ideas? I know what is best. This ransom is too dangerous to arrange." His voice sounded calmly good humored; I could hear in it now more than a trace of alcoholic influence. He added, "I think we had better kill him and have done. My men think so, too; already I have caused trouble with them, by bringing him."

It jolted me into full wakefulness.

Jetta's voice: "No! I tell you it can be arranged, Hendrick. I have been thinking of it, planning it—"

"Child! Well what? The least I can do is listen; I am no pig-headed American. Say it out. What would you do to ransom him safely?"

They were just at the foot of my ledge, in front of De Boer's tent. Their voices rose so that I could hear them plainly. For all my start at being awakened to hear my death determined upon, I recall that I was almost equally startled by Jetta's voice. Her tone, her manner with De Boer. Whatever opportunities they had had for talking together, the change in their relationship was remarkable. De Boer was now flushed with drink, but for all that he had obviously still a firm grip upon his wits. And I heard Jetta now urging her ideas upon him with calm confidence. An outward confidence; yet under it there was a vibrant emotion suppressed within her even tone; a hint of tremulous fright; a careful calculation of the effect she might be making upon De Boer. Had he not been intoxicated—with drink and with her—he might have sensed it. But he did not.

"Hendrick, it can be done. A big price. Why not?"

"Because if we are trapped and caught, of what use is the price we might have gotten? Tell me that, wise one?"

"We will not be trapped. And suppose you kill him—won't they track you just the same, Hendrick?"

"No. We would leave his body on some crag where it would be found. The patrols would more quickly tire of chasing a killer when the damage is done. They want Grant alive."

"Then let them have him alive—for a big price. Hendrick, listen—"

"Well, what?" he demanded again. "What is your plan?"

"Why—well, Hendrick, like this—"

She stammered, and I realized that she had no plausible plan. She was fumbling, groping, urging

upon De Boer that I must be ransomed alive. But she had not good reason for it.

"Well?" he prompted impatiently.

"You—can you raise Great New York on the audiphone, Hendrick?"

"Yes," he said.

"Hanley's office?"

"Yes, no doubt. Chah—that would give him a start, wouldn't it? De Boer calmly calling him!"

He was laughing. I heard what sounded as though he were gulping another drink. "By damn, Jetta, you are not the timid bird you look. Call Hanley, eh?"

"Yes. Can it be done and still bar his instruments from locating us?"

"Yes, and bar his television. Believe it, Jetta. I have every device for hiding. But—call Hanley!"

"Why not? ... Hendrick, stop!"

I started. It seemed that he was embracing her; forcing half drunken caresses upon her.

I scrambled through my tent doorway, but Gutierrez, who had come back on guard, at once seized me.

"*Hui*—so haste! Back, you."

The Spaniard spoke softly, and he was grinning. "The chief plays with woman's words, no? Charming señorita, though she dresses like a boy. But that is the more charming, eh? Listen to her, Grant."

He gripped me, and prodded my side with the point of his knife blade. "Lie down Americano: we will listen."

Jetta was insisting. "Hendrick, stop!"

"Why?"

I could see them now. They were seated before the opening of De Boer's tent. A little stove in front of

them. Coffee for Jetta, who was seated cross-legged, pouring it; a bowl of drink for De Boer. And some baked breadstuff dainties on a platter.

"Hendrick—"

She pushed him away as he leaned to embrace her. Although she was laughing with him, I could only guess at the chill of fear that might be in her heart.

"Foolish, Hendrick!"

"Foolish little bird, Jetta mine."

"You—it is you who are foolish, Hendrick." She slid from his embrace and held her brimming coffee cup balanced before her, to ward him off. "You think I am really clever, so trust me, Hendrick. Oh there is a great future for us: you say I inspire you; let me! Hendrick De Boer, Chieftain of the Lowlands! My father would have helped you become that. You can build a little empire. Hendrick—why not? Father wanted to make you President of Nareda. Why not build your own Lowland Empire? We have a hundred

men now? Why not gather a thousand? Ten thousand?
An empire!"

"*Ave Maria*," from Gutierrez. "This *niña* thinks big thoughts!"

De Boer raised his bowl. "An empire—De Boer of the Lowlands! Go on; you amuse me. We have a nice start, with this treasure."

"Yes. And the ransom money. But you will take me first to Cape Town, Hendrick? We can be married there: I am seventeen in a month."

"Of course, Jetta. Haven't I promised?" There was no convincingness to me in the way he said it. "Of course. To Cape Town for our marriage."

"Stop! Hendrick, be serious!" He had reached for her again. "Don't be a fool, Hendrick."

"Very well," he said. "I am all serious. What is your plan?"

She was more resourceful this time. She retorted, "This craven Grant, he fears for his life—but he is very smart, Hendrick. I think he is scheming every moment how he can be safely ransomed."

"Hah! No doubt of that!"

"And he has had experience with Chief Hanley. He knows Hanley's methods, how Hanley will act. Let us see what Grant says of this."

She had no plan of her own, but she hoped that by now I had one! And she was making an opportunity for me to put it before De Boer.

He said, "There is sense to that, Jetta. If there is any way to fool Hanley, that craven American has no doubt thought it out."

She held another drink before him. "Yes. Let us see what he says."

He drank; and again as they were near together he caressed her.

"What a schemer you are, little bird. You and I are well matched, eh?"

"Gutierrez may be watching us!" she warned.

They suddenly looked up and saw Gutierrez and me.

"Hah!" Fortunately it struck De Boer into further good humor. "Hah—we have an audience! Bring down the prisoner, Gutierrez! Let us see if his wits can get him out of this plight. Come down, Grant!"

Gutierrez shoved me down the ladder ahead of him. De Boer stood up and seized me. His great fingers dug into my shoulders.

"Sit down, American! It seems you are not to die. *Perhaps* not."

The strength of his fingers was hurting me: he hoped I would wince. Mine was now an ignominious role, indeed, yet I knew it was best.

I gasped. "Don't do that: you hurt!"

He chuckled and cast me loose. I added, with a show of spirit, "You are a bullying giant. Just because you are bigger than I am—"

"Hear that, Jetta? The American finds courage with his coming ransom!"

He shoved me to the ground. Gutierrez grinned, and withdrew a trifle. Jetta avoided meeting my gaze.

"Have some coffee," De Boer offered. "Alcohol is not good for you. Now say: have you any suggestions on how I can safely ransom you?"

It seemed that Jetta was holding her breath with anxiety. But I answered with an appearance of ready eagerness. "Yes. I have. I can arrange it with complete safety to you, if you give me a chance."

"You've got your chance. Speak out."

"You promise you will return me alive? Not hurt me?"

"De duvel—yes! You have my promise. But your plan

had better be very good."

"It is."

I told it carefully. The details of it grew with my words. Jetta joined in it. But, most of all, it did indeed sound feasible. "But it must be done at once," I urged. "The weather is right; to-night it will be dark; overcast; not much wind. Don't you think so?"

He sent Gutierrez to the cave's instrument room to read the weather forecast instruments. My guess was right.

"To-night then," I said. "If we linger, it only gives Hanley more time to plan trickery."

"Let us try and raise him now," Jetta suggested.

The Dutchman, Hans, had joined us. He too, seemed to think my ideas were good.

Except for the guards at the cave entrance, all the other bandits were far gone in drink. With Hans and

Gutierrez, we went to the instrument room to call Hanley. As we crossed the cave, with Hans and De Boer walking ahead together, De Boer spoke louder than he realized, and the words came back to me.

"Not so bad, Hans? We will use him—but I am not a fool. I'll send him back dead, not alive! A little knife-thrust, just at the end! Safest for us, eh, Hans?"

Chapter 17: Within the Black Sack

We left the bandit stronghold just after nightfall that same day. There were five of us on the X-flyer. Jetta and De Boer, Hans and Gutierrez and myself. The negotiations with Hanley had come through satisfactorily; to De Boer, certainly, for he was in a triumphant mood as they cast off the aero and we rose over the mist-hung depths.

It was part of my plan, this meager manning of the bandit ship. But it was mechanically practical: there was only Hans needed at the controls for this short-time flight: with De Boer plotting his course, working out his last details—and with Gutierrez to guard me.

De Boer had been quite willing to take no other men—and most of them were too far gone in their cups to be of much use. I never have fathomed De Boer's final purpose. He promised Jetta now that when I was successfully ransomed he would proceed to Cape Town by comfortable night flights and marry her. It pleased Gutierrez and Hans, for they wanted none of their comrades. The treasure was still on the flyer.

The ransom gold would be added to it. I think that De Boer, Gutierrez and Hans planned never to return to their band. Why, when the treasure divided so nicely among three, break it up to enrich a hundred?

I shall never forget Hanley's grim face as we saw it that afternoon on De Boer's image-grid. My chief sat at his desk with all his location detectors impotent, listening to my disembodied voice explaining what I wanted him to do. My humble, earnest, frightened desire to be ransomed safely at all costs! My plea that he do nothing to try and trap De Boer!

It hurt me to appear so craven. But with it all, I knew that Hanley understood. He could imagine my leering captor standing at my elbow, prompting my words, dictating my very tone—prodding me with a knife in the ribs. I tried, by every shade of meaning, to convey to Hanley that I hoped to escape and save the ransom money. And I think that he guessed it, though he was wary in the tone he used for De Boer to hear. He accepted, unhesitatingly, De Boer's proposition: assured us he would do nothing to assail De Boer; and never once did his grim face convey a hint of anything

but complete acquiescence.

We had President Markes on the circuit. De Boer, with nothing to lose, promised to return Jetta with me. In gold coin, sixty thousand U. S. dollar-standards for me; a third as much from Nareda, for Jetta.

The details were swiftly arranged. We cut the circuit. I had a last look at Hanley's face as the image of it faded. He seemed trying to tell me to do the best I could; that he was powerless, and would do nothing to jeopardize my life and Jetta's. Everything was ready for the affair to be consummated at once. The weather was right; there was time for Hanley and De Boer each comfortably to reach the assigned meeting place.

We flew, for the first hour, nearly due west. The meeting place was at 35 deg. N. by 59 deg. W., a few hundred miles east by north of the fairy-like mountaintop of the Bermudas. Our charts showed the Lowlands there to run down to what once was measured as nearly three thousand fathoms—called now eighteen thousand feet below the zero-height. A

broken region, a depth-ridge fairly level, and no Lowland sea, nor any settlements in the neighborhood.

The time was set at an hour before midnight. No mail, passenger or freight flyers were scheduled to pass near there at that hour, and, save for some chance private craft, we would be undisturbed. The ransom gold was available to Hanley. He had said he would bring it in his personal Wasp.

The details of the exchange were simple. Hanley, with only one mechanic, would hover at the zero-height, his Wasp lighted so that we could see it plainly. The wind drift, according to forecast, would be southerly. At 11 P.M. Hanley would release from his Wasp a small helium-gas balloon-car—a ten-foot basket with the supporting gas bag above it, weighted so that it would slowly descend into the depths, with a southern drift.

Our flyer, invisible and soundless, would pick up the balloon-car at some point in its descent. The gold would be there, in a black casket. De Boer would take

the gold, deposit Jetta and me in the car, and release it again. And when the balloon finally settled to the rocks beneath, Hanley could pick it up. No men would be hidden by Hanley in that basket. De Boer had stipulated that when casting loose the balloon, its car must be swept by Hanley with a visible electronic ray. No hidden men could withstand that blast!

Such was the arrangement with Hanley. I was convinced that he intended to carry it out to the letter. He would have his own invisible X-flyer in the neighborhood, no doubt. But it would not interfere with the safe transfer of Jetta and me.

That De Boer would carry out his part, Hanley could only trust. He had said so this afternoon bluntly. And De Boer had laughed and interposed his voice in our circuit.

"Government money against these two lives, Hanley! Of course you have to trust me!"

It was a flight, for us, of something less than four hours to the meeting place. Hans was piloting, seated

alone in the little cubby upon the forward wing-base, directly over the control room. De Boer, with Jetta at his side, worked over his course and watched his instrument banks. I was, at the start of the flight, lashed in a chair of the control room, my ankles and wrists tied and Gutierrez guarding me.

Jetta did not seem to notice me. She did not look at me, nor I at her. She pretended interest only in the success of the transfer; in her father's treasure on board, the coming ransom money, and then a flight to Cape Town, dividing the treasure only with Hans and Gutierrez; and in her marriage with De Boer. She said she wanted me returned to Hanley alive; craven coward that I was, still I did not deserve death. De Boer had agreed. But I knew that at last, as they tumbled me into the basket, someone would slip a knife into me!

I had, as we came on board, just the chance for a few whispered sentences with Jetta. But they were enough! We both knew what we had to do. Desperate expedient, indeed! It seemed more desperate now as the time approached than it had when I planned it.

The weather at 7 P.M. was heavily overcast. Sultry, breathless, with solid, wide-flung cloud areas spread low over the zero-height. Night settled black in the Lowlands. The mists gathered.

We flew well down—under the minus two thousand-foot level—so that out of the mists the highest dome peaks often passed close beneath us.

At 8 P.M. De Boer flung on the mechanism of invisibility. The interior of the ship faded to its gruesome green darkness. My senses reeled as the current surged through me. Lashed in my chair, I sat straining my adjusting eyes, straining my hearing to cope with this gruesome unreality. And my heart was pounding. Would Jetta and I succeed? Or was our love—unspoken love, born of a glance and the pressure of our hands in that moonlit Nareda garden—was our love star-crossed, foredoomed to tragedy? A few hours, now, would tell us.

De Boer was taking no chances. He was using his greatest intensity of power, with every safeguard for complete invisibility and silence. From where I sat I

could make out the black form of Hans through the ceiling grid, at his pilot controls in the overhead cubby. A queer glow like an aura was around him. The same green radiance suffused the control room. It could not penetrate the opened windows of the ship; could not pass beyond the electro-magnetic field enveloping us. Nor could the curious hum which permeated the ship's interior get past the barrage barrier. From outside, I knew, we were invisible and inaudible.

Strange unreality, here in the control room! The black-garbed figures of De Boer and Jetta at their table were unreal, spectral. At the door oval, which I could barely see, Gutierrez lurked like a shadow. All of them, and Hans in the cubby above, were garbed in tight-fitting dead-black suits of silklene fabric. Thin, elastic as sheer silk web, opaque, lustreless. It covered their feet, legs and bodies; and their arms and hands like black, silk gloves. Their heads were helmeted with it. And they had black masks which as yet were flapped up and fastened to the helmet above their foreheads. Their faces only were exposed, tinted

a ghastly, lurid green by this strange light. It glowed and glistened like phosphorescence on their eyeballs, making them the eyes of animals in a hunter's torchlight, at night.

De Boer moved upon an errand across the control room. He was a burly black spectre in the skin-tight suit. His footfalls faintly sounded on the metal floor. They were toneless footfalls. Unreal. They might have been bells, or jangling thuds; they had lost their identity in this soundless, vibrating hum.

And he spoke, "We are making good progress, Jetta. We will be on time."

Ghastly voice! So devoid of every human timbre, every overtone shade to give it meaning, that it might have been a man's voice, or a woman's, the voice of something living, or something dead. Sepulchral. A stripped shell of voice. Yet to me, inside here with it, it was perfectly audible.

And Jetta said, "Yes, Hendrick, that is good."

A voice like his: no different.

Gruesome. Weird.

I try now to picture the scene in detail, for out of these strange conditions Jetta and I were to make our opportunity.

9 P.M. De Boer was a methodical fellow. He checked his position on the chart. He signalled the routine orders to Hans. And he gestured to Gutierrez. The movements and acts of everyone had been definitely planned. And this, too, Jetta and I had anticipated.

"Time to make him ready, Gutierrez. Bring the sack in here. I'll fasten him away."

I was not garbed like the others. They could move out on the wing runway under Hanley's eyes at short range, or climb in and out of the balloon car, and not be visible.

Gutierrez brought the sack. A dead-black fabric.

"Shall I cut him loose now from his chair,
Commander?"

"I'll do it."

De Boer drew a long knife blade, coated black, and thin and sharp as a half-length rapier. Gutierrez had one of similar fashion. No electronic weapons were in evidence, probably because the hiss of one fired would have been too loud for our barrage, and its flash too bright. But a knife thrust is dark and silent!

The Spaniard's eyes were gleaming as he approached me with the bag, as though he were thinking of that silent knife thrust he would give me at the last.

Dr. Boer said, "Stand up, Grant." He cut the fastenings that held me in my chair. But my ankles and wrists remained tied.

"Stand up, can't you?"

"Yes."

I got unsteadily to my feet. In the blurred green darkness I could see that Jetta was not looking at me. Gutierrez held the mouth of the sack open. As though I were an upright log of wood, De Boer lifted me.

"Pull it up over his feet, Gutierrez."

The oblong sack was longer than my body. They drew it over me, and bunched its top over my head. And De Boer laid me none too gently on the floor.

"Lie still. Do you get enough air?"

"Yes."

The black fabric was sufficiently porous for me to breathe comfortably inside the sack.

"All right, Gutierrez, I have the gag."

I felt them carrying me from the control room, twenty feet or so along the corridor, where a door-porte opened to a small balcony runway hung beneath the forward wing. Jutting from it was a little take-off

platform some six feet by twelve in size. It was here that the balloon-basket was to be boarded. The casket containing the ransom gold would be landed here, and the sack containing me placed in the car and cast loose. It was all within the area of invisibility of our flyer.

De Boer knelt over me, and drew back the top of the sack to expose my face.

"A little gag for you, Grant, so you will not be tempted to call out."

"I won't do that."

"You might. Well, good-by, American."

"Good-by." And I breathed, "Good-by Jetta." Would I ever see her again? Was this the end of everything for us?

He forced the gag into my mouth, tied it, and verified that my ankles and wrists were securely lashed. In the green radiance he and Gutierrez were like ghouls

prowling over me, and their muffled toneless voices, tomblike.

The sack came up over my head.

"Good-by, Grant." I could not tell which one said it. And the other chuckled.

I could feel them tying the mouth of the sack above my head. I lay stiff. Then I heard their steps. Then silence.

I moved. I might have rolled, but I did not try it. I could raise my knees within the sack—double up like a folded pocket knife—but that was all.

A long, dark silence. It seemed interminable. Was Gutierrez guarding me here in the corridor? I could not tell; I heard nothing save the vague hum of the electronite current.

It had been 9 o'clock. Then I fancied that it must be 10. And then, perhaps, almost 11. I wondered what the weather outside was like. Soon we would be

nearing the meeting place. Would Hanley be there? Would Jetta soon, very soon now, be able to do her part? I listened, horribly tense, with every interval between the thumps of my heart seeming so long a gap of waiting.

I heard a sound! A toneless, unidentifiable sound. Another like it; a little sequence of faint sounds. Growing louder. Approaching footsteps? Jetta's? I prayed so.

Then a low voice. Two voices. Both the same in quality. But from the words I could identify them.

"Hello, Gutierrez."

"*Niña*, hello."

Jetta! She had come!

"The captive is safe? No trouble?"

"No. He has not moved."

"Careful of him, Gutierrez. He is worth a lot of money to us."

"Well you say it. Señorita. In half an hour now, we will be away. Santa Maria, when this is over I shall breathe with more comfort!"

"We'll have no trouble, Gutierrez. We're almost there. In ten minutes now, or a little more."

"So soon? What time is it?"

"Well, after half-past ten. When it's over, Gutierrez, we head for Cape Town. Clever of me, don't you think, to persuade Hendrick to take us to Cape Town? Just you three men to divide all this treasure. It would be foolish to let a hundred others have it."

"True, *Niña*; true enough."

"I insisted upon you and Hans—Gutierrez, what is that?"

A silence.

"I heard nothing."

"A voice, was it?"

"The Americano?"

"No! No—the commander calling? Was it? Calling you, Gutierrez? Perhaps we have sighted Hanley's Wasp. Go! I'll stand here, and come quickly back."

Footsteps. Now! Our chance, come at last! I twisted over on my side, and lay motionless. Ah, if only those were Gutierrez' fading footfalls! And Jetta, here alone with me in the green darkness! Just for this one vital moment.

Fingers were fumbling at the top of my sack, unfastening the cord. Hands and arms came swiftly in. Fingers ran down my back as I lay on my side to admit them quickly. Fingers went fumbling at the cords that lashed my crossed wrists behind me. A knee pressed against me. A hurried, panting, half sobbing breath close over me—

Just a hurried moment. The hands withdrew. The sack went back over my head. The knees, the slight weight against me, was gone. A few seconds only.

Footsteps. The voices again.

"Was it the commander, Gutierrez?"

"No. I do not know what it was. Nothing, probably."

"The Wasp in sight?"

"Not yet, *Niña*. You had best go back: De Boer, he might be jealous of us, no? He is busy with his instruments, but should he realize you are here, talking with me—"

"Senseless, Gutierrez!"

"Is it so, *Niña*? I have no attraction? Go back to him. Gold I want, not trouble over you!"

Faint laughter.

"When we sight the Wasp, I'll call and tell you,

Gutierrez. Too bad you won't let me stay with you. I like you."

"Yes. But go now!"

Faint laughter. Footsteps. Then silence.

Our vital moment had come and passed. And Jetta had done her part; the role of action upon this dim lurid stage was now mine to play.

My hands were free.

Chapter 18: The Combat in the Green Darkness

Another interval. A dead, dark silence. I did not dare move. Gutierrez was here, within a few feet of me, probably. I wondered if he could see the outlines of the black sack. Doubtless they were very vague. But if I exposed my flesh, my face, my hands, that would at once attract his attention.

I worked the loosened cords from my wrists; moved my stiffened hands until, with returning blood, the strength came to them. I could not reach my bound ankles without doubling up my knees. I did not dare chance such a movement of the sack. But, after a moment, I got my hands in front of me.

Then I took the gag from my mouth and, with a cautious hand, pried at the top of the sack where it was bunched over my head. Its fastening was loose.

Another interval. A dim muffled voice; "The Wasp is in sight, Gutierrez!"

A movement—a sound like footsteps. Probably

Gutierrez moving to the corridor window to glance at Hanley's distant hovering flyer. I hoped it might be that: I had to take the chance.

I slid the bag from my face. I feared an abrupt alarm, or Gutierrez leaping upon me. But there was silence, and I saw his vague dark outlines at the window oval, five feet from me.

I got my ankles loose and slid the bag off. I was unsteady on my feet, but desperation aided me.

Gutierrez half turned as I gripped him from behind. My hand on his mouth stifled his outcry. His black knife blade waved blindly. Then my clenched knuckle caught his temple, and dug with the twisting Santus blow. I was expert at it, and I found the vulnerable spot.

He crumpled in my grasp, and I slid his falling body across the narrow corridor into the nearest cubby oval.

Almost soundless; and in the control room Jetta and

De Boer were murmuring and gazing at Hanley's ship, which hung ahead and above us at the zero-height.

I had planned all my movements. No motion was lost. Gutierrez was about my height and build. I stripped his black suit from him, donned it, then tied his ankles and wrists, and gagged him against the time when he would recover consciousness. Then I stuffed his body in the sack and tied its top.

This black suit had a mask, rolled up and fastened to the helmet. I loosed it, dropping it over my face. Knife in hand, I stood at the corridor window.

It was all black outside. The clouds were black overhead; the highest Lowland crags, several thousand feet beneath us, were all but blotted out in the murky darkness. Only one thing was to be seen: a quarter of a mile ahead, now, and a thousand feet higher than our level, the shining, bird-like outlines of Hanley's hovering little Wasp. It stood like a painted image of an aero, alone on a dead-black background. Red and green signal-lights dotted it, and on its stern tip a small, spreading searchlight bathed the wings

and the body with a revealing silver radiance.

Our forward flight had been checked, and we, too, were hovering. Hans doubtless would remain for a time in the pilot cubby; De Boer and Jetta were in the control room. It was only twenty feet away, but I could barely see its oval entrance.

"Gutierrez!"

One of them was calling. My hollow empty voice echoed back as I softly responded:

"Yes?"

"Be ready. We are arrived."

"Yes, Commander. All is well."

I continued to stand at the window. Hanley's little balloon-car was visible now. Then he cut it away. We had moved forward in the interval. The tiny car floated out almost above us.

My gaze searched the void of darkness outside. Did Hanley have an invisible flyer out there? Perhaps so. But it could accomplish nothing as yet. It would not even dare approach, for fear of collision with us.

The tiny car, with a white pilot light in it, swayed with a slow descent. The basket beneath the supporting balloon oscillated in a wide swing, then steadied. A sudden flash showed up there—a flashing electronic stream, from Hanley's Wasp to the basket. The shot swept the basket interior. No one could be hidden there and survive.

It was Hanley's proof to us that he was following instructions.

"Hah! He obeys properly, Jetta!"

The voice floated back to me from the control room. Could I creep in there, surprise De Boer now, and kill him? Doubtless. But it would alarm Hans. I must await my chance to get them together.

"Gutierrez! Hans, get us under it! Gutierrez!"

The vague outline of De Boer came toward me in the corridor, burly dark blob. His mask was down now. There were points of light, glowing like faint distant stars, to mark his eyes.

"Gutierrez."

"Yes."

A small black figure followed after him. Jetta.

"Yes, De Boer." I stood over the sack. "I am ready."

De Boer's giant shape towered beside me. Now! My knife thrust now! But Hans was coming toward us. He would take alarm before I could reach him.

"Open the side porte, Gutierrez. Hurry, the car is here. Hans, you should have stayed up there!"

"The drift is calculated; the car is just here."

We were all swift-moving shadows; disembodied voices.

"Get that porte open."

"Yes." I opened it.

We went outside on the runway. I passed close to Jetta, and just for an instant pressed my gloved fingers on the black fabric of her arm—and she knew.

"Now, seize it."

"Here, Hans, climb up."

"I have it. Pull it, Gutierrez!"

The car drifted at us from the black void. We caught it.

"Hold it, Gutierrez."

"Hans, clip the balloon. Up with you."

In the blurred haste, I could not get them together. I did not want to kill one and have the other leap upon me.

We fastened the little balloon and dragged the car onto the take-off platform. The shape of Hans leaped into the car.

"It is here! The ransom money!"

"Lift it to me. Heavy?"

"Yes."

"Gutierrez, help me. Hurry! If Hanley tries any trickery—"

Our aero was drifting downward and southward in the slight wind. Hanley's Wasp still hovered at the zero-height.

"In, Gutierrez."

Hans and I hauled out the heavy casket and placed it on the wing runway. De Boer pried up its lid. The gold was there. I could not tell where Jetta was; I prayed she would keep away from this.

Then the shape of De Boer was missing! But in a moment he appeared, dragging the sack.

"Lift him, Gutierrez. Hans, unclip the balloon and shove off the car!"

We were all standing at the two-foot rail of the runway. The car-basket, floating now, was off side and level with us. My chance!

"In with him, Gutierrez."

I shoved the body, encased in its black sack, with Hans helping me. And suddenly De Boer's knife came down at the sack! A stab. But an instinct to save the poor wretch within swept me. I struck at De Boer's arm and deflected the blow. The sack tumbled into the car.

I had neglected whatever chance had existed. Too late now!

"What in the hell!"

De Boer's shape seized me.

"What—"

It sent me into a sudden confusion. I flung him off. I stumbled against the shape of Hans.

The car was almost loose; drifting away.

Without thought—a frantic impulse—I pushed Hans over the brink. He fell into the car. It swayed into an oscillation with the impact. The balloon sank below our wing level and was gone, with only Hans, muffled shouts floating up.

And De Boer came leaping at me from behind. I whirled around. My danger was too much for the watching Jetta. She screamed.

"Philip, look out for him!"

"Hah! The American. By damn, what is this?"

It gave De Boer pause. He gripped a wing stay-wire

for a second.

Then he came with a rush.

The corridor door was open behind me. I flung myself into it—and collided with a shape.

"Philip!"

I shoved at her frantically.

"Jetta, get back! Away from us!"

I pulled at her, half falling. De Boer's shape came through the doorway into the corridor. And was blotted out in the green darkness as he turned the other way, to avoid me if I struck.

A silence. The shadow of Jetta was behind me. I stood with poised knife, listening, straining my eyes through the faint green darkness. De Boer was here, knife in hand, fallen now into craftly, motionless silence. He might have been close here down the corridor. Or in any one of these nearby cubby

doorways.

I slid forward along the wall. The corridor was solid black down its length: the green radiance seemed brighter at the control room behind me. Had De Boer gone into this solid blackness, to lure me?

I

stopped my advance. Stood again, trying to see or hear something.

And then I saw him! Two small glowing points of light. Distant stars. His eyes! Five feet ahead of me? Or ten? Or twenty?

A rustle. A sound.

His dark form materialized as he came—a huge, black blob overwhelming me, his arm and knife blade striking.

I dropped to the floor-grid, and his blade went over me. And as I dropped, I struck with an upward thrust. My knife met solidity; sank into flesh.

I twisted past him on the floor as he fell. My knife was gone: buried in him.

Words were audible; choking gasps. I could see his form rising, staggering. The open porte was near him; he swayed through it.

Did he know he was mortally wounded? I think so. He swayed on the wing runway, and I slid to the door and stood watching. And was aware of the shadow of Jetta creeping to join me.

"Is he—?"

"Quiet, Jetta."

He stood under the wing, swaying, gripping a stay. Then his voice sounded, and it seemed like a laugh.

"The craven American—wins." He moved a step. "Not

to see—me die—"

He toppled at the rail. "Good-by, Jetta."

A great huddled shadow. A blob, toppling, falling....

Far down there now the crags and peaks of the Lowland depths were visible. The darkness swallowed his whirling body. We could not hear the impact.

Chapter 19: Episode of the Lowlands

There is but little remaining for me to record. I could not operate the mechanism of invisibility of De Boer's X-flyer. But its pilot controls were simple. With Jetta at my side, trembling now that our gruesome task was over, we groped our way through the green darkness and mounted to the pilot cubby. And within ten minutes I had lowered the ship into the depths, found a landing place upon the dark rocks, and brought us down.

Hanley's Wasp had landed: we saw its lights half a mile from us. And then the lights of another ship—an X-flyer convoying Hanley—slowly materializing nearby.

And then reunion. Jetta and I left De Boer's invisible vessel and clambered over the rocks. And presently Hanley, staring at our grotesque black forms, came rushing forward and greeted us.

We were an hour locating De Boer's flyer, for all that Jetta and I had just left it and thought we could find

our way back. But we stumbled onto it at last. Hanley felt his way aboard and brought it to visibility. It has since been returned to the Anti-War Department, with the compliments of Hanley's Office.

The ransom money was restored to its proper source. Spawn's treasure of radiumized quicksilver we shipped back to Nareda, where it was checked and divided, and Jetta's share legally awarded to her.

De Boer was dead when Hanley found him that night on the rocks. Jetta and I did not go to look at him....

The balloon basket landed safely. Hanley and his men were down there in time to seize it. Hans was caught; and Gutierrez, within the sack, was found to be uninjured. They are incarcerated now in Nareda. They were willing to tell the location of the bandit stronghold. A raid there the following day resulted in the capture of most of De Boer's men.

All this is now public news. You have heard it, of course. Yet in my narrative, setting down the events as I lived them, I have tried to give more vivid details

than the bare facts as they were blared through the public audiphones.

An episode of the strange, romantic, fantastic Lowlands. A very unimportant series of incidents mingled with the news of a busy world—just a few minutes of the newscasters' time to tell how a band of depth smugglers was caught.

But it was a very important episode to me. It changed, for me, a clanking, thrumming machine-made world into a shining fairyland of dreams come true. It gave me little Jetta.

#48 The Terrible Tentacles, Of L-472, By Sewell Peaslee Wright:

Commander John Hanson of the Special Patrol Service records another of his thrilling interplanetary assignments.

lurching toward us

It was a big mistake. I should not have done it. By birth, by instinct, by training, by habit, I am a man of action. Or I was. It is queer that an old man cannot remember that he is no longer young.

Commander John Hanson of the Special Patrol Service records another of his thrilling interplanetary assignments.

But it was a mistake for me to mention that I had recorded, for the archives of the Council, the history of a certain activity of the Special Patrol—a bit of secret history which may not be mentioned here. Now they insist—by "they" I refer to the Chiefs of the Special Patrol Service—that I write of other achievements of the Service, other adventures worthy of note.

Perhaps that is the penalty of becoming old. From commander of the *Budi*, one of the greatest of the Special Patrol ships, to the duties of recording ancient history, for younger men to read and dream about. That is a shrewd blow to one's pride.

But if I can, in some small way, add luster to the record of my service, it will be a fitting task for a man grown old and gray in that service; work for hands too weak and palsied for sterner duties.

But I shall tell my stories in my own way; after all, they are my stories. And I shall tell the stories that appeal to me most. The universe has had enough and too much of dry history; these shall be adventurous tales to make the blood of a young man who reads them run a trifle faster—and perhaps the blood of the old man who writes them.

This, the first, shall be the story of the star L-472. You know it to-day as Ibit, port-o'-call for interplanetary ships, and source of ocrate for the universe, but to me it will always be L-472, the world of terrible tentacles.

My story begins nearly a hundred years ago—reckoned in terms of Earth time, which is proper, since I am a native of Earth—when I was a young man. I was sub-commander, at the time, of the *Kalid*, one of the early ships of the Special Patrol.

We had been called to Zenia on special orders, and Commander Jamison, after an absence of some two hours, returned to the *Kalid* with his face shining, one of his rare smiles telling me in advance that he had news—and good news.

He hurried me up to the deserted navigating room and waved me to a seat.

"Hanson," he said. "I'm glad to be the first to congratulate you. You are now Commander John Hanson, of the Special Patrol Ship *Kalid*!"

"Sir." I gasped, "do you mean—"

His smile broadened. From the breast pocket of the trim blue and silver uniform of our Service he drew a long, crackling paper.

"Your commission," he said. "I'm taking over the *Borelis*."

It was my turn to extend congratulations then; the *Borelis* was the newest and greatest ship of the

Service. We shook hands, that ancient gesture of good-fellowship on Earth. But, as our hands unclasped, Jamison's face grew suddenly grave.

"I have more than this news for you, however," he said slowly. "You are to have a chance to earn your comet hardly."

I smiled broadly at the mention of the comet, the silver insignia, worn over the heart, that would mark my future rank as commander, replacing the four-rayed star of a sub-commander which I wore now on my tunic.

"Tell me more, sir," I said confidently.

"You have heard of the Special Patrol Ship *Filanus*?" asked my late commander gravely.

"Reported lost in space," I replied promptly.

"And the *Dorlos*?"

"Why—yes; she was at Base here at our last call," I

said, searching his face anxiously. "Peter Wilson was Second Officer on her—one of my best friends. Why do you ask about her, sir?"

"The *Dorlos* is missing also," said Commander Jamison solemnly. "Both of these ships were sent upon a particular mission. Neither of them has returned. It is concluded that some common fate has overtaken them. The *Kalid*, under your command, is commissioned to investigate these disappearances.

"You are not charged with the mission of these other ships; your orders are to investigate their disappearance. The course, together with the official patrol orders, I shall hand you presently, but with them go verbal orders.

"You are to lay and keep the course designated, which will take you well out of the beaten path to a small world which has not been explored, but which has been circumnavigated a number of times by various ships remaining just outside the atmospheric envelope, and found to be without evidence of intelligent habitation. In other words, without cities,

roads, canals, or other evidence of human handiwork or civilization.

I believe your instructions give you some of this information, but not all of it. This world, unnamed because of its uninhabited condition, is charted only as L-472. Your larger charts will show it, I am sure. The atmosphere is reported to be breathable by inhabitants of Earth and other beings having the same general requirements. Vegetation is reported as dense, covering the five continents of the world to the edges of the northern and southern polar caps, which are small. Topographically, the country is rugged in the extreme, with many peaks, apparently volcanic, but now inactive or extinct, on all of its five large continents."

"And am I to land there, sir?" I asked eagerly.

"Your orders are very specific upon that point," said Commander Jamison. "You are not to land until you have carefully and thoroughly reconnoitered from above, at low altitude. You will exercise every possible precaution. Your specific purpose is simply this: to

determine, if possible, the fate of the other two ships, and report your findings at once. The Chiefs of the Service will then consider the matter, and take whatever action may seem advisable to them."

Jamison rose to his feet and thrust out his hand in Earth's fine old salute of farewell.

"I must be going, Hanson," he said. "I wish this patrol were mine instead of yours. You are a young man for such a responsibility."

"But," I replied, with the glowing confidence of youth, "I have the advantage of having served under Commander Jamison!"

He smiled as we shook again, and shook his head.

"Discretion can be learned only by experience," he said. "But I wish you success, Hanson; on this undertaking, and on many others. Supplies are on their way now; the crew will return from leave within the hour. A young Zenian, name of Dival, I believe, is detailed to accompany you as scientific observer—purely unofficial capacity, of course. He has been

ordered to report to you at once. You are to depart as soon as feasible: you know what that means. I believe that's all—Oh, yes! I had almost forgotten.

"Here, in this envelope, are your orders and your course, as well as all available data on L-472. In this little casket is—your comet, Hanson. I know you will wear it with honor!"

"Thank you, sir!" I said, a bit huskily. I saluted, and Commander Jamison acknowledged the gesture with stiff precision. Commander Jamison always had the reputation of being something of a martinet.

When he had left, I picked up the thin blue envelope he had left. Across the face of the envelope, in the—to my mind—jagged and unbeautiful Universal script, was my name, followed by the proud title:
"*Commander, Special Patrol Ship Kalid.*" My first orders!

There was a small oval box, of blue leather, with the silver crest of the Service in bas-relief on the lid. I opened the case, and gazed with shining eyes at the

gleaming, silver comet that nestled there.

Then, slowly, I unfastened the four-rayed star on my left breast, and placed in its stead the insignia of my commandership.

Worn smooth and shiny now, it is still my most precious possession.

Kincaide, my second officer, turned and smiled as I entered the navigating room.

"L-472 now registers maximum attraction, sir," he reported. "Dead ahead, and coming up nicely. My last figures, completed about five minutes ago, indicate that we should reach the gaseous envelope in about ten hours." Kincaide was a native of Earth, and we commonly used Earth time-measurements in our conversation. As is still the case, ships of the Special Patrol Service were commanded without exception by natives of Earth, and the entire officer personnel hailed largely from the same planet, although I have had several Zenian officers of rare ability and courage.

I nodded and thanked him for the report. Maximum attraction, eh? That, considering the small size of our objective, meant we were much closer to L-472 than to any other regular body.

Mechanically, I studied the various dials about the room. The attraction meter, as Kincaide had said, registered several degrees of attraction, and the red slide on the rim of the dial was squarely at the top, showing that the attraction was coming from the world at which our nose was pointed. The surface-temperature gauge was at normal. Internal pressure, normal. Internal moisture-content, a little high. Kincaide, watching me, spoke up:

"I have already given orders to dry out, sir," he said.

"Very good, Mr. Kincaide. It's a long trip, and I want the crew in good condition." I studied the two charts, one showing our surroundings laterally, the other vertically, all bodies about us represented as glowing spots of green light, of varying sizes; the ship itself as a tiny scarlet spark. Everything shipshape: perhaps, a degree or two of elevation when we were a little

closer—

"May I come in sir?" broke in a gentle, high-pitched voice.

"Certainly, Mr. Dival," I replied, answering in the Universal language in which the request had been made. "You are always very welcome." Dival was a typical Zenian of the finest type: slim, very dark, and with the amazingly intelligent eyes of his kind. His voice was very soft and gentle, and like the voice of all his people, clear and high-pitched.

"Thank you," he said. "I guess I'm over-eager, but there's something about this mission of ours that worries me. I seem to feel—" He broke off abruptly and began pacing back and forth across the room.

I studied him, frowning. The Zenians have a strange way of being right about such things; their high-strung, sensitive natures seem capable of responding to those delicate, vagrant forces which even now are only incompletely understood and classified.

"You're not used to work of this sort," I replied, as bluffly and heartily as possible. "There's nothing to worry about."

"The commanders of the two ships that disappeared probably felt the same way, sir," said Dival. "I should have thought the Chiefs of the Special Patrol Service would have sent several ships on a mission such as this."

"Easy to say," I laughed bitterly. "If the Council would pass the appropriations we need, we might have ships enough so that we could send a fleet of ships when we wished. Instead of that, the Council, in its infinite wisdom, builds greater laboratories and schools of higher learning—and lets the Patrol get along as best it can."

"It was from the laboratories and the schools of higher learning that all these things sprang," replied Dival quietly, glancing around at the array of instruments which made navigation in space possible.

"True," I admitted rather shortly. "We must work

together. And as for what we shall find upon the little world ahead, we shall be there in nine or ten hours. You may wish to make some preparations."

"Nine or ten hours? That's Earth time, isn't it? Let's see: about two and a half enaros."

"Correct," I smiled. The Universal method of reckoning time had never appealed to me. For those of my readers who may only be familiar with Earth time measurements, an enar is about eighteen Earth days, an enaren a little less than two Earth days, and an enaro nearly four and a half hours. The Universal system has the advantage, I admit, of a decimal division; but I have found it clumsy always. I may be stubborn and old-fashioned, but a clock face with only ten numerals and one hand still strikes me as being unbeautiful and inefficient.

"Two and a half enaros," repeated Dival thoughtfully. "I believe I shall see if I can get a little sleep now; I should not have brought my books with me, I'm afraid. I read when I should sleep. Will you call me should there be any developments of interest?"

I assured him that he would be called as he requested, and he left.

"Decent sort of a chap, sir," observed Kincaide, glancing at the door through which Dival had just departed.

"A student," I nodded, with the contempt of violent youth for the man of gentler pursuits than mine, and turned my attentions to some calculations for entry in the log.

Busied with the intricate details of my task, time passed rapidly. The watch changed, and I joined my officers in the tiny, arched dining salon. It was during the meal that I noticed for the first time a sort of tenseness; every member of the mess was unusually quiet. And though I would not, have admitted it then, I was not without a good deal of nervous restraint myself.

"Gentlemen," I remarked when the meal was finished, "I believe you understand our present mission. Primarily, our purpose is to ascertain, if possible, the

fate of two ships that were sent here and have not returned. We are now close enough for reasonable observation by means of the television disc, I believe, and I shall take over its operation myself.

"There is no gainsaying the fact that whatever fate overtook the two other Patrol ships, may lay in wait for us. My orders are to observe every possible precaution, and to return with a report. I am going to ask that each of you proceed immediately to his post, and make ready, in so far as possible, for any eventuality. Warn the watch which has just gone off to be ready for instant duty. The disintegrator ray generators should be started and be available for instant emergency use, maximum power. Have the bombing crews stand by for orders."

"What do you anticipate, sir?" asked Correy, my new sub-commander. The other officers waited tensely for my reply.

"I don't know, Mr. Correy," I admitted reluctantly. "We have no information upon which to base an assumption. We do know that two ships have been

sent here, and neither of them have returned. Something prevented that return. We must endeavor to prevent that same fate from overtaking the *Kalid*—and ourselves."

Hurrying back to the navigating room, I posted myself beside the cumbersome, old-fashioned television instrument. L-472 was near enough now to occupy the entire field, with the range hand at maximum. One whole continent and parts of two others were visible. Not many details could be made out.

I waited grimly while an hour, two hours, went by. My field narrowed down to one continent, to a part of one continent. I glanced up at the surface temperature gauge and noted that the hand was registering a few degrees above normal. Correy, who had relieved Kincaide as navigating officer, followed my gaze.

"Shall we reduce speed, sir?" he asked crisply.

"To twice atmospheric speed," I nodded. "When we enter the envelope proper, reduce to normal atmospheric speed. Alter your course upon entering

the atmosphere proper, and work back and forth along the emerging twilight zone, from the north polar cap to the southern cap, and so on."

"Yes, sir!" he replied, and repeated the orders to the control room forward.

I pressed the attention signal to Dival's cubicle, and informed him that we were entering the outer atmospheric fringe.

"Thank you, sir!" he said eagerly. "I shall be with you immediately."

In rapid succession I called various officers and gave terse orders. Double crews on duty in the generator compartment, the ray projectors, the atomic bomb magazines, and release tubes. Observers at all observation posts, operators at the two smaller television instruments to comb the terrain and report instantly any object of interest. With the three of us searching, it seemed incredible that anything could escape us. At atmospheric altitudes even the two smaller television instruments would be able to pick

out a body the size of one of the missing ships.

Dival entered the room as I finished giving my orders.

"A strange world, Dival," I commented, glancing towards the television instrument. "Covered with trees, even the mountains, and what I presume to be volcanic peaks. They crowd right down to the edge of the water."

He adjusted the focusing lever slightly, his face lighting up with the interest of a scientist gazing at a strange specimen, whether it be a microbe or a new world.

"Strange ... strange ..." he muttered. "A universal vegetation ... no variation of type from equator to polar cap, apparently. And the water—did you notice its color, sir?"

"Purple," I nodded. "It varies on the different worlds, you know. I've seen pink, red, white and black seas, as well as the green and blue of Earth."

"And no small islands," he went on, as though he had not ever heard me. "Not in the visible portion, at any rate."

I was about to reply, when I felt the peculiar surge of the *Kalid* as she reduced speed. I glanced at the indicator, watching the hand drop slowly to atmospheric speed.

"Keep a close watch, Dival," I ordered. "We shall change our course now, to comb the country for traces of two ships we are seeking. If you see the least suspicious sign, let me know immediately."

He nodded, and for a time there was only a tense silence in the room, broken at intervals by Correy as he spoke briefly into his microphone, giving orders to the operating room.

Perhaps an hour went by. I am not sure. It seemed like a longer time than that. Then Dival called out in sudden excitement, his high, thin voice stabbing the silence:

"Here, sir! Look! A little clearing—artificial, I judge—and the ships! Both of them!"

"Stop the ship, Mr. Correy!" I snapped as I hurried to the instrument. "Dival, take those reports." I gestured towards the two attention signals that were glowing and softly humming and thrust my head into the shelter of the television instrument's big hood.

Dival had made no mistake. Directly beneath me, as I looked, was a clearing, a perfect square with rounded corners, obviously blasted out of the solid forest by the delicate manipulation of sharply focused disintegrator rays. And upon the naked, pitted surface thus exposed, side by side in orderly array, were the missing ships!

I studied the strange scene with a heart that thumped excitedly against my ribs.

What should I do? Return and report? Descend and investigate? There was no sign of life around the ships, and no evidence of damage. If I brought the *Kalid* down, would she make a third to remain there,

to be marked "lost in space" on the records of the Service?

Reluctantly, I drew my head from beneath the shielding hood.

"What were the two reports, Dival?" I asked, and my voice was thick. "The other two television observers?"

"Yes, sir. They report that they cannot positively identify the ships with their instruments, but feel certain that they are the two we seek."

"Very good. Tell them, please, to remain on watch, searching space in every direction, and to report instantly anything suspicious. Mr. Correy, we will descend until this small clearing becomes visible, through the ports, to the unaided eye. I will give you the corrections to bring us directly over the clearing." And I read the finder scales of the television instrument to him.

He rattled off the figures, calculated an instant, and gave his orders to the control room, while I kept the

television instrument bearing upon the odd clearing and the two motionless, deserted ships.

As we settled, I could make out the insignia of the ships, could see the pitted, stained earth of the clearing, brown with the dust of disintegration. I could see the surrounding trees very distinctly now: they seemed very similar to our weeping willows, on Earth, which, I perhaps should explain, since it is impossible for the average individual to have a comprehensive knowledge of the flora and fauna of the entire known Universe, is a tree of considerable size, having long, hanging branches arching from its crown and reaching nearly to the ground. These leaves, like typical willow leaves, were long and slender, of rusty green color. The trunks and branches seemed to be black or dark brown: and the trees grew so thickly that nowhere between their branches was the ground visible.

"Five thousand feet, sir," said Correy. "Directly above the clearing. Shall we descend further?"

"A thousand feet at a time, Mr. Correy," I replied,

after a moment's hesitation. "My orders are to exercise the utmost caution. Mr. Dival, please make a complete analysis of the atmosphere. I believe you are familiar with the traps provided for the purpose?"

"Yes. You propose to land, sir?"

"I propose to determine the fate of those two ships and the men who brought them here," I said with sudden determination. Dival made no reply, but as he turned to obey orders, I saw that his presentiment of trouble had not left him.

"Four thousand feet, sir," said Correy.

I nodded, studying the scene below us. The great hooded instrument brought it within, apparently, fifty feet of my eyes, but the great detail revealed nothing of interest.

The two ships lay motionless, huddled close together. The great circular door of each was open, as though opened that same day—or a century before.

"Three thousand feet, sir," said Correy.

"Proceed at the same speed," I replied. Whatever fate had overtaken the men of the other ships had caused them to disappear entirely—and without sign of a struggle. But what conceivable fate could that be?

"Two thousand feet, sir," said Correy.

"Good," I said grimly. "Continue with the descent, Mr. Correy."

Dival hurried into the room as I spoke. His face was still clouded with foreboding.

"I have tested the atmosphere, sir," he reported. "It is suitable for breathing by either men of Earth or Zenia. No trace of noxious gases of any kind. It is probably rather rarified, such as one might find on Earth or Zenia at high altitudes."

"One thousand feet, sir," said Correy.

I hesitated an instant. Undoubtedly the atmosphere

had been tested by the other ships before they landed. In the case of the second ship, at any rate, those in command must have been on the alert against danger. And yet both of those ships lay there motionless, vacant, deserted.

I could feel the eyes of the men on me. My decision must be delayed no further.

"We will land, Mr. Correy," I said grimly. "Near the two ships, please."

"Very well, sir," nodded Correy, and spoke briefly into the microphone.

"I might warn you, sir," said Dival quietly, "to govern your activities, once outside: free from the gravity pads of the ship, on a body of such small size, an ordinary step will probably cause a leap of considerable distance."

"Thank you, Mr. Dival. That is a consideration I had overlooked. I shall warn the men. We must—"

At that instant I felt the slight jar of landing. I glanced up; met Correy's grave glance squarely.

"Grounded, sir," he said quietly.

"Very good, Mr. Correy. Keep the ship ready for instant action, please, and call the landing crew to the forward exit. You will accompany us, Mr. Dival?"

"Certainly, sir!"

"Good. You understand your orders, Mr. Correy?"

"Yes, sir!"

I returned his salute, and led the way out of the room, Dival close on my heels.

The landing crew was composed of all men not at regular stations; nearly half of the *Kalid's* entire crew. They were equipped with the small atomic power pistols as side-arms, and there were two three-men disintegrator ray squads. We all wore menores, which were unnecessary in the ship, but decidedly useful

outside. I might add that the menore of those days was not the delicate, beautiful thing that it is to-day: it was comparatively crude, and clumsy band of metal, in which were imbedded the vital units and the tiny atomic energy generator, and was worn upon the head like a crown. But for all its clumsiness, it conveyed and received thought, and, after all, that was all we demanded of it.

I caught a confused jumble of questioning thoughts as I came up, and took command of the situation promptly. It will be understood, of course, that in those days men had not learned to blank their minds against the menore, as they do to-day. It took generations of training to perfect that ability.

"Open the exit," I ordered Kincaide, who was standing by the switch, key in the lock.

"Yes, sir," he thought promptly, and unlocking the switch, released the lever.

The great circular door revolved swiftly, backing slowly on its fine threads, gripped by the massive

gimbals which, as at last the ponderous plug of metal freed itself from its threads, swung the circular door aside, like the door of a vault.

Fresh clean air swept in, and we breathed, it gratefully. Science can revitalize air, take out impurities and replace used-up constituents, but it cannot give it the freshness of pure natural air. Even the science of to-day.

"Mr. Kincaide, you will stand by with five men. Under no circumstances are you to leave your post until ordered to do so. No rescue parties, under any circumstances, are to be sent out unless you have those orders directly from me. Should any untoward thing happen to this party, you will instantly reseal this exit, reporting at the same time to Mr. Correy, who has his orders. You will not attempt to rescue us, but will return to the Base and report in full, with Mr. Correy in command. Is that clear?"

"Perfectly," came back his response instantly; but I could sense the rebellion in his mind. Kincaid and I were old friends, as well as fellow officers.

I smiled at him reassuringly, and directed my orders to the waiting men.

"You are aware of the fate of the two ships of the Patrol that have already landed here," I thought slowly, to be sure they understood perfectly. "What fate overtook them, I do not know. That is what we are here to determine."

"It is obvious that this is a dangerous mission. I'm ordering none of you to go. Any man who wishes to be relieved from landing duty may remain inside the ship, and may feel it no reproach. Those who do go should be constantly on the alert, and keep in formation; the usual column of twos. Be very careful, when stepping out of the ship, to adjust your stride to the lessened gravity of this small world. Watch this point!" I turned to Dival, motioned him to fall in at my side. Without a backward glance, we marched out of the ship, treading very carefully to keep from leaping into the air with each step.

Twenty feet away, I glanced back. There were fourteen men behind me—not a man of the landing

crew had remained in the ship!

"I am proud of you men!" I thought heartily: and no emanation from any man was ever more sincere.

Cautiously, eyes roving ceaselessly, we made our way towards the two silent ships. It seemed a quiet, peaceful world: an unlikely place for tragedy. The air was fresh and clean, although, as Dival had predicted, rarefied like the air at an altitude. The willow-like trees that hemmed us in rustled gently, their long, frond-like branches with their rusty green leaves swaying.

"Do you notice, sir," came a gentle thought from Dival, an emanation that could hardly have been perceptible to the men behind us, "that there is no wind—and yet the trees, yonder, are swaying and rustling?"

I glanced around, startled. I had not noticed the absence of a breeze.

I tried to make my response reassuring:

"There is probably a breeze higher up, that doesn't dip down into this little clearing," I ventured. "At any rate, it is not important. These ships are what interest me. What will we find there?"

"We shall soon know," replied Dival. "Here is the *Dorlos*; the second of the two, was it not?"

"Yes." I came to a halt beside the gaping door. There was no sound within, no evidence of life there, no sign that men had ever crossed that threshold, save that the whole fabric was the work of man's hands.

"Mr. Dival and I will investigate the ship, with two of you men," I directed. "The rest of the detail will remain on guard, and give the alarm at the least sign of any danger. You first two men, follow us." The indicated men nodded and stepped forward. Their "Yes, sirs" came surging through my menore like a single thought. Cautiously, Dival at my side, the two men at our backs, we stepped over the high threshold into the interior of the *Dorlos*.

The *ethon* tubes overhead made everything as light as

day, and since the *Dorlos* was a sister ship of my own *Kalid*, I had not the slightest difficulty in finding my way about.

There was no sign of a disturbance anywhere. Everything was in perfect order. From the evidence, it would seem that the officers and men of the *Dorlos* had deserted the ship of their own accord, and—failed to return.

"Nothing of value here," I commented to Dival. "We may as well—"

There was a sudden commotion from outside the ship. Startled shouts rang through the hollow hull, and a confused medley of excited thoughts came pouring in.

With one accord the four of us dashed to the exit, Dival and I in the lead. At the door we paused, following the stricken gaze of the men grouped in a rigid knot just outside.

Some, forty feet away was the edge of the forest that hemmed us in. A forest that now was lashing and

writhing as though in the grip of some terrible hurricane, trunks bending and whipping, long branches writhing, curling, lashing out—

"Two of the men, sir!" shouted a non-commissioned officer of the landing crew, as we appeared in the doorway. In his excitement he forgot his menore, and resorted to the infinitely slower but more natural speech. "Some sort of insect came buzzing down—like an Earth bee, but larger. One of the men slapped it, and jumped aside, forgetting the low gravity here. He shot into the air, and another of the men made a grab for him. They both went sailing, and the trees—*look!*"

But I had already spotted the two men. The trees had them in their grip, long tentacles curled around them, a dozen of the great willow-like growths apparently fighting for possession of the prizes. And all around, far out of reach, the trees of the forest were swaying restlessly, their long, pendulous branches, like tentacles, lashing out hungrily.

"The rays, sir!" snapped the thought from Dival, like a flash of lightning. "Concentrate the beams—strike at

the trunks—"

"Right!" My orders emanated on the heels of the thought more quickly than one word could have been uttered. The six men who operated the disintegrator rays were stung out of their startled immobility, and the soft hum of the atomic power generators deepened.

"Strike at the trunks of the trees! Beams narrowed to minimum! Action at will!"

The invisible rays swept long gashes into the forest as the trainers squatted behind their sights, directing the long, gleaming tubes. Branches crashed to the ground, suddenly motionless. Thick brown dust dropped heavily. A trunk, shortened by six inches or so, dropped into its stub and fell with a prolonged sound of rending wood. The trees against which it had fallen tugged angrily at their trapped tentacles.

One of the men rolled free, staggered to his feet, and came lurching towards us. Trunk after trunk dropped onto its severed stub and fell among the lashing

branches of its fellows. The other man was caught for a moment in a mass of dead and motionless wood, but a cunningly directed ray dissolved the entangling branches around him and he lay there, free but unable to arise.

The rays played on ruthlessly. The brown, heavy powder was falling like greasy soot. Trunk after trunk crashed to the ground, slashed into fragments.

"Cease action!" I ordered, and instantly the eager whine of the generators softened to a barely discernible hum. Two of the men, under orders, raced out to the injured man: the rest of us clustered around the first of the two to be freed from the terrible tentacles of the trees.

His menore was gone, his tight-fitting uniform was in shreds, and blotched with blood. There was a huge crimson welt across his face, and blood dripped slowly from the tips of his fingers.

"*God!*" he muttered unsteadily as kindly arms lifted him with eager tenderness. "They're alive! Like

snakes. They—they're *hungry*!"

"Take him to the ship," I ordered. "He is to receive treatment immediately," I turned to the detail that was bringing in the other victim. The man was unconscious, and moaning, but suffering more from shock than anything else. A few minutes under the helio emanations and he would be fit for light duty.

As the men hurried him to the ship, I turned to Dival. He was standing beside me, rigid, his face very pale, his eyes fixed on space.

"What do you make of it, Mr. Dival?" I questioned him.

"Of the trees?" He seemed startled, as though I had aroused him from deepest thought. "They are not difficult to comprehend, sir. There are numerous growths that are primarily carnivorous. We have the fital vine on Zenia, which coils instantly when touched, and thus traps many small animals which it wraps about with its folds and digests through sucker-like growths.

"On your own Earth there are, we learn, hundreds of varieties of insectivorous plants: the Venus fly-trap, known otherwise as the *Dionaea Muscipula*, which has a leaf hinged in the median line, with teeth-like bristles. The two portions of the leaf snap together with considerable force when an insect alights upon the surface, and the soft portions of the catch are digested by the plant before the leaf opens again. The pitcher plant is another native of Earth, and several varieties of it are found on Zenia and at least two other planets. It traps its game without movement, but is nevertheless insectivorous. You have another species on Earth that is, or was, very common: the *Mimosa Pudica*. Perhaps you know it as the sensitive plant. It does not trap insects, but it has a very distinct power of movement, and is extremely irritable.

"It is not at all difficult to understand a carnivorous tree, capable of violent and powerful motion. This is undoubtedly what we have here—a decidedly interesting phenomena, but not difficult of comprehension."

It seems like a long explanation, as I record it here, but emanated as it was, it took but an instant to complete it. Mr. Dival went on without a pause:

"I believe, however, that I have discovered something far more important. How is your menore adjusted, sir?"

"At minimum."

"Turn it to maximum, sir."

I glanced at him curiously, but obeyed. New streams of thought poured in upon me. Kincaide ... the guard at the exit ... *and something else*.

I blanked out Kincaide and the men, feeling Dival's eyes searching my face. There was something else, something—

I focused on the dim, vague emanations that came to me from the circlet of my menore, and gradually, like an object seen through heavy mist, I perceived the message:

"Wait! Wait! We are coming! Through the ground. The trees ... disintegrate them ... all of them ... all you can reach. But not the ground ... not the ground...."

"Peter!" I shouted, turning to Dival. "That's Peter Wilson, second officer of the *Dorlos*!"

Dival nodded, his dark face alight.

"Let us see if we can answer him," he suggested, and we concentrated all our energy on a single thought: "We understand. We understand."

The answer came back instantly:

"Good! Thank God! Sweep them down, Hanson: every tree of them. Kill them ... kill them ... kill them!" The emanation fairly shook with hate. "We are coming ... to the clearing ... wait—and while you wait, use your rays upon these accursed hungry trees!"

Grimly and silently we hurried back to the ship. Dival, the savant, snatching up specimens of earth and rock here and there as we went.

The disintegrator rays of the portable projectors were no more than toys compared with the mighty beams the *Kalid* was capable of projecting, with her great generators to supply power. Even with the beams narrowed to the minimum, they cut a swath a yard or more in diameter, and their range was tremendous; although working rather less rapidly as the distance and power decreased, they were effective over a range of many miles.

Before their blasting beams the forest shriveled and sank into tumbled chaos. A haze of brownish dust hung low over the scene, and I watched with a sort of awe. It was the first time I had ever seen the rays at work on such wholesale destruction.

A startling thing became evident soon after we began our work. This world that we had thought to be void of animal life, proved to be teeming with it. From out of the tangle of broken and harmless branches, thousands of animals appeared. The majority of them were quite large, perhaps the size of full-grown hogs, which Earth animal they seemed to resemble, save that they were a dirty yellow color, and had strong,

heavily-clawed feet. These were the largest of the animals, but there were myriads of smaller ones, all of them pale or neutral in color, and apparently unused to such strong light, for they ran blindly, wildly seeking shelter from the universal confusion.

Still the destructive beams kept about their work, until the scene changed utterly. Instead of resting in a clearing, the *Kalid* was in the midst of a tangle of fallen, wilting branches that stretched like a great, still sea, as far as the eye could see.

"Cease action!" I ordered suddenly. I had seen, or thought I had seen, a human figure moving in the tangle, not far from the edge of the clearing. Correy relayed the order, and instantly the rays were cut off. My menore, free from the interference of the great atomic generators of the *Kalid*, emanated the moment the generators ceased functioning.

"Enough. Hanson! Cut the rays; we're coming."

"We have ceased action; come on!"

I hurried to the still open exit. Kincaide and his guards were staring at what had been the forest; they were so intent that they did not notice I had joined them—and no wonder!

A file of men were scrambling over the debris; gaunt men with dishevelled hair, practically naked, covered with dirt and the greasy brown dust of the disintegrator ray. In the lead, hardly recognizable, his menore awry upon his tangled locks, was Peter Wilson.

"Wilson!" I shouted; and in a single great leap I was at his side, shaking his hand, one arm about his scarred shoulders, laughing and talking excitedly, all in the same breath. "Wilson, tell me—in God's name—what has happened?"

He looked up at me with shining, happy eyes, deep in black sockets of hunger and suffering.

"The part that counts," he said hoarsely, "is that you're here, and we're here with you. My men need rest and food—not too much food, at first, for we're

starving. I'll give you the story—or as much of it as I know—while we eat."

I sent my orders ahead; for every man of that pitiful crew of survivors, there were two eager men of the *Kalid's* crew to minister to him. In the little dining salon of the officers' mess, Wilson gave us the story, while he ate slowly and carefully, keeping his ravenous hunger in check.

"It's a weird sort of story," he said. "I'll cut it as short as I can. I'm too weary for details.

"The *Dorlos*, as I suppose you know, was ordered to L-472 to determine the fate of the *Filanus*, which had been sent here to determine the feasibility of establishing a supply base here for a new interplanetary ship line.

"It took us nearly three days, Earth time, to locate this clearing and the *Filanus*, and we grounded the *Dorlos* immediately. Our commander—you probably remember him, Hanson: David McClellan? Big, red-faced chap?"

I nodded, and Wilson continued.

"Commander McClellan was a choleric person, as courageous a man as ever wore the blue and silver of the Service, and very thoughtful of his men. We had had a bad trip; two swarms of meteorites that had worn our nerves thin, and a faulty part in the air-purifying apparatus had nearly done us in. While the exit was being unsealed, he gave the interior crew permission to go off duty, to get some fresh air, with orders, however, to remain close to the ship, under my command. Then, with the usual landing crew, he started for the *Filanus*.

"He had forgotten, under the stress of the moment, that the force of gravity would be very small on a body no larger than this. The result was that as soon as they hurried out of the ship, away from the influence of our own gravity pads, they hurtled into the air in all directions."

Wilson paused. Several seconds passed before he could go on.

"Well, the trees—I suppose you know something about them—reached out and swept up three of them.

McClellan and the rest of the landing crew rushed to their rescue. They were caught up. *God!* I can see them ... hear them ... even now!

"I couldn't stand there and see that happen to them. With the rest of the crew behind me, we rushed out, armed only with our atomic pistols. We did not dare use the rays; there were a dozen men caught up everywhere in those hellish tentacles.

"I don't know what I thought we could do. I knew only that I must do something. Our leaps carried us over the tops of the trees that were fighting for the ... the bodies of McClellan and the rest of the landing crew. I saw then, when it was too late, that there was nothing we could do. The trees ... had done their work. They ... they were *feeding*....

"Perhaps that is why we escaped. We came down in a tangle of whipping branches. Several of my men were snatched up. The rest of us saw how helpless our position was ... that there was nothing we could do.

We saw, too, that the ground was literally honeycombed, and we dived down these burrows, out of the reach of the trees.

"There were nineteen of us that escaped. I can't tell you how we lived—I would not if I could. The burrows had been dug by the pig-like animals that the trees live upon, and they led, eventually, to the shore, where there was water—horrible, bitter stuff, but not salty, and apparently not poisonous."

We lived on these pig-like animals, and we learned something of their way of life. The trees seem to sleep, or become inactive, at night. Not unless they are touched do they lash about with their tentacles. At night the animals feed, largely upon the large, soft fruit of these trees. Of course, large numbers of them make a fatal step each night, but they are prolific, and their ranks do not suffer.

"Of course, we tried to get back to the clearing, and the *Dorlos*; first by tunneling. That was impossible, we found, because the rays used by the *Filanus* in clearing a landing place had acted somewhat upon

the earth beneath, and it was like powder. Our burrows fell in upon us faster than we could dig them out! Two of my men lost their lives that way.

"Then we tried creeping back by night; but we could not see as can the other animals here, and we quickly found that it was suicide to attempt such tactics. Two more of the men were lost in that fashion. That left fourteen.

"We decided then to wait. We knew there would be another ship along, sooner or later. Luckily, one of the men had somehow retained his menore. We treasured that as we treasured our lives. To-day, when, deep in our runways beneath the surface, we felt, or heard, the crashing of the trees, we knew the Service had not forgotten us. I put on the menore; I—but I think you know the rest, gentlemen. There were eleven of us left. We are here—all that is left of the *Dorlos* crew. We found no trace of any survivor of the *Filanus*; unaware of the possibility of danger, they were undoubtedly, all the victims of ... the trees."

Wilson's head dropped forward on his chest. He

straightened up with a start and an apologetic smile.

"I believe, Hanson," he said slowly, "I'd better get ... a little ... rest," and he slumped forward on the table in the death-like sleep of utter exhaustion.

There the interesting part of the story ends. The rest is history, and there is too much dry history in the Universe already.

Dival wrote three great volumes on L-472—or Ibit, as it is called now. One of them tells in detail how the presence of constantly increasing quantities of volcanic ash robbed the soil of that little world of its vitality, so that all forms of vegetation except the one became extinct, and how, through a process of development and evolution, those trees became carnivorous.

The second volume is a learned discussion of the tree itself; it seems that a few specimens were spared for study, isolated on a peninsula of one of the continents, and turned over to Dival for observation and dissection. All I can say for the book is that it is

probably accurate. Certainly it is neither interesting nor comprehensible.

And then, of course, there is his treatise on ocrate: how he happened to find the ore, the probable amount available on L-472—or Ibit, if you prefer—and an explanation of his new method of refining it. I saw him frantically gathering specimens while we were getting ready to leave, but it wasn't until after we had departed that he mentioned what he had found.

I have a set of these volumes somewhere; Dival autographed them and presented me with them. They established his position, I understand, in his world of science, and of course, the discovery of this new source of ocrate was a tremendous find for the whole Universe; interplanetary transportation wouldn't be where it is to-day if it were not for this inexhaustible source of power.

Yes, Dival became famous—and very rich.

I received the handshakes and the gratitude of the eleven men we rescued, and exactly nine words of

commendation from the Chief of my squadron: *"You are a credit to the Service, Commander Hanson!"*

Perhaps, to some who read this, it will seem that Dival fared better than I. But to men who have known the comradeship of the outer space, the heart-felt gratitude of eleven friends is a precious thing. And to any man who has ever worn the blue and silver uniform of the Special Patrol Service, those nine words from the Chief of Squadron will sound strong.

Chiefs of Squadrons in the Special Patrol Service—at least in those days—were scanty with praise. It may be different in these days of soft living and political pull.

#49 Marooned Under The Sea, By Paul Ernst:

Three men stick out a strange and desperate adventure among the incredible monsters of the dark sea floor.

Aproximate word count:

Bigotry:

Warnings:

look at the cable

- - -

(Editor's note: This document, written on a curious kind of parchment and tied to a piece of driftwood, was reported to have been picked out of the sea near the Fiji Islands. The first and last pages were so water soaked as to be indecipherable.)

Yacht *Rosa* was due to leave the San Francisco harbor in two hours.

We were going on some mysterious cruise to the South Seas, the details of which I did not know.

"Professor George Berry, the famous zoologist, and myself are going to do some exploring that is hazardous in the extreme," Stanley had said. "For purely mechanical reasons we need a third. You are young and have no family ties, so I thought I'd ask you to go with us. I'd rather not tell you what it's all about until we are on our way."

"Look at the cable!" called Stanley.

That was all the explanation he had given. It was sufficient. I was fed-up with life just then: I had enough money to avoid work and was tired of playing.

Three men stick out a strange and desperate adventure among the incredible monsters of the dark sea floor.

"I must warn you that you'll risk your life in this," he had continued, in answer to my acceptance of his invitation.

And I had replied that the hazard, whatever it might be, only made the trip appear more desirable.

So here I was, on board the yacht, about to sail for far places on some scientific mission which had so far been kept veiled in secrecy and which was represented as "hazardous in the extreme." It sounded attractive!

Stanley came aboard accompanied by a lean, wiry man with iron gray hair and cool, alert black eyes.

"Hello, Martin," Stanley greeted me. "I want you to meet Professor Berry, the real leader of this expedition. Professor, this young red-head is Martin Grey, a sort of nephew by adoption who knows more about night life than most cabaret proprietors—and not much of anything else. He has shaken the dangers of the gold-diggers to face with us the dangers of the tropic seas."

The professor gripped my hand, and his cool black eyes gazed into mine with a kind of friendly frostiness.

"Don't pay any attention to him," he advised me.

"Twenty years ago, when I first met him, he was on his way to Africa to shoot elephants because some revue beauty had just thrown him over and he felt he ought to do something big and heroic about it. It was shortly afterward that he decided to stay a bachelor all his life, and became such a confirmed woman hater."

He smiled thinly at Stanley's prod in the ribs, and the two went below, talking and laughing with the

intimacy of old friendship.

I stayed on deck and soon found myself watching, with no little wonder, an enormous truck and trailer arrangement that drew up on the dock heavily loaded with a single immense crate. It was for us. I speculated as to what it could possibly contain.

It was a twenty or twenty-five-foot cube solidly braced with strap-iron and steel brackets. It evidently contained something fragile. The yacht's donkey engine lowered a hook for it, and swung it over the side and into the hold as daintily as though it had been packed with explosives.

The last of the ship's stores followed it over the side: the group of newspaper reporters who had been trying to pump the captain and first mate for a story were warned to leave, and we were ready to go. Precisely where and for what purpose?

I was to find out almost immediately.

Even as the yacht nosed superciliously away from the

dock, the steward approached me with the information that lunch was ready. I went to the small, compactly furnished dining salon, where I was joined by Stanley and the professor.

There were only the three of us at the table. Stanley Browne, noted big game hunter and semi-retired owner of the great Browne Glassworks at Altoona, a man fifteen years my senior but tanned and fit looking; Professor Berry, well known in scientific circles; and myself, known in no branch of activity save the one Stanley had jested about—the night life of my home city, Chicago.

"It's time you knew just what you're up against," said Stanley to me after the consomme had been served. "Now that we've actually sailed, there's no longer any need for secrecy. Indeed there never has been urgent need of it: the Professor and myself merely thought we might provoke incredulity and comment if we stated the purpose of our trip publicly."

He buttered a roll.

"We—the Professor and you and I—are going in for some deep sea diving. And when I say deep, I mean deep. We are going to investigate conditions as they exist one mile down from the surface of the ocean."

"A mile!" I exclaimed. "Why—"

There I stopped. I had only a layman's knowledge of such matters. But I knew that the limit of man's submersion, till then at any rate, was a matter of a few hundred feet.

"Sounds incredible, doesn't it," said Stanley with a smile. "But that's what we're going to do—if the Professor's gadget works as he seems to think it will."

"I don't think it, I know it," retorted the Professor. "And man, man, the things we may see down there! New and unknown species—a world no human has ever seen before—perhaps the secret of all of life—"

"Dragons, sea-serpents, and what not!" Stanley finished with a grin.

"Or, possibly—nothing at all." The Professor shrugged. "I mustn't let my scientific curiosity run away with me. Perhaps we'll find no new thing down down. Our deep sea dredging and classification may already embrace most of the forms of life in the greater depths."

"If it does I want my money back," said Stanley. "When you asked me to finance this expedition for you, I agreed on condition that you would show me a thrill—some *real* big game, even if I would not be able to shoot it. If we draw blank—"

"The mere descent should satisfy you, my adventuring friend," replied the Professor brusquely. "I think you'll find that thrilling enough."

"But—a mile under the surface!" I marveled, feeling not entirely comfortable. "The pressure! Enormous! It can't be done! That is, I mean, can it be done?"

"It had better be," said Stanley with a humor that I did not entirely appreciate. "If it isn't, the three of us are going to be pressed out like three sheets of tissue

paper! For we are assuredly going down that far in the Professor's gadget."

"Was that the thing I saw hoisted aboard just before we left?"

"That was it. We'll stroll around after lunch and look it over."

If I had taken this cruise in search of distraction—I was surely going to be successful! That was plain!

"Just where are we going?" I asked. "You said something about the South Seas, but you've named no special part of them."

"We're bound for Penguin Deep. That's a delightful little dimple in the Kermadec Trough, which," Stanley explained, "is north-northeast of New Zealand almost halfway up to the Fiji Islands. Penguin Deep is ticketed at five thousand one hundred and fifty feet, but it probably runs deeper in spots."

The rest of the meal was consumed in silence. I

hardly tasted what I ate; I remember that. Over five thousand feet down—where no man had ever ventured before! Could we make it?

I tried to recall my neglected physics lessons and compute the pressure that far down. I couldn't. But I knew it must be an appalling total of tons to the square inch. What possible arrangement could they have brought in which to make that awful descent?

And, if the descent were accomplished, what in the world would we see when we got down there? Gigantic, hitherto unknown fishes? Marine growths, half animal and half vegetable?

Decidedly, hot rolls and salad, cutlets and baked potatoes, good as they were, could not distract attention from the crowding questions that assailed me. And I could see that Stanley and the Professor were also far away in their thoughts—probably already exploring Penguin Deep.

After lunch we went forward to look at the Professor's gadget, as Stanley insisted on calling it.

It had been carefully unpacked by the crew while we ate, and it shimmered in the electric lighted hold like a great bubble.

It was a giant glass sphere, polished and flawless. Inside it could be made out various objects—a circular bench arrangement on a wooden flooring, batteries that filled the cup between the floor and the bottom arc of the sphere, tall metal cylinders, a small searchlight set next to a mechanism that was indeterminate. At three equidistant points on the sides there were glass handles, as thick as a man's thigh, cast integral with the walls. On the top there was a smaller handle.

At first glance the sphere seemed all in one piece, with the central objects cast inside like a toy ship in a sealed bottle. Then a mathematically precise ring of prismatic reflections showed me that the top third of the ball was a separate piece, fitting conically down like the tapered glass stopper of a monstrous perfume bottle. The handle on the top was for the purpose of lifting this giant's teapot lid, and allowing entrance into the sphere.

"Isn't it a beauty?" murmured Stanley. "It ought to be," he added. "It cost me eighty-six thousand to make it in my own glass factory. Eleven castings before this one came along that was reasonably free of flaws. Twenty-two feet six inches over all, walls five feet thick, new formula unbreakable glass, four men working a month to grind the lid into place, tolerance limits plus or minus zero."

He slapped the Professor's shoulders. "Let's go in and look over the apparatus."

To accommodate the huge ball a well had been constructed in the Rosa's hold. This brought the deck we were standing on up to within six feet of the top ring, above which was rigged a chain hoist for lifting the ponderous lid.

The hoist was revolved, the conical top was swung free, and we clambered into our unique diving shell.

The tall cylinders were revealed as great flasks of compressed air. The indeterminate thing beside the searchlight turned out to be a hand pump, geared to

work against heavy pressure. From the suction chamber of this three tubes extended.

"We inhale the air of the chamber," the Professor explained to me, "and exhale through the tubes into the pump cylinder. Breathe in through the nose and out through the mouth. The pump piston is forced down by this geared handle, sending the used air out of the shell through this sixteenth-inch hole. A ball check valve keeps the water from squirting in when the exhaust pressure is released."

He pointed to a telegraphic key which completed a circuit from the batteries in the bottom of the ball to a thread of copper cast through the lid.

"That's your plaything, Martin. You are to raise or lower us by pressing that key. It controls the donkey engine electrically, so that we guide our own destinies though we are a mile beneath our power plant. Stanley works the pump. I direct the searchlight, write down notes, and, I sincerely hope, take snapshots of deep sea life."

For a moment my part of the labor seemed so easy as to be unfair. Merely to sit there and punch a little key at raising and lowering time! But as I thought it over it began to appear more difficult.

The *Rosa* could not anchor, of course, in a mile of water. We would drift helplessly. If we approached an undersea cliff I must raise us at once to prevent us being smashed against it. And if the cliff were too lofty to be cleared in time....

I mentioned this to the Professor.

"That would be unfortunate," he said, with his frosty smile. "Stanley assures us this glass is unbreakable. He means commercially unbreakable. What would happen to it if it were submitted to the strain of being flung against a rock pile—in addition to the enormous stress of the water pressure—I don't know. It's your job to see that we don't have to find out!"

It had been planned to test the sphere empty first to see how it stood the strain.

We drifted to a full stop over the center of Penguin Deep where we were to gamble our lives in a game with Neptune. Sea anchors were rigged to lessen our drift and the donkey engine was geared to the first cable drum.

There was an impressive row of these drums, each holding an interminable length of three-quarter-inch cable. The bulk of a mile of steel cable has to be seen to be believed!

The glass sphere was lifted from the hold, delicately for all its enormous weight, and swung over the rail preparatory to being lowered into the depths.

Not until that moment did I notice two things: that there was no fastening of any kind to keep the thick lid in place: and that the three-quarter-inch cable looked like a pack thread in comparison to the ponderous bulk it strained to support.

"We couldn't use a heavier cable," said the Professor, "because of the strain. We're overloading the hoist as it is. As for the lid being fastened down—I think you'll

find it will be pressed into place securely enough!"

There was unanimous silence as the great globe slipped into the sea—down and down until the last reflection of the morning sun ceased to shimmer from its surface. Drum after drum was played out, till the first mate held his hand up to check the engineer.

"Five thousand feet, sir," he called to Stanley.

"Haul it back up. And let us hope," Stanley added fervently, "that we'll find the gadget in one piece."

The engine began to snort rhythmically. Dripping, vibrating, the coils of cable began to crawl back in place on the drums. There was a glint under the surface again as the sunlight reflected on the nearing sphere.

The great ball flashed out of the water, and a cheer burst from the throats of all of us. It was absolutely unharmed. Only—there was a beading of fine moisture inside the thick globe. What that could mean, none of us could figure out.

"Difference in temperature?" worried the Professor. "No, it's as cold inside as out. Molecules of water driven by sheer pressure through five feet of glass to unite in drops on the inside? Possibly. Well, there's one way to find out. Stanley, Martin—are you ready?"

We nodded, and prepared to visit the bottom a mile below the *Rosa's* keel. The preparation consisted merely in donning heavy, fleece-lined jumpers to protect us from the cold of the sunless depths.

Soberly we entered the ball to undergo whatever ordeal awaited us on the distant ocean floor. How comparative distance is! A mile walk in the country—it is nothing. A mile ascent in an airplane—a trifle. But a mile descent into pitch black, bone chilling depths of water—that is an immense distance!

Copper wire, on a separate drum, was connected from the engine switch to the copper thread that curled through the glass wall to my telegraphic key. We strapped the mouthpieces of the breathing tubes over our heads, and Browne started the slow turning of the compression pump.

The Professor snapped the searchlight on and off several times to see that it was in working shape. He raised his hand, I pressed the key, and the long descent began.

That plunge into the bottomless depths remains in my memory almost as clearly as the far more fantastic adventures that came to us later.

Smoothly, rapidly, the yellow-green of the surface water dimmed to olive. This in turn grew blacker and blacker. Then we were slipping down into pitch darkness—a big bubble lit by a meagre lamp and containing three fragile human beings that dared to trust the soft pulp of their bodies to the crushing weight of the deepest ocean.

The most impressive thing was the utter soundlessness of our descent. At first there had been a pulsing throb of the donkey engine transmitted to us by the sustaining cable. This died as we slid farther from the Rosa. At length it was hushed entirely, cushioned by the springy length of steel. There was no stir, no sound of any kind. As far as our senses

could tell us, we were hanging motionless in the pressing, awesome blackness.

The Professor switched off our light and turned on the searchlight which he trained downward through the wall at as steep an angle as the flooring would permit. Even then the illusion of motionlessness was preserved. There was nothing in the water to mark our progress. We might have been floating in a back void of space.

Down and down we went, for an interminable length of time—till at length we reached the abysmal level where the sun never shone and the eyes of man had never gazed till now.

Words were made to describe familiar articles. I find now when I am faced with the necessity of portraying events and objects beyond the range of normal human experience that I cannot conjure up words to fit. I despair of trying to make you see what we saw, and feel what we felt.

But try to picture yourself in the glass ball with us:

All is profound blackness save for a streak of white, dying about fifty feet away, which is the beam of our searchlight. Twenty feet below is a bare floor of flinty lava and broken shell. This is unrelieved by sea-weed of any kind, appearing like an imagined fragment of Martian or lunar landscape.

The ball sways idly to the push of some explicable submarine current. It is like being in a captive balloon, except that the connecting cable extends stiffly upward instead of downward.

There is a realization, an instinctive *feel* of awful pressure around you. Logic tells you how you are clamped about, but deeper than logic is the intuition that the glass walls are pressing in on themselves—at the point of collapse. Your ears, tingle with the feel of it: your head rings with it.

You are breathing in through your nose—thin, unsatisfying gulps of air that cause your lungs to labor at their task; and you are exhaling through, your mouth, with difficulty, into the barrel of the powerful pump. No bubbles arise from the tiny hole

where the used air is forced into the water. The pressure is too enormous for that. Only a thin, milky line marks its escape from the sphere.

In a ghostly way you see Stanley turning the pump handle. With a handful of waste which he has borrowed from the *Rosa's* engine room, the Professor wipes from the section of wall through which the searchlight plays the moisture that constantly collects there. I sit with my hand near the key, peering downward and ahead like an engineer in a locomotive cab, ready to raise the shell or lower it as occasion warrants.

And always the suffocating awareness of pressure....

Strange and mystic journey as the tortured glass sphere floated over the bottom, following the slow drift of the *Rosa* far above!

The finger of light played along the tilted side of a wrecked tramp steamer. There was a crumpled gash in the bow. From this ragged hole suddenly appeared a great, serpentine form....

The Professor clutched at his camera, pointed it, and clenched his hands in a frenzy of disappointment. The serpent shape had disappeared back into the hull. A little later and we had drifted slowly past the wreck.

"Damn it!" the Professor snatched away his mouthpiece to exclaim: "If we could only *stop*."

The bottom changed character shortly after we had passed the hulk. We began to creep over low, gently rounded mounds.

These were so regular in form that they were puzzling. About fifty feet across and ten in altitude, they looked artificial in their symmetry—like great saucers set on the ocean floor bottom side up. They took on a dirty black hue as our light struck them, and glowed with a faint phosphorescence as they stretched away into the darkness.

A twelve-foot monstrosity, all toad-like head and eyes, swam into the light beam and bumped blindly against the glass ball. For an instant it goggled crazily at us. The Professor took its picture. It blundered away. As

it reached the darkness beyond the beam it, too, showed phosphorescent. A belt of blue-white spots like the portholes of a liner extended down its ugly sides.

Along the bottom, between the curious mounds, writhed a wormlike thing. But it was too huge to be described as truly wormlike—it was eighteen or twenty feet long and a foot thick. It was blood red, almost blunt ended and patently without eyes.

I took my gaze off it for an instant. When I looked again it had disappeared. I blinked at this seeming miracle and then discovered a foot or so of its tail protruding from under the edge of one of the mounds. It was threshing furiously about.

It was at this instant that I suddenly found increased difficulty, and glanced at Stanley.

He had stopped pumping and was clutching at the Professor's arm with one hand while he pointed down with the other. The Professor motioned him toward the pump, and began to click pictures furiously with

the camera pointed at the nearest mound.

Wondering at the urgency of Stanley's gesture and the frantic clicking of the camera shutter, I looked more closely at the curious, saucerlike hump.

Under closer inspection something remarkably like a huge, mud-colored eye was revealed! And as we drifted along, twenty feet away on the farther slope, another appeared!

Paralyzed, I stared at the edges of the thing. They were waving almost imperceptibly up and down, *creeping!*

The mounds were living creatures! Acres and acres of them lying lethargically on the bottom waiting for something to crawl within range of their monstrous edges!

Involuntarily I pressed the key to raise us. But we had gone only a few feet when the Professor called to me.

"Down again, Martin. I don't think these things will

bother us unless we scrape against them. Anyway they can't hurt the shell."

I lowered the ball to our former twenty-foot level, and there we swung just over the monsters' backs.

The Professor had said that the giant inverted saucers would probably not bother us if we did not come in contact with them. It soon became apparent that, in a measure, he was right. The creatures either could not or would not lift their enormous bulks from the sea floor.

A gigantic wriggling thing, all grotesque fringe and tentacles, drifted down into the range of our light. Lower it floated until it hovered just above one of the larger mounds. The Professor got its portrait. At the same instant, as though it had heard the click of the shutter and been frightened by it, the thing dropped another foot—and touched the sloping back.

With the speed of light the inverted saucer became a

cup. Like a clenching fist, the cup closed over one of the straggling tentacles.

There followed a tug of war that was all the more ghastly for its soundlessness. The hunted jerked spasmodically to get away from the hunter. So wild were its efforts that several times it raised the monster clear of the bottom for a foot or so. But the grim clutch could not be broken.

Closer and closer it was dragged. Then, after a supreme paroxysm, the tentacle parted and the prey escaped. The tentacle disappeared into the mass of the baffled hunter. It made no attempt to follow the fleeing creature. It slowly relaxed along the bottom and waited for its next meal.

The unearthly incident gave us fresh confidence, convincing us that the monsters did not move unless they were directly touched. Of course we could not foresee the fatal accident that was going to put us within reach of one of the giant saucers.

We thought for awhile that these great blobs of cold

life were the largest creatures of the depths. It was soon made clear to us how mistaken that notion was!

For a time we gazed spellbound at the nightmare assortment of grotesqueries that gradually assembled around us, attracted no doubt by our light. The things were mainly sightless and of indescribable shape. Most of them were phosphorescent, and they avoided collisions in a way that suggested that they had some buried sense of light perception.

As time passed the Professor emptied his camera, refilled it several times and groaned that he had no more film. Twice as we drifted along I raised us to keep us clear of a gradual upward slope of the smooth floor.

Stanley removed his mouthpiece long enough to suggest that we go back to the surface: we had been submerged for nearly four hours now. But before we could reply a violent movement was felt.

The ball rocked and twirled so that we were forced to cling to the circular bench to avoid being thrown to

the floor. It was as though a hurricane of wind had suddenly penetrated the unruffled depths.

"Earthquake?" called Stanley.

"Don't know," answered the Professor. He swung the searchlight in an arc and focussed it at length on something that appeared only as a field of blurred movement. He wiped the moisture from the wall before the lens, and there was revealed to us a sight that makes my heart pound even now when I recall it to memory.

Something vast and serpentine had ventured too near the bottom—and had been caught by the death traps there!

The creature was a writhing mass of gigantic coils. It was impossible even to guess at its length, but its girth was such that the mound-shaped monsters that had fastened to it could not entirely encircle it.

There it twined and knotted: a mighty serpent of the deepest ocean, snapping its awful length and

threshing its powerful tail in an effort to dislodge the giant leeches that were flattened against it. And every time it touched the bottom in its blind frenzy, more of the teeming deathtraps attached themselves to it, crawling over their fellows in an effort to find unoccupied areas.

Soon the sea-serpent was a distorted, creeping mass. For one appalling instant its head came into our view....

It resembled the head of a crocodile, only it was ten times larger and covered with scale like the armor plate of a destroyer. The jaws, wide open and slashing with enormous, needle-shaped teeth at the huge parasites, were large enough to have held our glass sphere. One eye appeared. It was at least three feet across and of a shimmering amethyst color.

One of the deadly saucers wrapped itself around the great head. The entire mass of attackers and attacked settled slowly to the bottom.

But before it completely succumbed the beaten

monster gave one last, convulsive flick of its tail....

"Good God!" cried Stanley, shrinking away from the pump and staring upward.

I followed his gaze with my own eyes.

In the faint reflected glow of the searchlight I could see row on row of large cups flattened against the top of the ball. As I watched these flattened still more and the big sphere quivered perceptibly.

In its death struggle the mighty serpent had flicked one of the huge leeches against us. It now clung there with blind tenacity, covering nearly two-thirds of our shell with the underside of its body.

I reached for the control key to send us to the surface.

"Don't!" snapped the Professor. "The weight—"

He needed to say no more. My hand recoiled as though the key had been red hot.

The three-quarter-inch cable above us was now sustaining, in addition to its own huge weight, our massive glass ball and the appalling tonnage of this grim blanket of flesh that encircled us. Could it further hold against the strain of lifting that combined tonnage through the press of the water? Almost certainly it could not!

There was nothing we could do but hang there and discover at first hand exactly what happened to things that were clamped in those mighty, living vises!

The Professor turned on the interior bulb. The result was ghastly. It showed every detail of the belly of the thing that gripped us.

Crowded over its entire under surface were gristly, flattened suckers. Now and then a convulsive ripple ran through its surface tissue and great ridges of flesh stood out. With each squeeze the glass shell quivered ominously as though the extreme limit of its pressure resisting power were being reached—and passed.

"A nice fix," remarked the Professor, his calm, dry voice acting like a tonic in that moment of fear. "If we try to go up, the cable would probably break. If we try to outlast the patience of this thing we might run out of air, or actually be staved in."

He paused thoughtfully.

"I suggest, though, that we follow the latter course for awhile at least. It would be just too bad if that cable broke, gentlemen!"

Stanley shuddered, and looked at the dirty white belly that pressed against the glass walls on all sides.

"I vote we stay here for a time."

"And I," was my addition.

I relieved Stanley at the pump. He and the Professor sat down on the bench. Casting frequent glances at the constricted blanket of flesh that covered us, we prepared to wait as composedly as we might for the thing to give up its effort to smash our shell.

The hour that followed was longer than any full day I have ever lived through. Had I not confirmed the passage of time by looking at my watch, I would have sworn that at least twenty hours had passed.

Every half-minute I gazed at that weaving pattern of cup-shaped suckers only five feet away, trying to see if they were relaxing in their pressure. I attempted to persuade myself that they were. But I knew I was only imagining it. Actually they were pressed as flat as ever, and the sphere still quivered at regular intervals as the heavy body squeezed in on itself. There was no sign that its blind, mindless patience was becoming exhausted.

There was little conversation during that interminable hour.

Stanley grinned wryly once and commented on the creature's disappointment if it actually succeeded in getting at us.

"We'd be scattered all over the surrounding half mile by the pressure of the water," he said. "There'd be

nothing left for our pet to feed on but five-foot chunks of broken glass. Not a very satisfying meal."

"We might try to reason with the thing—point out how foolish it is to waste its time on us," I suggested, trying to appear as nonchalant as he was.

The Professor said nothing. He was coolly writing in his notebook, describing minutely the appearance of our abysmal captor.

Finally I chanced to look down through a section of wall not covered by our stubborn enemy. I wiped the moisture from the glass before the searchlight so that I could see more clearly.

The bottom seemed to be heaving up and down. I blinked my eyes and looked again. It was not an illusion. With a regular dip and rise we were approaching to within a few feet of the rocky floor and moving back up again. Also we were floating faster than at anytime previous. The bottom was bare again; we had left the crowding, ominous mounds.

I waved to the Professor. He snapped his notebook shut and stared at the uneasy ocean bottom.

"I've been hoping I was wrong," he said simply. "I thought I felt a wavy motion fifteen minutes ago, and it seemed to me to increase steadily."

The three of us stared at each other.

"You mean ..." began Stanley with a shudder.

"I mean that the *Rosa*, one mile above us, is having difficulties. A storm. Judging from our movement it must be a hurricane: the length of cable would cushion us from any average wave, and we are rising and falling at least fifteen feet."

"My God!" groaned Stanley. "The *Rosa* is already heeled with the weight of us. She could never weather a hurricane!"

The plight of the crew above our heads was as clear to us as though we had been aboard with them.

Should they cut the cable, figuring that the lives of the three of us were certainly not to be set against the thirty on the yacht?

Should they disconnect the electric control and try to haul us up regardless?

Or should they try to ride out the storm in spite of being crippled by the drag of us?

"I think if I were up there I'd cut us adrift," said Stanley grimly. Both the Professor and myself nodded. "Though," he added hopefully, "my captain is a good gambler...."

The cable quivered like a live thing under the terrific strain. At each downward swoop, before the upswing began, there was a sickening sag.

"We no longer have a decision to make," said the Professor. "Press the key, Martin, and God grant we can rise with all this dead weight."

And at that instant the crew of the *Rosa* were also

relieved of the necessity for making a decision.

At the bottom of one of those long, sickening falls there was a jerk—and we continued on down to the ocean floor!

The sphere rolled over, jumbling the equipment in a tangled mess with the three of us in the center, bruised and cut. The light snapped off as the battery connections were torn loose.

There we lay at the bottom of Penguin Deep, in an inert sphere that was dead and dark in the surrounding blackness—a coffin of glass to hold us through the centuries....

"Martin," I heard the Professor's voice after a time. "Stanley—can either of you move? I'm caught."

"I'm caught, too," came Stanley's gasping answer. "Something on my leg—feels like it's broken."

A heavy object was pressing across my body. With an effort I freed myself and fumbled in the pitch

darkness for the other two.

"Lights first," commanded the Professor. "The pump, you know."

I did know! Frantically I scrambled in the dark till I located the batteries. They were right side up and still wired together.

The air grew rapidly foul with no one at the pump. Panting for breath I blundered at the task of connecting the light. After what seemed an eternity I accomplished it.

The light revealed Stanley with an air tank lying across his leg. The mouthpiece of his breathing tube had been forced back over his head, gashing his face in its journey. His face was white with pain.

The Professor was caught under the heavy bench. I freed him and together we attended to Stanley, finding that his leg wasn't broken but only badly bruised.

The mound-shaped monster, dislodged possibly by the fall, was nowhere to be seen.

I resumed work at the pump, the connections of which were so strongly contrived that they had withstood the shock of the upset.

For a moment we were content to rest while the air grew purer. Then we were forced squarely to face our fate.

The Professor summed up the facts in a few concise words.

"We're certainly doomed! Here at the bottom of Penguin Deep we're as out of reach of help as though we were stranded on the moon. We're as good as dead right now."

"If we have nothing left to hope for," whispered Stanley after a time, "we might as well close the air valves and get it over with at once. No use torturing

ourselves...."

The Professor moistened his lips.

"It might be wise." He turned to me. "What's your opinion, Martin?"

But I—I confess I had not the stark courage of these two.

"No! No!" I cried out. "Let's keep on living as long as the air holds out. Something might happen—"

I avoided their eyes as I said it, utterly ashamed of my cowardly quibbling with death. What in the name of God could possibly happen to help us?

The Professor shrugged dully, and nodded.

"I feel with Stanley that we ought to get it over in one short stab. But we have no right to force you...." His voice trailed off.

We readjusted our mouthpieces. I turned

automatically at the pump; and we silently awaited the last suffocating moment of our final doom.

As before, attracted by the light, a strange assortment of deep-sea life wriggled and darted about us, swimming lazily among the looped coils and twists of our cable which had settled down around us.

Among these were certain fish that resembled great porcupines. Spines a foot and a half long, like living knife blades, protected them from the attacks of other species.

They were the only things we saw that were not constantly writhing away from the jaws of some hostile monster—the only things that seemed able to swim about their own affairs without even deigning to watch for danger.

Fascinated, I watched the six-foot creatures. Here were we, reasoning humans, supposed lords of creation, slowly but surely perishing—while only a

few feet away one of the lowest forms of life could exist in perfect safety and tranquility!

Then, as I watched them, I seemed to see a difference in some of them.

The majority of them had two fins just behind the gill slits, typical fish tails and blunt, sloping heads. But now and then I saw a spined monster that was queerly unlike its fellows.

Instead of two front fins, these unique ones had two vacant round holes. The head looked as though it had forgotten to grow; its place was taken by an eyeless, projecting, shield shaped cap. And there was no tail.

Glad to find something to distract my half crazed thoughts, I studied the nearest of these.

They moved slower than their tailed and finned brothers, I noticed. I wondered how they could move at all, lacking in any kind of motive power as they seemed to be.

Next instant the secret of their movement was made clear!

Out of the empty fin holes of the creature I was studying crept two long, powerful looking tentacles. But these were not true tentacles. There were no vacuum discs on them, and they moved as though supported by jointed bones—like arms.

The arms ended in flat paddles that resembled hands. These threshed the water in a sort of breast-stroke, propelling the body forward.

Shortly after the arms had appeared, the spiny head cap was cautiously extended a few inches forward from the main shell. Further it was extended as the head of a turtle might slowly appear from the protection of its bony case. And under it—

"Professor!" I screamed wildly. "My God! Look!"

Both the Professor and Stanley merely stared dully at me. I babbled of what I had seen.

"A man! A human looking thing, anyway! Arms and a head! A man inside a fish's spined hide—like armor!"

They looked pityingly at me. The Professor laid his hand on my shoulder.

"Now, now," he soothed, "don't go to pieces—"

"I tell you I saw it!" I shouted. Then, shrinking from the hysterical loudness of my own voice, I lowered my tone. "Something that looks human has occupied some of those prickly, six-foot shells. I saw arms—and a man's head! I swear it!"

"Nonsense! How could a human being stand the cold, the pressure—"

Here I happened to glance at the wall of the shell through which the searchlight shone.

"Look! See for yourself!"

Squarely in the rays of the light showed a head, projecting from one of the shells and capped with a

wide flat helmet of horned bone.

There were eyes and nose and mouth placed on one side of that head—a face! There were even tabs of flesh or bony protuberances that resembled ears.

"Curious," muttered the Professor, staring. "It certainly looks human enough to talk. But it's only a fish, nevertheless. See—in the throat are gill slits."

"But the eyes! Look at them! They're not the eyes of a fish!"

And they were not. There was in them a light of reason, of intelligence. Those eyes were roaming brightly over us, observing the light, the equipment, seeming to note our amazement as we crowded to look at it.

The sphere rocked slightly. Behind the staring, manlike visitor there was a glimpse of enormous, crocodile jaws and huge, amethyst eyes. Instantly the head and arms receded, leaving an empty-seeming, lifeless shell. An impregnable fortress of spines, the

thing drifted slowly away through the twisted loops of cable.

"It certainly looked like—" began Stanley shakily.

"The creature was just a fish," said the Professor shaking his head at the light in Stanley's eyes. "Some sort of giant parasite that inhabits the shells of other fish."

He opened the valve of the last air cylinder and seated himself resignedly on the bench.

"We have another half hour or so—"

All of us suddenly put out our hands to brace ourselves. The sphere had moved.

"Look at the cable!" called Stanley.

We did so. It was moving, writhing away from us over the bottom as though abruptly given life of its own. Coil after coil disappeared into the further gloom.

At length the cable was straight. The ball moved again—was dragged a few feet along the rocky floor.

Something—possessed of incredibly vast power—had seized the end of the steel cable and was reeling us in as a fisherman reels in a trout!

Slowly, unsteadily, we slid along the ocean floor. Ahead of us appeared a jagged black wall—a cliff. There was a gloomy hole at its base. Toward this we were being dragged by whatever it was that had caught the end of the cable.

Helpless, we watched ourselves engulfed by the murky den. In the beam of the searchlight we saw that the submarine cavern extended on and on for an unguessable depth. The cable, taut with the strain, stretched ahead out of sight.

Time had been lost track of during that mysterious, ominous journey. It was recalled to us by the state of the air we were breathing.

The Professor removed his mouthpiece and cast the

tube aside.

"You might as well stop pumping, Martin," he said quietly. "We're done. There's no more air in the flask."

We stared at each other. Then we shook hands, solemnly, tremulously, taking leave of each other before we departed on that longest of all journeys....

The air in that small space was rapidly exhausted. We lay on the floor, laboring for breath, and closed our eyes....

The Professor, the oldest of the three of us, succumbed first. I heard his breath whistle stertorously and, glancing at him, saw that he was in a coma. In a moment Stanley had joined him in blessed unconsciousness.

I could feel myself drifting off.... Hammers beat at my ears.... Daggers pierced my heaving lungs....

Hazily I could see scores of the bristly, manlike fish when I opened my eyes and glanced through the

walls. It was not one monster then, but many that had brought us to their lair. Abruptly, as though a signal had been given, they all streamed back toward the mouth of the cavern....

My eyesight dimmed.... The hammers pulsed louder.... A veil descended over my senses and I knew no more....

A soft, sustained roar came to my ears. Through my closed eyelids I could sense light. A dank, fishy smell came to my nostrils.

I groaned and moved feebly, finding that I was resting on something soft and pleasant.

Dazedly I opened my eyes and sat up. An exclamation burst from me as I suddenly remembered what had gone before, and realized that somehow, incredibly, I was still living.

Feeling like a man who has waked from a nightmarish sleep to find himself in his tomb, I gazed about.

I was in a long, lofty rock chamber, the uneven floor of which was covered with shallow pools of water. The further end was of smooth-grained stone that resembled cement. The near end was rough like the walls; but in it there was a small, symmetrical arch, the mouth of a passage leading away to some other point in the bowels of the earth.

The place was flooded with clear light that had a rosy tinge. From my position on the floor I could not see what made the light. It streamed from a crevice that extended clear around the cave parallel with the floor and about twelve feet above it. From this groove, along with the light, came the soft roaring hiss.

Beside me was the glass ball, the cover off and lying a few feet away from the opening in the top. There was no trace of Stanley or the Professor.

I rose from my couch, a thick, mattresslike affair of soft, pliant hide, and walked feebly toward the small arch in the near end of the cave.

Even as I approached it I heard footsteps, and voices

resounded in some slurring, musical language. Half a dozen figures suddenly came into view.

They were men, as human as myself! Indeed, as I gazed at them, I felt inclined to think they were even more human!

They were magnificent specimens. The smallest could not have been less than six feet three, and all of them were muscular and finely proportioned. Their faces were arresting in their expression of calm strength and kindliness. They looked like gods, arrayed in soft, thick, beautifully tanned hides in this rosy tinted hole a mile below the ocean's top.

They stared at me for an instant, then advanced toward me. My face must have reflected alarm, for the tallest of them held up his hand, palm outward, in a peaceful gesture.

The leader spoke to me. Of course the slurred, melodious syllable meant nothing to me. He smiled and indicated that I was to follow him. I did so, hardly aware of what I was doing, my brain reeling in an

attempt to grasp the situation.

How marvelous, how utterly incredible, to find human beings here! How many were there? Where had they come from? How had they salvaged us from Penguin Deep? I gave it up, striding along with my towering guards like a man walking in his sleep.

At length the low passageway ended, and I exclaimed aloud at what I saw.

I was looking down a long avenue of buildings, all three stories in height. There were large door and window apertures, but no doors nor window panes. In front of each house was a small square with—wonder of wonders!—a lawn of whitish yellow vegetation that resembled grass. In some of the lawns were set artistic fountains of carved rock.

I might have been looking down any prosperous earthly subdivision, save for the fact that the roofs of the houses were the earth itself, which the building walls, in addition to functioning as partitions, served to support. Also earthly subdivisions aren't usually

illuminated with rosy light that comes softly roaring from jets set in the walls.

We were walking toward a more brightly lighted area that showed ahead of us. On the way we passed intersections where other, similar streets branched geometrically away to right and left. These were smaller than the one we were on, indicating that ours was Main Street in this bizarre submarine city.

Faces appeared at door and window openings to peer at me as we passed. And even in that jumbled moment I had time to realize that these folk could restrain curiosity better than we can atop the earth. There was no hub-bub, no running out to tag after the queerly dressed foreigner and shout humorous remarks at him.

We approached the bright spot I had noticed from afar. It was an open square, about a city block in area, in the center of which was a royal looking building covered with blazing fragments of crystal and so

brilliantly resplendent with light that it seemed to glow at the heart of a pink fire.

I was led toward this and in through a wide doorway. As courteously as though I were a visiting king, I was conducted up a great staircase, down a corridor set with more of the sparkling crystals and into a huge, low room. There my escort bowed and left me.

Still feeling that I could not possibly be awake and seeing actual things, I glanced around.

In a corner was another of the mattresslike couches made of the thick, soft hide that seemed to be the principal fabric of the place. A few feet away was a table set with dishes of food in barbaric profusion. None of the viands looked familiar but all appealed to the appetite. The floor was strewn with soft skins, and comfortable, carved benches were scattered about.

I walked to the window and looked out. Underneath was a plot of the cream colored grass through which ran a tiny stream. This widened at intervals into clear pools beside which were set stone benches. A

hundred yards away was the edge of the square, where the regular, three storied houses began.

While I was staring at this unearthly vista, still unable to think with any coherence. I heard my name called. I turned to face Stanley and the Professor.

Both were pale in the rose light, and Stanley limped with the pain of his bruised leg: but both had recovered from their partial suffocation as completely as had I.

"We thought perhaps you'd decided to swim back up to the *Rosa* and leave us to our fates," said Stanley after we had stopped pumping each other's arms and had seated ourselves.

"And I thought—well, I didn't think much of anything," I replied. "I was too busy straining my eyesight over the wonders of this city. Did you ever see anything like it?"

"We haven't seen it at all, save for a view from the windows," said Stanley. "All we know of the place is that a while ago we woke up in a room like this, only much smaller and less lavish. I wonder why you rate this distinction?"

I described the streets as I had seen them. (It is impossible for me to think of them as anything but streets; it would seem as though the rock roof over all would give the appearance of a series of tunnels; but I had always the impression of airiness and openness.)

"Light and heat are furnished by natural gas," said the Professor when I remarked on the perfection of these two necessities. "That's what makes the low roaring noise—the thousands of burning jets. But the presence of gas here isn't as unusual as the presence of air. Where does that come from? Through wandering underground mazes, from some cave mouth in the Fiji Islands to the north? That would indicate that all the earth around here is honeycombed like a gigantic section of sponge. I wonder—"

"Have you any idea how we were rescued?" I interrupted, a little impatient of his abstract scientific ponderings.

"We have," said Stanley. "A woman told us. We woke up to find her nursing us—gorgeous looking thing—finest woman I've ever seen, and I've seen a good many—"

"She didn't exactly 'tell' us," remarked the Professor with his thin smile. Women were only interesting to him as biological studies. "She drew a diagram that explained it.

"That tunnel, Martin, was like the outer diving chamber of a submarine. We were hauled in on a big windlass—driven by gas turbines, I think. Once we were inside, a twenty-yard, counterbalanced wall of rock was lowered across the entrance. Then the water was drained out through a well, and into a subterranean body of water that extends under the entire city. And here we are."

We fell silent. Here we were. But what was going to

happen to us among these friendly-seeming people; and how—if ever—we were going to get back to the earth's surface, were questions we could not even try to answer.

We ate of the appetizing food laid out on the long table. Shortly afterward we heard steps in the corridor outside the room.

A woman entered. She was ravishingly beautiful, tall, slender but symmetrically rounded. A soft leather robe slanted upward across her breast to a single shoulder fastening and ended just above her knees in a skirt arrangement. Around her head was a regal circlet of silvery gray metal with a flashing bit of crystal set in the center above her broad, low forehead.

She smiled at Stanley who looked dazzled and smiled eagerly back.

She pointed toward the door, signifying that we were to go with her. We did so; and were led down the great staircase and to a huge room that took up half

the ground floor of the building. And here we met the nobility of the little kingdom—the upper class that governed the immaculate little city.

They were standing along the walls, leaving a lane down the center of the room—tall, finely modelled men and women dressed in the single garments of soft leather. There were people there with gray hair and wisdom wrinkled faces; but all were alike in being erect of body, firm of bearing and in splendid health.

They stopped talking as we entered the big room. Our gaze strayed ahead down the lane toward the further wall.

Here was a raised dais. On it was a gleaming crystal encrusted throne. And occupying it was the most queenly, exquisitely beautiful woman I had ever dreamed about.

Woman? She was just a girl in years in spite of her grave and royal air. Her eyes were deep violet. Her hair was black as ebony and gleaming with sudden

glints of light. Her skin—

But she cannot be described. Only a great painter could give a hint of her glory. Too, I might truthfully be described as prejudiced about her perfections.

The Queen, for patently she was that, bowed graciously at us. It seemed to me—though I told myself that I was an imaginative fool—that her eyes rested longest on me, and had in them an expression not granted to the Professor or Stanley.

She spoke to us a melodious sentence or two, and waved her beautiful hand in which was a short ivory wand, evidently a scepter.

"She's probably giving us the keys to the city," whispered Stanley. He edged nearer the fair one who had conducted us. "I sincerely hope there's room here for us."

The open lane closed in on us. Men and women crowded about us speaking to us and smiling ruefully as they realized we could not understand. I noticed

that, for some curious reason, they seemed fascinated by the color of my hair. Red-haired men were evidently scarce there.

At length the beauty who had so captured Stanley's fancy, and who seemed to have been appointed a sort of mentor for us, suggested in sign language that we might want to return to our quarters.

It was a welcome suggestion. We were done in by the experiences and emotions that had gripped us since leaving the *Rosa* such an incredibly few hours ago.

We went back to the second floor. I to my luxurious big apartment and Stanley and the Professor to their smaller but equally comfortable rooms.

A pleasant period slid by, every waking hour of which was filled with new experiences.

The city's name, we found, was Zyobor. It was a perfect little community. There were artisans and thinkers, artists and laborers—all alike in being physically perfect beyond belief and cultured as no

race on top the ground is cultured.

As we began to learn the language, more exact details of the practical methods of existence were revealed to us.

The surrounding earth furnished them with building materials, metals and unlimited gas. The sea, so near us and yet so securely walled away, gave them food. Which warrants a more detailed description.

We were informed that the manlike, two-armed fishes were the servants of these people—domesticated animals, in a sense, only of an extremely high order of intelligence. They were directed by mental telepathy (Every man, woman and child in Zyobor was skilled at thought projection. They conversed constantly, from end to end of the city, by mental telepathy.)

Protected in their spined shells, which they captured from the schools of porcupine fish that swarmed in Penguin Deep, they gathered sea vegetation from the higher levels and trapped sea creatures. These were brought into the subterranean chamber where our

glass ball now reposed. Then the chamber was emptied of water and the food was borne to the city.

The vast army of mound-fish provided the bulk of the population's food, and also furnished the thick, pliant skin they used for clothing and drapes. They were cultivated as we cultivate cattle—an ominous herd, to be handled with care and approached by the fish-servants with due caution.

Thus, with all reasonable wants satisfied, with talent and brains to design beautiful surroundings, lighted and warmed by inexhaustible natural gas, these fortunate beings lived their sheltered lives in their rosy underground world.

At least I thought their lives were sheltered then. It was only later, when talking to the beautiful young Queen, that I learned of the dread menace that had begun to draw near to them just a short time before we were rescued....

My first impression, when we had entered the throne room that first day, that the Queen had regarded me

more intently than she had Stanley or the Professor, had been right. It pleased her to treat me as an equal, and to give me more of her time than was granted to any other person in the city.

Every day, for a growing number of hours, we were together in her apartment. She personally instructed me in the language, and such was my desire to talk to this radiant being that I made an apt pupil.

Soon I had progressed enough to converse with her—in a stilted, incorrect way—on all but the most abstract of subjects. It was a fine language. I liked it, as I liked everything else about Zyobor. The upper earth seemed far away and well forgotten.

Her name, I found, was Aga. A beautiful name....

"How did your kingdom begin?" I asked her one day, while we were sitting beside one of the small pools in the gardens. We were close together. Now and then my shoulder touched hers, and she did not draw away.

"I know not," she replied. "It is older than any of our

ancient records can say. I am the three hundred and eleventh of the present reigning line."

"And we are the first to enter thy realm from the upper world?"

"Thou art the first."

"There is no other entrance but the sea-way into which we were drawn?"

"There is no other entrance."

I was silent, trying to realize the finality of my residence here.

At the moment I didn't care much if I never got home!

"In the monarchies we know above," I said finally, avoiding her violet eyes, "it is not the custom for the queen—or king—to reign alone. A consort is chosen. Is it not so here? Has thou not, among thy nobles, some one thou hast destined—"

I stopped, feeling that if she dismissed me in anger and never spoke to me again the punishment would be just.

But she wasn't angry. A lovely tide of color stained her cheeks. Her lips parted, and she turned her head. For a long time she said nothing. Then she faced me, with a light in her eyes that sent the blood racing in my veins.

"I have not yet chosen," she murmured. "Mayhap soon I shall tell thee why."

She rose and hurried back toward the palace. But at the door she paused—and smiled at me in a way that had nothing whatever to do with queenship.

As the time sped by the three of us settled into the routine of the city as though we had never known of anything else.

The Professor spent most of his time down by the sea chamber where the food was dragged in by the intelligent servant-fish.

He was in a zoologist's paradise. Not a creature that came in there had ever been catalogued before. He wrote reams of notes on the parchment paper used by the citizens in recording their transactions. Particularly was he interested in the vast, lowly mound-fish.

One time, when I happened to be with him, the receding waters of the chamber disclosed the body of one of the odd herdsmen of these deep sea flocks. Then the Professor's elation knew no bounds. We hurried forward to look at it.

"It is a typical fish," puzzled the Professor when we had cut the body out of its usurped armor. "Cold blooded, adapted to the chill and pressure of the deeps. There are the gills I observed before ... yet it looks very human."

It surely did. There were the jointed arms, and the rudimentary hands. Its forehead was domed; and the brain, when dissected, proved much larger than the brain of a true fish. Also its bones were not those of a mammal, but the cartilagenous bones of a fish. It was

not quite six feet long; just fitted the horny shell.

"But its intelligence!" fretted the Professor, glorying in his inability to classify this marvelous specimen.

"No fish could ever attain such mental development. Evolution working backward from human to reptile and then fish—or a new freak of evolution whereby a fish on a short cut toward becoming human?" He sighed and gave it up. But more reams of notes were written.

"Why do you take them?" I asked. "No one but yourself will ever see them."

He looked at me with professorial absent-mindedness.

"I take them for the fun of it, principally. But perhaps, sometime, we may figure out a way of getting them up. My God! Wouldn't my learned brother scientists be set in an uproar!"

He bent to his observations and dissections again, cursing now and then at the distortion suffered by the specimens when they were released from the deep

sea pressure and swelled and burst in the atmospheric pressure in the cave.

Stanley was engrossed in a different way. Since the moment he laid eyes on her, he had belonged to the stately woman who had first nursed him back to consciousness. Mayis was her name.

From shepherding the three of us around Zyobor and explaining its marvels to us, she had taken to exclusive tutorship of Stanley. And Stanley fairly ate it up.

"You, the notorious woman hater," I taunted him one time, "the wary bachelor—to fall at last. And for a woman of another world—almost of another planet! I'm amazed!"

"I don't know why you should be amazed," said he stiffly.

"You've been telling me ever since I was a kid that women were all useless, all alike—"

"I find I was mistaken," he interrupted. "They aren't all alike. There's only one Mayis. She is—different."

"What do you talk about all the time? You're with her constantly."

"I'm not with her any more than you're with the Queen," he shot back at me. "What do you find to talk about?"

That shut me up. He went to look for Mayis; and I wandered to the royal apartments in search of Aga.

In the first days of our friendship I had several times surprised in Aga's eyes a curious expression, one that seemed compounded of despair, horror and resignation.

I had seen that same expression in the eyes of the nobles of late, and in the faces of all the people I encountered in the streets—who, I mustn't forget to add here, never failed to treat me with a deference that was as intoxicating as it was inexplicable.

It was as though some terrible fate hovered over the populace, some dreadful doom about which nothing could be done. No one put into words any fears that might confirm that impression; but continually I got the idea that everybody there went about in a state of attempting to live normally and happily while life was still left—before some awful, wholesale death descended on them.

At last, from Aga, I learned the fateful reason.

But first—a confession that was hastened by the knowledge of the fate of the city—I learned from her something that changed all of life for me.

We were surrounded by the luxury of her private apartment. We sat on a low divan, side by side. I wanted, more than anything I had ever wanted before, to put my arms around her. But I dared not. One does not make love easily to a queen, the three hundred and eleventh of a proud line.

And then, as maids have done often in all countries, and, perhaps, on all planets, she took the initiative

herself.

"We have a curious custom in Zyobor of which I have not yet told thee," she murmured. "It concerns the kings of Zyobor. The color of their hair."

She glanced up at my own carrot-top, and then averted her gaze.

"For all of our history our kings have had—red hair. On the few occasions when the line has been reduced to a lone queen, as in my case, the red-haired men of the kingdom have striven together in public combat to determine which was most powerful and brave. The winner became the Queen's consort."

"And in this case?" I asked, my heart beginning to pound madly.

"In my case, my lord, there is to be no—no striving. When I was a child our only two red-haired males died, one by accident, one by sickness. Now there are none others but infants, none of eligible age. But—by a miracle—thou—"

She stopped; then gazed up at me from under long, gold flecked lashes.

"I was afraid ... I was doomed to die ... alone...."

It was after I had replied impetuously to this, that she told me of the terror that was about to engulf all life in the beautiful undersea city.

"Thou hast wonder, perhaps, why I should be forward enough to tell thee this instead of waiting for thine own confession first," she faltered. "Know, then—the reason is the shortness of the time we are fated to spend together. We shall belong each to the other only a little while. Then shall we belong to death! And I—when I knew the time was to be so brief—"

And I listened with growing horror to her account of the enemy that was advancing toward us with every passing moment.

About twenty miles away, in the lowest depression of

Penguin Deep, lived a race of monsters which the people of Aga's city called Quabos.

The Quabos were grim beings that were more intelligent than Aga's fish-servants—even, she thought, more intelligent than humans themselves. They had existed in their dark hole, as far as the Zyobites knew, from the beginning of time.

Through the countless centuries they had constructed for themselves a vast series of dens in the rock. There they had hidden away from the deep-sea dangers. They, too, preyed on the mound-fish; but as there was plenty of food for all, the Zyobites had never paid much attention to them.

But—just before we had appeared, there had come about a subterranean quake that changed the entire complexion of matters in Penguin Deep.

The earthquake wiped out the elaborately burrowed sea tunnels of the Quabos, killing half of them at a blow and driving the rest out into the unfriendly openness of the deep.

Now this was fatal to them. They were not used to physical self defense. During the thousands of years of residence in their sheltered burrows they had become utterly unable to exist when exposed to the primeval dangers of the sea. It was as though the civilization-softened citizens of New York should suddenly be set down in a howling wilderness with nothing but their bare hands with which to contrive all the necessities of a living.

Such was the situation at the time Stanley, the Professor and myself arrived in Zyobor.

The Quabos must find an immediate haven or perish. On the ocean bottom they were threatened by the mound-fish. In the higher levels they were in danger from almost everything that swam: few things were so defenceless as themselves after their long inertia.

Their answer was Zyobor. There, in perfect security, only to be reached by the diving chamber that could be sealed at will by the twenty-yard, counterbalanced lock, the Quabos would be even more protected than in their former runways.

So—they were working day and night to invade Aga's city!

"But Aga," I interrupted impulsively at this point. "If these monsters are fishes, how could they live here in air—"

I stopped as my objection answered itself before she could reply.

They would not have to live in air to inhabit Zyobor. They would inundate the city—flood that peaceful, beautiful place with the awful pressure of the lowest depths!

That thought, in turn, suggested to me that every building in Zyobor would be swept flat if subjected suddenly to the rush of the sea. The great low cavern, without the support of the myriad walls, would probably collapse—trapping the invading Quabos and leaving the rest without a home once more.

But Aga answered this before I could voice it.

The Quabos had foreseen that point. They were tunneling slowly but surely toward the city from a point about half a mile from the diving chamber. And as they advanced, they blocked up the passageway behind them at intervals, drilled down to the great underground sea that lay beneath all this section, and drained a little of the water away.

In this manner they lightened, bit by bit, the enormous weight of the ocean depths. When the city was finally reached, not only would it be ensured against sudden destruction but the Quabos themselves would have become accustomed to the difference in pressure. Had they gone immediately from the accustomed press of Penguin Deep into the atmosphere of Zyobor, they would have burst into bits. As it was they would be able to flood the city slowly, without injury to themselves.

"Now thou knowest our fate," concluded Aga with a shudder. "Zyobor will be a part of the great waters. We ourselves shall be food for these monsters...." She faltered and stopped.

"But this cannot be!" I exclaimed, clenching my fists impotently. "There *must* be something we can do; some way—"

"There is nothing to be done. Our wisest men have set themselves sleeplessly to the task of defence. There is no defence possible."

"We can't simply sit here and wait! Your people are wonderful, but this is no time for resignation. Send for my two friends, Aga. We will have a council of war, we four, and see if we can find a way!"

She shrugged despairfully, started to speak, then sent in quest of Stanley and the Professor.

They as well as myself, had had no idea of the menace that crept nearer us with each passing hour. They were dumbfounded, horrified to learn of the peril. We sat awhile in silence, realizing our situation to the full.

Then the Professor spoke:

"If only we could see what these things look like! It might help in planning to defeat them."

"That can be done with ease," said Aga. "Come."

We went with her to the gardens and approached the nearest pool.

"My fish-men are watching the Quabos constantly. They report to me by telepathy whenever I send my thoughts their way. I will let you see, on the pool, the things they are now seeing."

She stared intently at the sheet of water. And gradually, as we watched, a picture appeared—a picture that will never fade from my memory in any smallest detail.

The Quabos had huddled for protection into a large cave at the foot of the cliff outside Zyobor. There were a great many Quabos, and the cave was relatively confining. Now we saw, through the eyes of the spine protected outpost of the Queen, these monstrous refugees crowded together like sheep.

The watery cavern was a creeping mass of viscous tentacles, enormous staring eyes and globular heads. The cave was paved three deep with the horrible things, and they were attached to the its walls and roof in solid blocks.

"My God!" whispered Stanley. "There are thousands of them!"

There were. And that they were in distress was evident.

The layers on the floor were weaving and shifting constantly as the bottom creatures struggled feebly to rise to the top of the mass and be relieved of the weight of their brothers. Also they were famished....

One of the blood red, gigantic worms floated near the cave entrance. Like lightning the nearest Quabos darted after it. In a moment the prey was torn to bits by the ravenous monsters.

The other side of the story was immediately portrayed to us.

With the emerging of the reckless Quabos, a sea-serpent appeared from above and snapped up three of their number. Evidently the huge serpent considered them succulent tidbits, and made it its business to wait near the cave and avail itself of just such rash chance-taking as this.

While we watched the nightmare scene, a Quabo disengaged itself from the parent mass and floated upward into the clear, giving us a chance to see more distinctly what the creatures looked like.

There was a black, shiny head as large as a sugar barrel. In this were eyes the size of dinner plates, and gleaming with a cold, hellish intelligence. Four long, twining tentacles were attached directly to the head. Dotted along these were rudimentary sucker discs, that had evidently become atrophied by the soft living of thousands of the creature's ancestors.

As though emerging from the pool into which we were

gazing, the monster darted viciously at us. At once it disappeared: the fish-servant through whose eyes we were seeing all this had evidently retreated from the approach; although, protected by its spines, it could not have been in actual danger.

"How dost thou know of the tunneling?" I asked Aga. "Thy fish-men cannot be present there, in the rear of the tunnel, to report."

"My artisans have knowledge of each forward move," she answered. "I will show thee."

We walked back to the palace and descended to a smooth-lined vault. There we saw a great stone shaft sunk down into the rock of the floor. On this was a delicate vibration recording instrument of some sort, with a needle that quivered rhythmically over several degrees of an arc.

"This tells of each move of the Quabos," said Aga. "It also tells us where they will break through the city wall. How near to us are they, Kilor?" she asked an attendant who was studying the dial, and who had

bowed respectfully to Aga and myself as we approached.

"They will break into the city in four rixas at the present rate of advance, Your Majesty."

Four rixas! In a little over sixteen days, as we count time, the city of Zyobor would be delivered into the hands—or, rather, tentacles—of the slimy, starving demons that huddled in the cavern outside!

Somberly we followed Aga back to her apartment.

"As thou seest," she murmured, "there is nothing to be done. We can only resign ourselves to the fate that nears us, and enjoy as much as may be the few remaining rixas...."

She glanced at me.

The Professor's dry, cool voice cut across our wordless, engrossed communion.

"I don't think we'll give up quite as easily as all that.

We can at least try to outwit our enemies. If it does nothing else for us, the effort can serve to distract our minds."

He drew from his pocket a sheet of parchment and the stub of his last remaining pencil. His fingers busied themselves apparently idly in the tracing of geometric lines.

"Looking ahead to the exact details of our destruction," he mused coolly, "we see that our most direct and ominous enemy is the sea itself. When the city is flooded, we drown—and later the Quabos can enter at will."

He drew a few more lines, and marked a cross at a point in the outer rim of the diagram.

"What will happen? The Quabos force through the last shell of the city wall. The water from their tunnel floods into Zyobor. But—and mark me well—*only* the water from the tunnel! The outer end, remember, is blocked off in their pressure-reducing process. The vast body of the sea itself cannot immediately be let

in here because the Quabos must take as long a time to re-accustom themselves to its pressure as they did to work out of it."

He spread the parchment sheet before us.

"Is this a roughly accurate plan of the city?" he asked Aga.

She inclined her lovely head.

"And this," indicating the cross, "is the spot where the Quabos will break in?"

Again she nodded, shuddering.

"Then tell me what you think of this," said the Professor.

And he proceeded to sketch out a plan so simple, and yet so seemingly efficient, that the rest of us gazed at him with wordless admiration.

"My friend, my friend," whispered Aga at last, "thou

hast saved us. Thou art the guardian hero of Zyobor
—"

"Not too fast, Your Highness," interrupted the Professor with his frosty smile. "I shall be much surprised if this little scheme actually saves the city. We may find the rock so thick there that our task is hopeless—though I imagine the Quabos picked a thin section for help in their own plans."

A vague look came into his eyes.

"I must certainly get my hands on one of these monsters ... superhumanly intelligent fish ... marvelous—akin to the octopus, perhaps?"

He wandered off, changed from the resourceful schemer to the dreamy man of scientific abstractions.

The Queen gazed after him with wonder in her eyes.

"A great man," she murmured, "but is he—a little mad?"

"No, only a little absent-minded," I replied. Then, "Come on, Stanley. We'll round up every able bodied citizen in Zyobor and get to work. I suppose they have some kind of rock drilling machinery here?"

They had. And they strangely resembled our own rock drills: revolving metal shafts, driven by gas turbines, tipped with fragments of the same crystal that glittered so profusely in the palace walls. Another proof that practically every basic, badly needed tool had been invented again and again, in all lands and times, as the necessity for it arose.

With hundreds of the powerful men of Zyobor working as closely together as they could without cramping each others movements, and with the whole city resounding to the roar of the machinery, we labored at the defence that might possibly check the advance of the hideous Quabos.

And with every breath we drew, waking or sleeping, we realized that the cold blooded, inhuman invaders had crept a fraction of an inch closer in their tunneling.

The Quabos against the Zyobites! Fish against man! Two diametrically opposed species of life in a struggle to the death! Which of us would survive?

The hour of the struggle approached. Every soul in Zyobor moved in a daze, with strained face and fear haunted eyes. Their proficiency in mental telepathy was a curse to them now: every one carried constantly, transmitted from the brains of the servant-fish outposts, a thought picture of that outer cavern in the murky depths of which writhed the thousands of crowding Quabos. Each mind in Zyobor was in continual torment.

Spared that trouble, at least, Stanley and the Professor and I walked down to the fortification we had so hastily contrived. It was finished. And none too soon: the vibration indicator in the palace vault told us that only two feet of rock separated us from the burrowing monsters!

The Professor's scheme had been to cut a long slot down through the rock floor of the city to the roof of the vast, mysterious body of water below.

This slot was placed directly in front of the spot in the city wall where the Quabos were about to emerge. As they forced through the last shell of rock, the deluge of water, instead of drowning the city, was supposed to drain down the oblong vent. Any Quabos that were too near the tunnel entrance would be swept down too.

In silence we approached the edge of the great trough and stared down.

There was a stratum of black granite, fortunately only about thirty feet thick at this point, and then—the depths! A low roar reached our ears from far, far beneath us. A steady blast of ice cold air fanned up against us.

The Professor threw down a large fragment of rock. Seconds elapsed and we heard no splash. The unseen surface was too far below for the noise of the rock's fall to carry on up to us.

"The mystery of this ball of earth on which we live!" murmured the Professor. "Here is this enormous

underground body of water. We are far below sea level. Where, then, is it flowing? What does it empty into? Can it be that our planet is honeycombed with such hollows as this we are in? And is each inhabited by some form of life?"

He sighed and shook his head.

"The thought is too big! For, if that were true, wouldn't the seas be drained from the surface of the earth should an accidental passage be formed from the ocean bed down to such a giant river as this beneath us? How little we know!"

The wild clamor of an alarm bell interrupted his musing. From all the city houses poured masses of people, to form in solid lines behind the large well.

In addition to men, there were many women in those lines, tall and strong, ready to stand by their mates as long as life was left them. There were children, too, scarcely in their teens, prepared to fight for the existence of the race. Every able-bodied Zyobite was mustered against the cold-blooded Things that

pressed so near.

The arms of these desperate fighters were pitiful compared to our own war weapons. With no need in the city for fighting engines, none had ever been developed. Now the best that could be had was a sort of ax, used for dissecting the mound-fish, and various knives fashioned for peaceful purposes.

Again the bell clamored forth a warning, this time twice repeated. Every hand grasped its weapon. Every eye went hopefully to the hole in the floor on which our immediate fate depended, then valiantly to the section of wall above it.

This quivered perceptibly. A heavy, pointed instrument broke through; was withdrawn; and a hissing stream of water spurted out.

The Quabos were about to break in upon us!

With a crash that made the solid rock tremble, a section of the wall collapsed. It was the top half of the end of the Quabos' tunnel. They had so wrought that

the lower half stayed in place—a thing we did not have time to recognize as significant until later.

A solid wall of water, in which writhed dozens of tentacled monsters, was upon us, and we had time for nothing but action.

The ditch had of necessity been placed directly under the Quabos' entrance. The first rush of water carried half over it. With it were borne scores of the cold-blooded invaders.

In an instant we were standing knee deep in a torrent that tore at our footing, while we hacked frantically with knives and axes at the slimy tentacles that reached up to drag us under.

A soft, horrible mass swept against my legs. I was overthrown. A tentacle slithered around my neck and constricted viciously like a length of rotten cable. I sawed at it with the long, notched blade I carried. Choking for air, I felt the pressure relax and scrambled to my knees.

Two more tentacles went around me, one winding about my legs and the other crushing my waist. Two huge eyes glared fiendishly at me.

I plunged the knife again and again into the barrel-shaped head. It did not bleed: a few drops of thin, yellowish liquid oozed from the wounds but aside from this my slashing seemed to make no impression.

In a frenzy I defended myself against the nightmare head that was winding surely toward me. Meanwhile I devoted every energy to keeping on my feet. If I ever went under again—

It seemed to me that the creature was weakening. With redoubled fury I hacked at the spidery shape. And gradually, when it seemed as though I could not withstand its weight and crushing tentacles another second, it slipped away and floated off on the shallow, roaring rapids.

For a moment I stood there, catching my breath and regaining my strength. Shifting, terrible scenes flashed before my eyes.

A tall Zyobite and an almost equally stalwart woman were both caught by one gigantic Quabo which had a tentacle around the throat of each. The man and woman were chopping at the viscous, gruesome head. One of the Thing's eyes was gashed across, giving it a fearsome, blind appearance. It heaved convulsively, and the three struggling figures toppled into the water and were swirled away.

The Professor was almost buried by a Quabo that had all four of its tentacles wound about him. As methodically as though he were in a laboratory dissecting room, he was cutting the slippery lengths away, one by one, till the fourth parted and left him free.

A giant Zyobite was struggling with two of the monsters. He had an ax in each hand, and was whirling them with such strength and rapidity that they formed flashing circles of light over his head. But he was torn down at last and borne off by the almost undiminished flood that gushed from the tunnel.

And now, without warning, a heavy soft body flung

against my back, and the accident most to be dreaded in that mêlée occurred.

I was knocked off my feet! My head was pressed under the water. On my chest was a mass that was yielding but immovable, soft but terribly strong. Animated, firm jelly! I had no chance to use my knife. My arms were held powerless against my sides.

Water filled my nose and mouth. I strangled for breath, heaving at the implacable weight that pinned me helpless. Bright spots swirled before my eyes. There was a roaring in my ears. My lungs felt as though filled with molten lead. I was drowning....

Vaguely I felt the pressure loosen at last. An arm—with good, solid flesh and bone in it—slipped under my shoulders and dragged me up into the air.

"Don't you know—can't drown a fish—holding it under water?" panted a voice.

I opened my eyes and saw Stanley, his face pale with the thrill of battle, his chin jutting forward in a

berserk line, his eyes snapping with eager, wary fires.

I grinned up at him and he slapped me on the back—almost completing the choking process started by the salt water I'd inhaled.

"That's better. Now—at it again!"

I don't remember the rest of the tumult. The air seemed filled with loathsome tentacles and bright metal blades. It was a confused eternity until the decreased volume of water in the tunnel gave us a respite....

As the tunnel slowly emptied the pressure dropped, and the incoming flood poured squarely into the trough instead of half over it. From that moment there was very little more for us to do.

Our little army—with about a fourth of its number gone—had only to guard the ditch and see that none of the Quabos caught the edges as they hurtled out of their passage.

For perhaps ten minutes longer the water poured from the break in the wall, with now and then a doomed Quabo that goggled horribly at us as it was dashed down the hole in the floor to whatever awesome depths were beneath.

Then the flow ceased. The last oleaginous corpse was pushed over the edge. And the city, save for an ankle-deep sheet of water that was rapidly draining out the vents in the streets, presented its former appearance.

The Zyobites leaned wearily against convenient walls and began telling themselves how fortunate they were to have been spared what seemed certain destruction.

The Professor didn't share in the general feeling of triumph.

"Don't be so childishly optimistic!" he snapped as I began to congratulate him on the victory his ditch had given us. "Our troubles aren't over yet!"

"But we've proved that we can stand up to them in a hand-to-tentacle fight—"

His thin, frosty smile appeared.

"One of those devils, normally, is stronger than any three men. The only reason all of us weren't destroyed at once is that they were slowly suffocating as they fought. The foot and a half of water we were in wasn't enough to let their gills function properly. Now if they were able to stand right up to us and not be handicapped by lack of water to breathe ... I wonder.... Is that part of their plan? Is there any way they could manage ...?"

"But, Professor," I argued, "it's all over, isn't it? The tunnel is emptied, and all the Quabos are—"

"The tunnel isn't emptied. It's only *half* emptied! I'll show you."

He called Stanley; and the three of us went to the break.

"See," the Professor pointed out to us as we approached the jagged hole, "the Quabos only drilled through the top half of their tunnel ending. That

means that the tunnel still has about four feet of water in it—enough to accommodate a great many of the monsters. There may be four or five hundred of them left in there; possibly more. We can expect renewed hostilities at any time!"

"But won't it be just a repetition of the first battle?" remonstrated Stanley. "In the end they'll be killed or will drown for lack of water as these first ones did."

The Professor shook his head.

"They're too clever to do that twice. The very fact that they kept half their number in reserve shows that they have some new trick to try. Otherwise they'd all have come at once in one supreme effort."

He paced back and forth.

"They're ingenious, intelligent. They're fighting for their very existence. They must have figured out some way of breathing in air, some way of attacking us on a more even basis in case that first rush went wrong. What can it be?"

"I think you're borrowing trouble before it is necessary—" I began, smiling at his elaborate, scientific pessimism. But I was interrupted by a startled shout from Stanley.

"Professor Martin," he cried, pointing to the tunnel mouth. "Look!"

Like twin snakes crawling up to sun themselves, two tentacles had appeared over the rock rim. They hooked over the edge; and leisurely, with grim surety of invulnerability, the barrel-like head of a Quabo balanced itself on the ledge and glared at us.

For a moment we stared, paralyzed, at the Thing. And, during that moment it squatted there, as undistressed as though the air were its natural element, its gills flapping slowly up and down supplying it with oxygen.

The thing that held us rooted to the spot with fearful amazement was the fantastic device that permitted it

to be almost as much at home in air as in water.

Over the great, globular head was set an oval glass shell. This was filled with water. A flexible metal tube hung down from the rear. Evidently it carried a constant stream of fresh water. As we gazed we saw intermittent trickles emerging from the bottom of the crystalline case.

Point for point the creature's equipment was the same as diving equipment used by men, only it was exactly opposite in function. A helmet that enabled a fish to breathe in air, instead of a helmet to allow a man to breathe in water!

Stanley was the first of us to recover from the shock of this spectacle. He faced about and raised his voice in shouts of warning to the resting Zyobites. For other glass encased monsters had appeared beside the first, now.

One by one, in single file like a line of enormous marching insects, they crawled down the wall and humped along on their tentacles—around the ditch

and toward us!

The deadly infallibility of that second attack!

The Quabos advanced on us like armored tanks bearing down on defenceless savages. Their glass helmets, in addition to containing water for their breathing, protected them from our knives and axes. We were utterly helpless against them.

They marched in ranks about twenty yards apart, each rank helping the one in front to carry the cumbersome water-hoses which trailed back to the central water supply in the tunnel.

Their movements were slow, weighted down as they were by the great glass helmets, but they were appallingly sure.

We could not even retard their advance, let alone stop it. Here were no suffocating, faltering creatures. Here were beings possessed of their full vigor, each one equal to three of us even as the Professor had conjectured. Their only weak points were their

tentacles which trailed outside the glass cases. But these they kept coiled close, so that to reach them and hack at them we had to step within range of their terrific clutches.

The Zyobites fought with the valor of despair added to their inherent noble bravery. Man after man closed with the monstrous, armored Things—only to be seized and crushed by the weaving tentacles.

Occasionally a terrific blow with an ax would crack one of the glass helmets. Then the denuded Quabo would flounder convulsively in the air till it drowned. But there were all too few of these individual victories. The main body of the Quabos, rank on rank, dragging their water-hose behind them, came on with the steadiness of a machine.

Slowly we were driven back down the broad street and toward the palace. As we retreated, old people and children came from the houses and went with us, leaving their dwellings to the mercy of the monsters.

A block from the palace we bunched together and, by

sheer mass and ferocity, actually stopped the machinelike advance for a few moments.

Miscellaneous weapons had been brought from the houses—sledges, stone benches, anything that might break the Quabos' helmets—and handed to us in silence by the noncombatants.

Somebody tugged at my sleeve. Looking down I saw a little girl. She had dragged a heavy metal bar out to the fray and was trying to get some fighter's attention and give it to him.

I seized the formidable weapon and jumped at the nearest Quabo, a ten-foot giant whose eyes were glinting gigantically at me through the distorting curve of the glass.

Disregarding the clutching tentacles entirely, I swung the bar against the helmet. It cracked. I swung again and it fell in fragments, spilling the gallons of water it had contained.

The tentacles wound vengefully around me, but in a few seconds they relaxed as the thing gasped out its

life in the air.

I turned to repeat the process on another if I could, and found myself facing the Queen. Her head was held bravely high, though the violet of her eyes had gone almost black with fear and repulsion of the terrible things we fought.

"Aga!" I cried. "Why art thou here! Go back to the palace at once!"

"I came to fight beside thee," she answered composedly, though her delicate lips quivered. "All is lost, it seems. So shall I die beside thee."

I started to reply, to urge her again to seek the safety of the palace. But by now the deadly advance of the tentacled demons had begun once more.

Fighting vainly, the population of Zyobor was swept into the palace grounds, then into the building itself.

Men, women and children huddled shoulder to shoulder in the cramping quarters. An ironic picture

came to me of the crowding masses of Quabos stuffed into the protection of the outer cave, waiting the outcome of the fight being waged by their warriors. Here were we in a similar circumstance, waiting for the battle to be decided. Though there was little doubt in the minds of any of us as to what the outcome would be.

Guards, the strongest men of the city, were stationed with sledges at the doors and windows. The Quabos, able only to enter one at a time, halted a moment and there was a badly needed breathing spell.

"We've got to find some drastic means of defence," said the Professor, "or we won't last another three hours."

"If you asked me, I'd say we couldn't last another three hours anyway," replied Stanley with a shrug. "These fish have out-thought us!"

"Nonsense! There may still be a way—"

"A brace of machine-guns...." I murmured hopefully.

"You might as well wish for a dozen light cannon!" snapped the Professor. "Please try to concentrate, and see if any effective weapon suggests itself to you—something more available at the moment than machine-guns."

In silence the three of us racked our brains for a means of defence. Aga, leaving for a time the task of soothing her more hysterical subjects, came quietly over to us and sat on the bench beside me.

Frankly I could think of nothing. To my mind we were surely doomed. What arms could possibly be contrived at such short notice? What weapon could be called forth to be effective against the thick glass helmets?

But as I glanced at Stanley I saw his face set in a new expression as his thoughts took a turn that suggested possible salvation.

"Glass," he muttered. "Glass. What destroys it? Sharp blows ... certain acids ... variation in temperature ... heat and cold.... That's it! *That's it!*"

He turned excitedly to the Queen.

"I think we have it! At least it's worth trying. If there is any tubing around...." He stopped as he realized he was talking in English, and resumed stiltedly in Aga's own language.

"Hast thou, in the palace, any lengths of pipe like to that which the Quabos drag behind them?"

"No ..." Aga began, her eyes round and wondering. Then she interrupted herself. "Ah, yes! There is! In a vault near that of Kilor's there is a great spool of it. He had it fashioned to carry air for one of his experiments—"

"Come along!" cried Stanley. "I'll explain what I have in mind while we dig up this coil of hose."

A score of Zyobite workmen were gathered at once. The length of hose—made of some linen-like fabric of tough, shredded sea-weed and covered with a flexible metal sheath—was cut into three pieces each about fifty yards long. These were connected to three of the

largest gas vents of the palace.

Stanley, the Professor and I each took an end. And we prepared to fight, with fire, the creatures of water.

"It ought to work," Stanley, repeated several times as though trying to reassure himself as well as us. "It's simple enough: the water in those helmets is ice cold: if fire is suddenly squirted against them they'll crack with the uneven expansion."

"Unless," retorted the Professor, "their glass has some special heat and cold resisting quality."

Stanley shrugged.

"It may well have some such properties. How such creatures can make glass at all is beyond me!"

Dragging our hose to the big front entrance of the palace, and warning the crowded people to keep their feet clear of it, we prepared to test out the efficiency of this, our last resource against the enemy.

For an instant we paused just inside the doorway, looking out at the ugly, glassed-in Things that were massing to attack us again.

The ranks of Quabos had closed in now, till they extended down the street for several hundred yards in close formation—a forest of great pulpy heads with huge eyes that glared unblinkingly at the glittering, pink building that was their objective.

"Light up!" ordered Stanley, setting an example by touching his hose nozzle to the nearest wall jet. A spurt of fire belched from his hose, streaming out for four or five feet in a solid red cone. The Professor and I touched off our torches; and we moved slowly out the door toward the ranks of Quabos.

"Don't try to save yourselves from their tentacles," advised Stanley. "Walk right up to them, direct the fire against their helmets, and damn the consequences. If they grip too hard you can always play the torch on their tentacles till they think better of it."

The Quabos' front line humped grimly toward us,

unblinking eyes glaring, tentacles writhing warily, little spurts of used water trickling from their helmets.

"Keep together," warned Stanley, "so that if any one of us loses his light he can get it from the hose of one of the other two. And—*Here they come!*"

There was no more time for commands. The Quabos in front, supplied with slack in their hoses by those behind, leaped at us with incredible agility. We fell back a step so that none should get at our backs.

The last stand was begun.

It was not a battle so much as a series of fierce duels. The Quabos realized their new danger instantly, and devoted all their efforts to extinguishing our torches. We parried and thrust with the flaming hoses in an equally desperate effort to prevent it.

One of them scuttled toward me like a great crab. A tentacle darted toward my right arm. Another was pressed against the nozzle. There was a sickening

smell—and the tentacle was jerked spasmodically away.

I caught the hose in my left hand and turned the fiery jet against the water-filled helmet.

A shout of savage exultation broke from my lips. Hardly, had the flame touched the glass before it cracked! There was a report like a pistol shot—and a miniature Niagara of water and splintered glass poured at my feet!

The tentacle around my arm tightened, then relaxed. The monster shuddered in a convulsive heap on the ground.

I went toward the next one, swinging the flaring hose in a slow arc as I advanced. The creature lunged at me and threshed at the burning jet with all four of its feelers. But it had been exposed to the air for a long time now. The ghastly tentacles were dry; withered and soft. A touch of the fire seared them unmercifully.

Nevertheless with a swift move it slapped a tentacle

squarely down over the hose nozzle. The flame was extinguished as the flame of a candle is pinched out between thumb and forefinger. I retreated.

"Catch!" came a voice behind me.

The Professor swung his four-foot jet my way. I held my hose to it, and the flame burst out again. A touch at my grisly antagonist's helmet—a sharp crack—the welcome rush of water over the cream-colored grass—and another monster was writhing in the death throes!

Keeping close together, the three of us faced the massed Quabos in the palace grounds. Again and again the fiery weapon of one or the other of us was dashed out—to be re-lighted from the nearest hose. Again and again loud detonations heralded the collapse of more of the invaders.

But it seemed as though their flailing tentacles were as myriad as the stars they had never seen. It seemed

as though their numbers would never appreciably diminish. We thrust and parried till our arms grew numb. And still there appeared to be hundreds of the Quabos left.

By order of the Queen three stout Zyobites stepped up to us and relieved us of our exhausting labor. Gladly we handed the hoses to them and went to the palace for a much needed rest.

Two more shifts of fighters took the flaming jets before the monsters began the retreat slowly back toward their tunnel. And here the Professor took command again.

"We mustn't let them get away to try some new scheme!" he snapped. "Martin, take fifty men and beat them back to the break in the wall. Go around a side street. They move so slowly that you can easily cut off their retreat."

"There isn't any more hose—" began Stanley.

"There's plenty of it. The Quabos brought it with them." The Professor turned to me again. "Take metal-saws with you. Cut sections of the Quabos water-hose and connect them to the nearest wall jets. Run!"

I ran, with fifty of the men of Zyobor close behind me. We dodged out the side of the palace grounds least guarded by the Quabos, ducking between their ranks like infantry men threading through an opposition of powerful but slow-moving tanks. Four of our number were caught, but the rest got through unscathed.

Down a side street we raced, and along a parallel avenue toward the tunnel. As we went I prayed that all the Quabos had centered their attention on the palace and left their vulnerable water-hoses unguarded.

They had! When we stole up the last block toward the break we found the nearest Quabo was a hundred yards down the street—and working further away with every move.

At once we set to work on the scores of hoses that quivered over the floor with each move of the distant monsters.

A Zyobite with the muscles of a Hercules swung his ax mightily down on a hose. The metal was soft enough to be sheered through by the stroke. The cut ends were smashed so that they could not be crammed down over the tapering jets; but we could use our metal-saws for cleaner severances at the other ends.

The giant with the ax stepped from hose to hose. Lengths were completed with the saws. A man was placed at each jet to hold the connections in position. Before the Quabos had reached us we had rigged six fire-hoses and had cut through forty or fifty more water-lines.

The end was certain and not long in coming.

We sprayed the monsters with fire as workmen spray fruit trees with insect poison. Stanley, the Professor and a Zyobite came up in the rear with their three

hoses.

Caught between the two forces, the beaten fish milled in hopeless confusion and indecision.

In half an hour they were all reduced to huddles of slimy wet flesh that dotted the pavement from the break back to the palace grounds. The invaders were completely annihilated—and the city of Zyobor was saved!

"Now," said the Professor triumphantly, "we have only to knock out the bottom half of the tunnel wall, empty the tunnel and make sure there are no more Quabos lurking there. After that we can fill it in with solid cement. The Queen can order her fish-servants to guard the outer cave and see that no food gets in to the starving monsters there. The war is over, gentlemen. The Quabos are as good as exterminated at this moment. And I can get back to my zoological work...."

Stanley and I looked at each other. We knew each others thoughts well enough.

He could resume his companionship with the beautiful Mayis. And I—I had Aga....

With the menace of the Quabos banished forever, the city of Zyobor resumed its normal way.

The citizens lowered their dead into the great well we had cut, with appropriate rites performed by the Queen. The daily tasks and pleasures were picked up where they had been dropped. The haunting fear died from the eyes of the people.

Shortly afterward, with great ceremony and celebration, I was made King of Zyobor, to rule by Aga's side. Stanley took Mayis for his wife. He is second to me in power. The Professor is the official wise man of the city.

Life flows smoothly for us in this pink lighted community. We are more than content with our lot here. Our only concern has been the grief that must have been occasioned our relatives and friends when the *Rosa* sailed home without us.

Now we have thought of a way in which, with luck, we may communicate with the upper world. By relays of my Queen's fish-servants we believe we can send up the Professor's invaluable notes* and this informal account of what has happened since we left San Francisco that....

(Editor's note: There was no trace of any "notes." The yacht, *Rosa*, was reported lost with all hands in a hurricane off New Zealand. Aboard her were a Professor George Berry and the owner, Stanley Browne. There is no record, however, of any passenger by the name of Martin Grey. To date no one has taken this document seriously enough to consider financing an expedition of investigation to Penguin Deep.)

#50 The Murder Machine, By Hugh Barnett Cave:

Four lives lay helpless before the murder machine,
the uncanny device by which hypnotic thought waves
are filtered through men's minds to mold them into
murdering tools.

Bigotry:

Warnings:

I shall probably kill you

- - -

It was dusk, on the evening of December 7, 1906, when I first encountered Sir John Harmon. At the moment of his entrance I was standing over the table in my study, a lighted match in my cupped hands and a pipe between my teeth. The pipe was never lit.

I heard the lower door slam shut with a violent clatter. The stairs resounded to a series of unsteady footbeats, and the door of my study was flung back. In the opening, staring at me with quiet dignity, stood a young, careless fellow, about five feet ten in height and decidedly dark of complexion. The swagger of his entrance branded him as an adventurer. The ghastly pallor of his face, which was almost colorless, branded him as a man who has found something more than mere adventure.

"Doctor Dale?" he demanded.

"I am Doctor Dale."

He closed the door of the room deliberately, advancing toward me with slow steps.

"My name is John Harmon—Sir John Harmon. It is unusual, I suppose," he said quietly, with a slight shrug, "coming at this late hour. I won't keep you long."

He faced me silently. A single glance at those strained features convinced me of the reason for his coming. Only one thing can bring such a furtive, restless stare to a man's eyes. Only one thing—fear.

"I've come to you. Dale, because—" Sir John's fingers closed heavily over the edge of the table—"because I am on the verge of going mad."

"From fear?"

"From fear, yes. I suppose it is easy to discover. A single look at me...."

"A single look at you," I said simply, "would convince any man that you are deadly afraid of something. Do you mind telling me just what it is?"

He shook his head slowly. The swagger of the poise

was gone; he stood upright now with a positive effort, as if the realization of his position had suddenly surged over him.

"I do not know," he said quietly. "It is a childish fear—fear of the dark, you may call it. The cause does not matter; but if something does not take this unholy terror away, the effect will be madness."

I watched him in silence for a moment, studying the shrunken outline of his face and the unsteady gleam of his narrowed eyes. I had seen this man before. All London had seen him. His face was constantly appearing in the sporting pages, a swaggering member of the upper set—a man who had been engaged to nearly every beautiful woman in the country—who sought adventure in sport and in night life, merely for the sake of living at top speed. And here he stood before me, whitened by fear, the very thing he had so deliberately laughed at!

"Dale," he said slowly, "for the past week I have been thinking things that I do not want to think and doing things completely against my will. Some outside

power—God knows what it is—is controlling my very existence."

He stared at me, and leaned closer across the table.

"Last night, some time before midnight," he told me, "I was sitting alone in my den. Alone, mind you—not a soul was in the house with me. I was reading a novel; and suddenly, as if a living presence had stood in the room and commanded me, I was forced to put the book down. I fought against it, fought to remain in that room and go on reading. And I failed."

"Failed?" My reply was a single word of wonder.

"I left my home: because I could not help myself. Have you ever been under hypnotism, Dale? Yes? Well, the thing that gripped me was something similar—except that no living person came near me in order to work his hypnotic spell. I went alone, the whole way. Through back streets, alleys, filthy dooryards—never once striking a main thoroughfare—until I had crossed the entire city and reached the west side of the square. And there, before a big gray town-house, I

was allowed to stop my mad wandering. The power, whatever it was, broke. I—well, I went home."

Sir John got to his feet with an effort, and stood over me.

"Dale," he whispered hoarsely, "what was it?"

"You were conscious of every detail?" I asked.

"Conscious of the time, of the locality you went to? You are sure it was not some fantastic dream?"

"Dream! Is it a dream to have some damnable force move me about like a mechanical robot?"

"But.... You can think of no explanation?" I was a bit skeptical of his story.

He turned on me savagely.

"I have no explanation. Doctor," he said curtly. "I came to you for the explanation. And while you are thinking over my case during the next few hours, perhaps you can explain this: when I stood before that

gray mansion on After Street, alone in the dark, there was murder in my heart. I should have killed the man who lived in that house, had I not been suddenly released from the force that was driving me forward!"

Sir John turned from me in bitterness. Without offering any word of departure, he pulled open the door and stepped across the sill. The door closed, and I was alone.

That was my introduction to Sir John Harmon. I offer it in detail because it was the first of a startling series of events that led to the most terrible case of my career. In my records I have labeled the entire case "The Affair of the Death Machine."

Twelve hours after Sir John's departure—which will bring the time, to the morning of December 8—the headlines of the Daily Mail stared up at me from the table. They were black and heavy: those headlines, and horribly significant. They were:

FRANKLIN WHITE Jr. FOUND
MURDERED

Midnight Marauder Strangles Young Society Man in West-End Mansion

I turned the paper hurriedly, and read:

Between the hours of one and two o'clock this morning, an unknown murderer entered the home of Franklin White, Jr., well known West-End sportsman, and escaped, leaving behind his strangled victim.

Young White, who is a favorite in London upper circles, was discovered in his bed this morning, where he had evidently lain dead for many hours. Police are seeking a motive for the crime, which may have its origin in the fact that White only recently announced his engagement to Margot Vernee, young and exceedingly pretty French débutante.

Police say that the murderer was evidently an amateur, and that he made no attempt to cover his crime. Inspector Thomas Drake of Scotland Yard has the case.

There was more, much more. Young White had evidently been a decided favorite, and the murder had been so unexpected, so deliberate, that the Mail reporter had made the most of his opportunity for a story. But aside from what I have reprinted, there was only a single short paragraph which claimed my attention. It was this:

The White home is not a difficult one to enter. It is a huge gray town-house, situated just off the square, in After Street. The murderer entered by a low French window, leaving it open.

I have copied the words exactly as they were printed. The item does not call for any comment.

But I had hardly dropped the paper before she stood before me. I say "she"—it was Margot Vernee, of course—because for some peculiar reason I had expected her. She stood quietly before me, her cameo face, set in the black of mourning, staring straight into mine.

"You know why I have come?" she said quickly.

I glanced at the paper on the table before me, and nodded. Her eyes followed my glance.

"That is only part of it, Doctor," she said. "I was in love with Franklin—very much—but I have come to you for something more. Because you are a famous psychologist, and can help me."

She sat down quietly, leaning forward so that her arms rested on the table. Her face was white, almost as white as the face of that young adventurer who had come to me on the previous evening. And when she spoke, her voice was hardly more than a whisper.

"Doctor, for many days now I have been under some strange power. Something frightful, that compels me to think and act against my will."

She glanced at me suddenly, as if to note the effect of her words. Then:

"I was engaged to Franklin for more than a month, Doctor: yet for a week now I have been commanded—commanded—by some awful force, to return to—to a

man who knew me more than two years ago. I can't explain it. I did not love this man; I hated him bitterly. Now comes this mad desire, this hungering, to go to him. And last night—"

Margot Vernee hesitated suddenly. She stared at me searchingly. Then, with renewed courage, she continued.

"Last night, Doctor, I was alone. I had retired for the night, and it was late, nearly three o'clock. And then I was strangely commanded, by this awful power that has suddenly taken possession, of my soul, to go out. I tried to restrain myself, and in the end I found myself walking through the square. I went straight to Franklin White's home. When I reached there, it was half past three—I could hear Big Ben. I went in—through the wide French window at the side of the house. I went straight to Franklin's room—*because I could not prevent myself from going.*"

A sob came from Margot's lips. She had half risen from her chair, and was holding herself together with a brave effort. I went to her side and stood over her.

And she, with a half crazed laugh, stared up at me.

"He was dead when I saw him!" she cried. "Dead! Murdered! That infernal force, what ever it was, had made me go straight to my lover's side, to see him lying there, with those cruel finger marks on his throat—dead, I tell you, I—oh, it is horrible!"

She turned suddenly.

"When I saw him," she said bitterly, "the sight of him—and the sight of those marks—broke the spell that held me. I crept from the house as if I had killed him. They—they will probably find out that I was there, and they will accuse me of the murder. It does not matter. But this power—this awful thing that has been controlling me—is there no way to fight it?"

I nodded heavily. The memory, of that unfortunate fellow who had come to me with the same complaint was still holding me. I was prepared to wash my hands of the whole horrible affair. It was clearly not a medical case, clearly out of my realm.

"There is a way to fight it," I said quietly. "I am a doctor, not a master of hypnotism, or a man who can discover the reasons behind that hypnotism. But London has its Scotland Yard, and Scotland Yard has a man who is one of my greatest comrades...."

She nodded her surrender. As I stepped to the telephone, I heard her murmur, in a weary, troubled voice:

"Hypnotism? It is not that. God knows what it is. But it has always happened when I have been alone. One cannot hypnotise through distance...."

And so, with Margot Vernee's consent, I sought the aid of Inspector Thomas Drake, of Scotland Yard. In half an hour Drake stood beside me, in the quiet of my study. When he had heard Margot's story, he asked a single significant question. It was this:

"You say you have a desire to go back to a man who was once intimate with you. Who is he?"

Margot looked at him dully.

"It is Michael Strange," she said slowly. "Michael Strange, of Paris. A student of science."

Drake nodded. Without further questioning he dismissed my patient; and when she had gone, he turned to me.

"She did not murder her sweetheart, Dale" he said. "That is evident. Have you any idea who did?"

And so I told him of that other young man. Sir John Harmon, who had come to me the night before. When I had finished. Drake stared at me—stared through me—and suddenly turned on his heel.

"I shall be back, Dale," he said curtly. "Wait for me!"

Wait for him! Well, that was Drake's peculiar way of going about things. Impetuous, sudden—until he faced some crisis. Then, in the face of danger, he became a cold, indifferent officer of Scotland Yard.

And so I waited. During the twenty-four hours that elapsed before Drake returned to my study, I did my

best to diagnose the case before me. First, Sir John Harmon—his visit to the home of Franklin White. Then—the deliberate murder. And, finally, young Margot Vernee, and her confession. It was like the revolving whirl of a pinwheel, this series of events: continuous and mystifying, but without beginning or end. Surely, somewhere in the procession of horrors, there would be a loose end to cling to. Some loose end that would eventually unravel the pinwheel!

It was plainly not a medical affair, or at least only remotely so. The thing was in proper hands, then, with Drake following it through. And I had only to wait for his return.

He came at last, and closed the door of the room behind him. He stood over me with something of a swagger.

"Dale, I have been looking into the records of this Michael Strange," he said quietly. "They are interesting, those records. They go back some ten years, when this fellow Strange was beginning his study of science. And now Michael Strange is one of

the greatest authorities in Paris on the subject of mental telegraphy. He has gone into the study of human thought with the same thoroughness that other scientists go into the subject of radio telegraphy. He has written several books on the subject."

Drake pulled a tiny black volume from the pocket of his coat and dropped it on the table before me. With one hand he opened it to a place which he had previously marked in pencil.

"Read it," he said significantly.

I looked at him in wonder, and then did as he ordered. What I read was this:

"Mental telegraphy is a science, not a myth. It is a very real fact, a very real power which can be developed only by careful research. To most people it is merely a curiosity. They sit, for instance, in a crowded room at some uninteresting lecture, and stare continually at the back of some unsuspecting companion until that companion, by the power of

suggestion, turns suddenly around. Or they think heavily of a certain person nearby, perhaps commanding him mentally to hum a certain popular tune, until the victim, by the power of their will, suddenly fulfills the order. To such persons, the science of mental telegraphy is merely an amusement.

"And so it will be, until science has brought it to such a perfection that these waves of thought can be broadcast—that they can be transmitted through the ether precisely as radio waves are transmitted. In other words, mental telegraphy is at present merely a mild form of hypnotism. Until it has been developed so that those hypnotic powers can be directed through space, and directed accurately to those individuals to whom they are intended, this science will have no significance. It remains for scientists of to-day to bring about that development."

I closed the book. When I looked up, Drake was watching me intently, as if expecting me to say something.

"Drake," I said slowly, more to myself than to him, "the pinwheel is beginning to unravel. We have found the beginning thread. Perhaps, if we follow that thread...."

Drake smiled.

"If you'll pick up your hat and coat, Dale," he interrupted, "I think we have an appointment. This Michael Strange, whose book you have just enjoyed so immensely, is now residing on a certain quiet little side street about three miles from the square, in London!"

I followed Drake in silence, until we had left Cheney Lane in the gloom behind us. At the entrance to the square my companion called a cab; and from there on we rode slowly, through a heavy darkness which was blanketed by a wet, penetrating fog. The cabby, evidently one who knew my companion by sight (and what London cabby does not know his Scotland Yard men!) chose a route that twisted through gloomy, uninhabited side streets, seldom winding into the main route of traffic.

As for Drake, he sank back in the uncomfortable seat and made no attempt at conversation. For the entire first part of our journey he said nothing. Not until we had reached a black, unlighted section of the city did he turn to me.

"Dale," he said at length, "have you ever hunted tiger?"

I looked at him and laughed.

"Why?" I replied. "Do you expect this hunt of ours will be something of a blind chase?"

"It will be a blind chase, no doubt of it," he said. "And when we have followed the trail to its end, I imagine we shall find something very like a tiger to deal with. I have looked rather deeply into Michael Strange's life, and unearthed a bit of the man's character. He has twice been accused of murder—murder by hypnotism—and has twice cleared himself by throwing scientific explanations at the police. That is the nature of his entire history for the past ten years."

I nodded, without replying. As Drake turned away from me again, our cab poked its laboring nose into a narrowing, gloomy street. I had a glimpse of a single unsteady street lamp on the corner, and a dim sign, "Mate Lane." And then we were dragging along the curb. The cab stopped with a groan.

I had stepped down and was standing by the cab door when suddenly, from the darkness in front of me, a strange figure advanced to my side. He glanced at me intently; then, seeing that I was evidently not the man he sought, he turned to Drake. I heard a whispered greeting and an undertone of conversation. Then, quietly, Drake stepped toward me.

"Dale," he said. "I thought it best that I should not show myself here to-night. No, there is no time for explanation now; you will understand later.

Perhaps"—significantly—"sooner than you anticipate. Inspector Hartnett will go through the rest of this pantomime with you."

I shook hands with Drake's man, still rather bewildered at the sudden substitution. Then, before I

was aware of it, Drake had vanished and the cab was gone. We were alone, Hartnett and I, in Mate Lane.

The home of Michael Strange—number seven—was hardly inviting. No light was in evidence. The big house stood like a huge, unadorned vault set back from the street, some distance from its adjoining buildings. The heavy steps echoed to our footbeats as we mounted them in the darkness; and the sound of the bell, as Hartnett pressed it came sharply to us from the silence of the interior.

We stood there, waiting. In the short interval before the door opened, Hartnett glanced at his watch (it was nearly ten o'clock), and said to me:

"I imagine, Doctor, we shall meet a blank wall. Let me do the talking, please."

That was all. In another moment the big door was pulled slowly open from the inside, and in the entrance, glaring out at us, stood the man we had come to see. It is not hard to remember that first impression of Michael Strange. He was a huge man,

gaunt and haggard, moulded with the hunched shoulders and heavy arms of a gorilla. His face seemed to be unconsciously twisted into a snarl. His greeting, which came only after he had stared at us intently, for nearly a minute, was curt and rasping.

"Well, gentlemen? What is it?"

"I should like a word with Dr. Michael Strange," said my companion quietly.

"I am Michael Strange."

"And I," replied Hartnett, with a suggestion of a smile, "am Raoul Hartnett, from Scotland Yard."

I did not see any sign of emotion on Strange's face. He stepped back in silence to allow us to enter. Then closing the big door after us, he led the way along a carpeted hall to a small, ill-lighted room just beyond. Here he motioned us to be seated, he himself standing upright beside the table, facing us.

"From Scotland Yard," he said, and the tone was

heavy with dull sarcasm. "I am at your service, Mr. Hartnett."

And now, for the first time, I wondered just why Drake had insisted on my coming here to this gloomy house in Mate Lane. Why he had so deliberately arranged a substitute so that Michael Strange should not come face to face with him directly. Evidently Hartnett had been carefully instructed as to his course of action—but why this seemingly unnecessary caution on Drake's part? And now, after we had gained admission, what excuse would Hartnett offer for the intrusion? Surely he would not follow the bull-headed rôle of a common policeman!

There was no anger, no attempt at dramatics, in Hartnett's voice. He looked quietly up at our host.

"Dr. Strange," he said at length, "I have come to you for your assistance. Last night, some time after midnight, Franklin White was strangled to death. He was murdered, according to substantial evidence, by the girl he was going to marry—Margot Vernee. I come to you because you know this girl rather well,

and can perhaps help Scotland Yard in finding her motive for killing White."

Michael Strange said nothing. He stood there, scowling down at my companion in silence. And I, too, I must admit, turned upon Hartnett with a stare of bewilderment. His accusation of Margot had brought a sense of horror to me. I had expected almost anything from him, even to a mad accusation of Strange himself. But I had hardly foreseen this cold blooded declaration.

"You understand, Doctor," Hartnett went on, in that same ironical drawl, "that we do not believe Margot Vernee did this thing herself. She had a companion, undoubtedly, one who accompanied her to the house on After Street, and assisted her in the crime. Who that companion was, we are not sure; but there is decidedly a case of suspicion against a certain young London sportsman. This fellow is known to have prowled about the White mansion both on the night of the murder and the night before."

Hartnett glanced up casually. Strange's face was a

total mask. When he nodded, the nod was the most even and mechanical thing I have ever seen. Certainly this man could control his emotions!

"Naturally, Doctor," Hartnett said, "we have gone rather deeply into the past life of the lady in question. Your name appears, of course, in a rather unimportant interval when Margot Vernee resided in Paris. And so we come to you in the hope that you can perhaps give us some slight bit of information—something that seems insignificant, perhaps, to you, but which may put us on the right track."

It was a careful speech. Even as Hartnett spoke it, I could have sworn that the words were Drake's, and had been memorized. But Michael Strange merely stepped back to the table and faced us without a word. He was probably, during that brief interlude, attempting to realize his position, and to discover just how much Raoul Hartnett actually knew.

And then, after his interim of silence, he came forward sullenly and stood over my comrade.

"I will tell you this much, Mr. Hartnett of Scotland Yard," he said bitterly: "My relations with Margot Vernee are not an open book to be passed through the clumsy fingers of ignorant police officers. As to this murder, I know nothing. At the time of it, I was seated in this room in company with a distinguished group of scientific friends. I will tell you, on authority, that Margot *did not murder her lover*. Why? Because she loved him!"

The last words were heavy with bitterness. Before they had died into silence, Michael Strange had opened the door of his study.

"If you please, gentlemen," he said quietly.

Hartnett got to his feet. For an instant he stood facing the gorilla-like form of our host; then he stepped over the sill, without a word. We passed down the unlighted corridor in silence, while Strange stood in the door of his study, watching us. I could not help but feel, as we left that gloomy house, that Strange had suddenly focused his entire attention upon me, and had ignored my companion. I could feel those eyes

upon me, and feel the force of the will behind them. A decided feeling of uneasiness crept over me, and I shuddered.

A moment later the big outer door had closed shut after us, and we were alone in Mate Lane. Alone, that is, until a third figure joined us in the shadows, and Drake's hand closed over my arm.

"Capital, Dale," he said triumphantly. "For half an hour you entertained him, you and Hartnett. And for half an hour I've had the unlimited freedom of his inner rooms, with the aid of an unlocked window on the lower floor. Those inner rooms, gentlemen, are significant—very!"

As we walked the length of Mate Lane, the gaunt, sinister home of Michael Strange became an indistinct outline in the pitch behind us. Drake said nothing more on the return trip, until we had nearly reached my rooms. Then he turned to me with a smile.

"We are one up on our friend, Dale," he said. "He does

not know, just now, which is the bigger fool—you or Hartnett here. However, I imagine Hartnett will be the victim of some very unusual events before many hours have passed!"

That was all. At least, all of significance. I left the two Scotland Yard men at the opening of Cheney Lane, and continued alone to my rooms. I opened the door and let myself in quietly. And there some few hours later, began the last and most horrible phase of the case of the murder machine.

It began—or to be more accurate, I began to react to it—at three o'clock in the morning. I was alone, and the rooms were dark. For hours I had sat quietly by the table, considering the significant events of the past few days. Sleep was impossible with so many unanswered questions staring into me, and so I sat there wondering.

Did Drake actually believe that Margot Vernee's simple story had been a ruse—that she had in truth killed her lover on that midnight intrusion of his home? Did he believe that Michael Strange knew of

that intrusion—that he had possibly planned it himself, and aided her, in order that Margot might be free to return to him? Did Strange know of that other intrusion, and of the uncanny power which had driven Sir John Harmon, and supposedly driven Margot to that house on After Street?

Those were the questions that still remained without answers: and it was over those questions that I pondered, while my surroundings became darker and more silent as the hour became more advanced. I heard the clock strike three, and heard the answering drone of Big Ben from the square.

And then it began. At first it was little more than a sense of nervousness. Before I had been content to sit in my chair and doze. Now, in spite of myself, I found myself pacing the floor, back and forth like a caged animal. I could have sworn, at the time, that some sinister presence had found entrance to my room. Yet the room was empty. And I could have sworn, too, that some silent power of will was commanding me, with undeniable force, to go out—out into the darkness of Cheney Lane.

I fought it bitterly. I laughed at it, yet even through my laugh came the memory of Sir John Harmon and Margot, and what they had told me. And then, unable to resist that unspoken demand, I seized my hat and coat and went out.

Cheney Lane was deserted, utterly still. At the end of it, the street lamp glowed dully, throwing a patch of ghastly light over the side of the adjoining building. I hurried through the shadows, and as I walked, a single idea had possession of me. I must hurry, I thought, with all possible speed, to that grim house in Mate Lane—number seven.

Where that deliberate desire came from I did not know. I did not stop to reason. Something had commanded me to go at once to Michael Strange's home. And though I stopped more than once, deliberately turning in my tracks, inevitably I was forced to retrace my steps and continue.

I remember passing through the square, and prowling through the unlightened side streets that lay beyond. Three miles separated Cheney Lane from Mate Lane,

and I had been over the route only once before, in a cab. Yet I followed that route without a single false turn, followed it instinctively. At every intersecting street I was dragged in a certain direction and not once was I allowed to hesitate. It was as though some unseen demon perched on my shoulders, as the demon of the sea rode Sinbad, and pointed out the way.

Only one disturbing thing occurred on that night journey through London. I had turned into a narrow street hardly more than a quarter mile from my destination; and before me, in the shadows, I made out the form of a shuffling old man. And here, as I watched him, I was conscious of a new, mad desire. I crept upon him stealthily, without a sound. My hands were outstretched, clutching, for his throat. At that moment I should have killed him!

I cannot explain it. During that brief interval I was a murderer at heart. I wanted to kill. And now that I remember it, the desire had been pregnant in me ever since the lights of Cheney Lane had died behind me. All the time that I prowled through those black

streets, murder lurked in my heart. I should have killed the first man who crossed my path.

But I did not kill him. Thank God, as my fingers twisted toward the back of his throat, that mad desire suddenly left me. I stood still, while the old fellow, still unsuspecting, shuffled, away into the darkness. Then, dropping my hands with a sob of helplessness, I went forward again.

And so I reached Mate Lane, and the huge gray house that awaited me. This time, as I mounted the stone steps, the old house seemed even more repulsive and horrible. I dreaded to see that door open, but I could not retreat.

I dropped the knocker heavily. A moment passed: and then, precisely as before, the huge door swung inward. Michael Strange stood before me.

He did not speak. Perhaps, if he had spoken, that fiendish spell would have been broken, and I should have returned, even then, to my own peaceful little rooms in Cheney Lane. No—he merely held the door

for me to enter, and as I passed him he stood there, watching me with a significant smile.

Straight to that familiar room at the end of the hall I went, with Strange behind me. When we had entered, he closed the door cautiously. For a moment he faced me without speaking.

"You came very close to committing a murder on your way here, did you not, Dale?"

I stared at him. How, in God's name, could this man read my thoughts so completely?

"You would have completed the murder," he said softly, "had I wished it. I did not wish it!"

I did not answer. There was no reply to such a mad declaration. As for my companion, he watched me for an instant and then laughed. He was not mad. I am doctor enough to know that.

But the laugh was not long in duration. He stepped forward suddenly and took my arm in a steel grip,

dragging me toward the half hidden door at the farther end of the room.

"I shall not keep you long, Dale," he said harshly. "I could have killed you—could have made you kill yourself, and in fact, I intended to do so—but after all, you are merely a poor stumbling fool who has meddled in things too deep for you."

He pulled open the door and pushed me forward. The room was dark, and not until he had closed the door again and switched on a dim light, could I see its contents.

Even then I saw nothing. At least, nothing of importance to an unscientific mind. There was a low table against the wall, with a profusion of tiny wires emanating from it. I was aware that a cup shaped microphone—or something very similar—hung over the table, about on a level with my eyes, had I been sitting in the chair. Beyond that I saw nothing, until Strange had moved forward and drawn aside a curtain that hung beside the table.

"I made you come here to-night, Dale," he murmured, "because I was a bit afraid of you. Your comrade, Hartnett, was an ignorant police officer. He has not the intellect to connect the series of events of the past day or two, and so I did not trouble myself with him. But you are an educated man. You have made no demonstrations of your ability in the field of science, but—"

He stopped speaking abruptly. From the room behind us came the sound of a warning bell. Strange turned quickly and went to the door.

"You will wait here, Doctor," he said. "I have another caller to-night. Another one who came the same way as you!"

He vanished. For a short interlude I was alone, with that peculiar radio-like apparatus before me. It was, for all the world, like a miniature control room in some small broadcasting station. Except for the odd shape of the microphone, if it was such I could detect no radical difference in equipment.

However, I had little time for conjecture. A patter of footsteps interrupted me from the next room, and a frightened, feminine voice broke the stillness of the outer study. Even before the owner of that voice stepped in to my presence, I knew her.

And when she came, with white, fearful face and trembling body, I could not withhold a shudder of apprehension. It was the young woman who had come to my office—Margot Vernee. Evidently, at last, she had yielded to the horrible impulse that had drawn her back to Michael Strange, an impulse which, I now understood, had originated from the man himself.

He pressed her forward. There was nothing tender in his touch: it was cruel and triumphant.

"So you have succeeded—at last," I said bitterly.

He turned to me with a sneer.

"I have brought her here, yes," he replied. "And now that she has come, she shall hear what I have to tell you. It will perhaps give her a respect for me, and this

time she will not have the power to turn me away."

He pointed to the table, to the apparatus that lay there.

"I'm telling you this, Dale," he said, "because it gives me pleasure to do so. You are enough of a scientist to appreciate and understand it. And if, when I have finished, I have told you too much, there is a very easy way to keep your tongue silent. You have heard of hypnotism, Dale? You have heard also of radio? Have you ever thought of combining the two?"

He faced me directly. I made no effort to reply.

"Radio," he said quietly, "is broadcast by means of sound waves. That much you know. But hypnotism too, can be transmitted through distance, if an instrument delicate enough to transmit *thought waves* can be invented. For twenty years I have worked on that instrument, and for twenty years I have studied hypnotism. You understand, of course, that this instrument is worthless unless it is operated by a master mind. Thought waves are useless; they will not

control the actions of even a cat. But hypnotic waves or concentrated thought waves—will control the world."

There was no denying him. He faced me with the savage triumph of a wild beast. He was glorying in his power, and in my amazement.

"I wanted Franklin White to die!" he cried. "It was I who murdered him. Why? Because he was about to take the girl I desired. Is that not reason enough for murder? And so I killed him. It was not Margot Vernee who strangled her lover: it was a complete stranger, a London sportsman, who had no reason for committing the murder, *except that I wished him to!*

"He died on the night of December seventh, murdered by Sir John Harmon, the sportsman. Why? Because, of all London, Sir John would be the last man to be suspected. I have a keen appreciation for the irony of fate! White would have died the night before, Dale, except that I lacked the courage to kill him. His murderer was standing, under my power, outside his very house—and then I suddenly thought it best that I

should have an alibi. Your Scotland Yard is clever, and it was best that I have protection. And so, on the following night, I sent Sir John to the house once again. This time, while I sat here and controlled the actions of my puppet, a group of men sat here with me. They believed that I was experimenting with a new type of radio receiver!"

Michael Strange laughed, laughed harshly, in utter triumph, as a cat laughs at the antics of his mouse victims.

"When that murder was done," he said, "I sent Margot to the scene, so that she might see her lover strangled, dead. I repeat, Dale, that I enjoy the irony of fate, especially when I can control it. And as for you—I brought you here to-night merely so that you would realize the intensity of the powers that control you. When you leave here, you will be unharmed—but after the exhibition I shall give you, I am sure that you will make no further attempt to interfere with things out of your realm of understanding."

I heard a sob from Margot. She had retreated to the

door, and clung there. For myself, I did not move. Strange's recital had revealed to me the horrible lust that gripped him, and now I watched him in fascination. He would not harm the girl; that much I was sure of. In his distorted fashion he loved her. In his crazed, murderous way he would attempt to win her love, even though she had once scorned him.

I saw him step toward the table. Saw him drop heavily into the chair, and stare directly into that microphonic thing that hung before his eyes. As he stared, he spoke to me.

"Science, in its intricate forms, is probably above the mind of a common medical man, Dale," he said. "It would be useless to explain to you how my thoughts—and my will—can be transmitted through space. Perhaps you have sat in a theater and stared at a certain person until that person turned to face you. You have? Then you will perhaps understand how I can control the minds of any human creature within the radius of my power. You see, Dale, this intricate little machine gives me the power to transform London into a city of stark murder. I could bring

about such a horrible wave of crime that Scotland Yard would be scorned from one end of the world to the other. I could make every man murder his neighbor, until the streets of the city were running with blood!"

Strange turned quietly to look at me. He spoke deliberately.

"And now for the little exhibition of which I spoke, Dale," he murmured. "Your detective friend, Hartnett, has been under my power for the past three hours. You see, it was safer to control his movements, and be sure of him. And now, to be doubly sure of him, perhaps you would like to see him kill himself!"

I stepped forward with a sudden cry. Strange said nothing: his eyes merely burned into mine. Once again I felt that strange, all-powerful control forcing me back. I retreated, step by step, until the wall stopped me. Yet even as I retreated, a childish hope filled me. How could Strange, working his terrible murder machine, concentrate his power on any individual, when the whole of London lay before him?

He answered my question. He must have read it as it came over me.

"Have you ever been in a crowd, Dale, and watched a certain individual intently, until that particular individual turned to look at you? The rest of the crowd pays no attention, of course, but that one man. And now we shall make that one man murder himself!"

Strange turned slowly. I saw his fingers creep along the rim of the table, touching certain wires that came together there. I heard a dull, droning hum fill the room, and, over it, Strange's penetrating voice.

"When I am finished, Dale, I shall probably kill you. I brought you here merely to frighten you, but I believe I have told you too much."

With that new horror upon me, I saw my captor's lips move slowly....

And then, from the shadows at the other end of the small room, came a low, unemotional voice.

"Before you begin, Strange—"

Michael Strange whipped about in his chair like a tiger. His hand dropped to his pocket, so swiftly that my eyes did not follow it. And as it dropped, a single staccato shot split the darkness of the room. The scientist slumped forward in his chair.

The dull, whirring sound of that hellish machine had stopped abruptly, cut short by the sudden weight of Strange's lunging body as he fell upon it. I saw the livid, fiery snake of white light twist suddenly upward through that coil of wires: and in another moment the entire apparatus shattered by a blinding crash of flame.

After that I turned away. Whether the bullet killed Strange or not, I do not know: but the sight of his charred face, hanging over that table of destruction, told its own story.

It was Inspector Drake who came across the room toward me, and took my arm. The smoking revolver still lay in his hand, and as he led me into the

adjoining room, I saw that Margot had already found refuge there.

"You see now, Dale," Drake said quietly, "why I let Hartnett go with you before? If Strange had suspected me, I should have been merely another victim. As for Hartnett, he has been under constant guard down at headquarters. He's safe. They've kept him there, at my instructions, in spite of all his terrific efforts to leave them."

I was listening to my companion in admiration. Even then I did not quite understand.

"I was wrong in just one thing, Dale. I left you alone, without protection. I believed Strange would ignore you, because, after all, you are not a Scotland Yard man. Thank God I had the sense to follow Margot—to trail her here—and get here soon enough."

And so ended the horrible series of events that began with Sir John Harmon's chance visit to my study. As for Harmon, he was later cleared of all guilt, upon the charred evidence in Michael Strange's house in Mate

Lane. The girl, I believe, has left London, where she can be as far as possible from memories that are all too terrible.

As for me, I am back once again in my quiet rooms in Cheney Lane, where the routine of common medical practice has wiped out many of those vivid horrors. In time, I believe, I shall forget, unless Inspector Drake, of Scotland Yard, insists upon bringing the affair up again!

October 1930

#51 Stolen Brains, By Sterner St. Paul Meek:

Dr. Bird, Scientific sleuth extraordinary, goes after a sinister stealer of brains.

Aproximate word count:

Bigotry:

Warnings:

and grasped the motionlessness

Dr. Bird, scientific sleuth extraordinary, goes after a sinister stealer of brains.

"I hope, Carnes," said Dr. Bird, "that we get good fishing."

"Good fishing? Will you please tell me what you are talking about?"

"I am talking about fishing, old dear. Have you seen the evening paper?"

"No. What's that got to do with it?"

Dr. Bird tossed across the table a copy of the *Washington Post* folded so as to bring uppermost an item on page three. Carnes saw his picture staring at him from the center of the page.

"What the dickens?" he exclaimed as he bent over the sheet. With growing astonishment he read that Operative Carnes of the United States Secret Service had collapsed at his desk that afternoon and had been rushed to Walter Reed Hospital where the trouble had

been diagnosed as a nervous breakdown caused by overwork. There followed a guarded statement from Admiral Clay, the President's personal physician, who had been called into conference by the army authorities.

The Admiral stated that the Chief of the Washington District was in no immediate danger but that a prolonged rest was necessary. The paper gave a glowing tribute to the detective's life and work and stated that he had been given sick leave for an indefinite period and that he was leaving at once for the fishing lodge of his friend, Dr. Bird of the Bureau of Standards, at Squapan Lake, Maine. Dr. Bird, the article concluded, would accompany and care for his stricken friend. Carnes laid aside the paper with a gasp.

"Do you know what all this means?" Carnes demanded.

"It means, Carnsey, old dear, that the fishing at Squapan Lake should be good right now and that I feel the need of accurate information on the subject. I

didn't want to go alone, so I engineered this outrage on the government and am taking you along for company. For the love of Mike, look sick from now on until we are clear of Washington. We leave to-night. I already have our tickets and reservations and all you have to do is to collect your tackle and pack your bags for a month or two in the woods and meet me at the Pennsy station at six to-night."

"And yet there are some people who say there is no Santa Claus," mused Carnes. "If I had really broken down from overwork, I would probably have had my pay docked for the time I was absent, but a man with official pull in this man's government wants to go fishing and presto! the wheels move and the way is clear. Doctor, I'll meet you as directed."

"Good enough," said Dr. Bird. "By the way, Carnes," he went on as the operative opened the door, "bring your pistol."

Carnes whirled about at the words.

"Are we going on a case?" he asked.

"That remains to be seen," replied the Doctor enigmatically. "At all events, bring your pistol. In answer to any questions, we are going fishing. In point of fact, we are—with ourselves as bait. If you have a little time to spare this afternoon you might drop around to the office of the *Post* and get them to show you all the amnesia cases they have had stories on during the past three months. They will be interesting reading. No more questions now, old dear, we'll have lots of time to talk things over while we are in the Maine woods."

Late the next evening they left the Bangor and Aroostook train at Mesardis and found a Ford truck waiting for them. Over a rough trail they were driven for fifteen miles, winding up at a log cabin which the Doctor announced was his. The truck deposited their belongings and jounced away and Dr. Bird led the way to the cabin, which proved to be unlocked. He pushed open the door and entered, followed by Carnes. The operative glanced at the occupants of the cabin and started back in surprise.

Seated at a table were two figures. The smaller of the

two had his back to the entrance but the larger one was facing them. He rose as they entered and Carnes rubbed his eyes and reeled weakly against the wall. Before him stood a replica of Dr. Bird. There was the same six feet two of bone and muscle, the same beetling brows and the same craggy chin and high forehead surmounted by a shock of unruly black hair. In face and figure the stranger was a replica of the famous scientist until he glanced at their hands. Dr. Bird's hands were long and slim with tapering fingers, the hands of a thinker and an artist despite the acid stains which disfigured them but could not hide their beauty. The hands of his double were stained as were Dr. Bird's, but they were short and thick and bespoke more the man of action than the man of thought.

The second figure arose and faced them and again Carnes received a shock. While the likeness was not so, striking, there was no doubt that the second man would have readily passed for Carnes himself in a dim light or at a little distance. Dr. Bird burst into laughter at the detective's puzzled face.

"Carnes," he said, "shake yourself together and then

shake hands with Major Trowbridge of the Coast Artillery Corps. It has been said by some people that we favor one another."

"I'm glad to meet you, Major," said Carnes. "The resemblance is positively uncanny. But for your hands, I would have trouble telling you two apart."

The Major glanced down at his stubby fingers.

"It is unfortunate but it can't be helped," he said. "Dr. Bird, this is Corporal Askins of my command. He is not as good a second to Mr. Carnes as I am to you but you said it was less important."

"The likeness is plenty good enough," replied the Doctor. "He will probably not be subjected to as close a scrutiny as you will. Did you have any trouble in getting here unobserved?"

"None at all, Doctor. Lieutenant Maynard found a good landing field within a half mile of here, as you said he would, and he has his Douglass camouflaged and is standing by. When do you expect trouble?"

"I have no idea. It may come to-night or it may come later. Personally I hope that it comes later so that we can get in a few days of fishing before anything happens."

"What do you expect to happen, Doctor?" demanded Carnes. "Every time I have asked you anything you told me to wait until we were in the Maine woods and we are there now. I read up everything that I could find on amnesia victims during the past three months but it didn't throw much light on the matter to me."

"How many cases did you find, Carnes?"

"Sixteen. There may have been lots more but I couldn't find any others in the *Post* records. Of course, unless the victim were a local man, or of some prominence, it wouldn't appear."

"You got most of them at that. Did any points of similarity strike you as you read them?"

"None except that all were prominent men and all of them mental workers of high caliber. That didn't

appear peculiar because it is the man of high mentality who is most apt to crack."

"Undoubtedly. There were some points of similarity which you missed. Where did the attacks take place?"

"Why, one was at—Thunder, Doctor! I did miss something. Every case, as nearly as I can recall, happened at some summer camp or other resort where they were on vacation."

"Correct. One other point. At what time of day did they occur?"

"In the morning, as well as I can remember. That point didn't register."

"They were all discovered in the morning, Carnes, which means that the actual loss of memory occurred during the night. Further, every case has happened within a circle with a diameter of three hundred miles. We are near the northern edge of that circle."

Carnes checked up on his memory rapidly.

"You're right, Doctor," he cried. "Do you think—?"

"Once in a while," replied Dr. Bird dryly, "I think enough to know the futility of guesses hazarded without complete data. We are now located within the limits of the amnesia belt and we are here to find out what did happen, if anything, and not to make wild guesses about it. You have the tent set up for us, Major?"

"Yes, Doctor, about thirty yards from the cabin and hidden so well that you could pass it a dozen times a day without suspecting its existence. The gas masks and other equipment which you sent to Fort Banks are in it."

"In that case we had better dispense with your company as soon as we have eaten a bite, and retire to it. On second thought, we will eat in it. Carnes, we will go to our downy couches at once and leave our substitutes in possession of the cabin. I trust, gentlemen, that things come out all right and that you are in no danger."

Major Trowbridge shrugged his heavy shoulders.

"It is as the gods will," he said sententiously. "It is merely a matter of duty to me, you know, and thank God, I have no family to mourn if anything does go wrong. Neither has Corporal Askins."

"Well, good luck at any rate. Will you guide Carnes to the tent and then return here and I'll join him?"

Huddled in the tiny concealed tent, Dr. Bird handed Carnes a haversack on a web strap.

"This is a gas mask," he said. "Put it on your neck and keep it ready for instant use. I have one on and one of us must wear a mask continually while we are here. We'll change off every hour. If the gas used is lethane, as I suspect, we should be able to detect it before its gets too concentrated, but some other gas might be used and we must take no chances. Now look here."

With the aid of a flash-light he showed Carnes a piece of apparatus which had been set up in the tent. It consisted of two telescopic barrels, one fitted with an

eye-piece and the other, which was at a wide angle to the first, with an objective glass. Between the two was a covered round disc from which projected a short tube fitted with a protecting lens. This tube was parallel to the telescopic barrel containing the objective lens.

"This is a new thing which I have developed and it is getting its first practical test to-night," he said. "It is a gas detector. It works on the principle of the spectroscope with modifications. From this projector goes out a beam of invisible light and the reflections are gathered and thrown through a prism of the eye-piece. While a spectroscope requires that the substance which it examines be incandescent and throw out visible light rays in order to show the typical spectral lines, this device catches the invisible ultra-violet on a fluorescent screen and analyzes it spectroscopically. Whoever has the mask on must continually search the sky with it and look for the three bright lines which characterize lethane, one at 230, one at 240 and the third at 670 on the illuminated scale. If you see any bright lines in those

regions or any other lines that are not continually present, call my attention to it at once. I'll watch for the first hour."

At the end of an hour Dr. Bird removed his mask with a sigh of relief and Carnes took his place at the spectroscope. For half an hour he moved the glass about and then spoke in a guarded tone.

"I don't see any of the lines you told me to look for," he said, "but in the southwest I get wide band at 310 and two lines at about 520."

Dr. Bird advanced toward the instrument but before he reached it, Carnes gave an exclamation.

"There they are, Doctor!" he cried.

Dr. Bird sniffed the air. A faint sweetish odor became apparent and he reached for his gas mask. Slowly his hands drooped and Carnes grasped him and drew the mask over his face. Dr. Bird rallied slightly and feebly drew a bottle from his pocket and sniffed it. In another instant he was shouldering Carnes aside and

staring through the spectroscope. Carnes watched him for an instant and then a low whirring noise attracted his attention and he looked up. Silently he caught the Doctor's arm in a viselike grip and pointed.

Hovering above the cabin was a silvery globe, faintly luminous in the moonlight. From its top rose a faint cloud of vapor which circled around the globe and descended toward the earth. The globe hovered like a giant humming bird above the cabin and Carnes barely stifled an exclamation. The door of the cabin opened and Major Trowbridge, walking stiffly and like a man in a dream, appeared. Slowly he advanced for ten yards and stood motionless. The globe moved over him and the bottom unfolded like a lily. Two long arms shot silently down and grasped the motionless figure and drew him up into the heart of the globe. The petals refolded, and silently as a dream the globe shot upward and disappeared.

"Gad! They lost no time!" commented Dr. Bird. "Come on, Carnes, run for your life, or rather, for Trowbridge's life. No, you idiot, leave your gas mask

on. I'll take the spectroscope; it'll be all we need."

Followed by the panting Carnes, Dr. Bird sped through the night along an almost invisible path. For half a mile he kept up a headlong pace until Carnes could feel his heart pounding as though it would burst his ribs. The pair debouched from the trees into a glade a few acres in extent and Dr. Bird paused and whistled softly. An answering whistle came from a few yards away and a figure rose in the darkness as they approached.

"Maynard?" called Dr. Bird. "Good enough! I was afraid that you might not have kept your gas mask on."

"My orders were to keep it on, sir," replied the lieutenant in muffled tones through his mask, "but my mechanician did not obey orders. He passed out cold without any warning about fifteen minutes ago."

"Where's your ship?"

"Right over here, sir."

"We'll take off at once. Your craft is equipped with a Bird silencer?"

"Yes, sir."

"Come on, Carnes, we're going to follow that globe. Take the front cockpit alone, Maynard; Carnes and I will get in the rear pit with the spec and guide you. You can take off your gas mask at an elevation of a thousand feet. You have pack 'chutes, haven't you?"

"In the rear pit, Doctor."

"Put one on, Carnes, and climb in. I've got to get this spec set up before he gets too high."

The Douglass equipped with the Bird silencer, took the air noiselessly and rapidly gained elevation under the urging of the pilot. Dr. Bird clamped the gas-detecting spectroscope on the front of his cockpit and peered through it.

"Southwest, at about a thousand more elevation," he directed.

"Right!" replied the pilot as he turned the nose of his plane in the indicated direction and began to climb. For an hour and a half the plane flew noiselessly through the night.

"Bald Mountain," said the pilot, pointing. "The Canadian Border is only a few miles away."

"If they've crossed the Border, we're sunk," replied the doctor. "The trail leads straight ahead."

For a few minutes they continued their flight toward the Canadian Border and then Dr. Bird spoke.

"Swing south," he directed, "and drop a thousand feet and come back."

The pilot executed the maneuver and Dr. Bird peered over the edge of the plane and directed the spectroscope toward the ground.

"Half a mile east," he said, "and drop another thousand. Carnes, get ready to jump when I give the word."

"Oh, Lord!" groaned Carnes as he fumbled for the rip cord of his parachute, "suppose this thing doesn't open?"

"They'll slide you between two barn doors for a coffin and bury you that way," said Dr. Bird grimly. "You know your orders, Maynard?"

"Yes, sir. When you drop, I am to land at the nearest town—it will be Lowell—and get in touch with the Commandant of the Portsmouth Navy Yard if possible. If I get him, I am to tell him my location and wait for the arrival of reinforcements. If I fail to get him on the telephone, I am to deliver a sealed packet which I carry to the nearest United States Marshal. When reinforcements arrive, either from the Navy Yard or from the Marshal, I am to guide them toward the spot where I dropped you and remain, as nearly as I can judge, two miles away until I get a further signal or orders from you."

"That is right. We'll be over the edge in another minute. Are you ready, Carnes?"

"Oh, yes, I'm ready, Doctor, if I have to risk my precious life in this contraption."

"Then jump!"

Side by side, Carnes and the doctor dropped toward the ground. The Douglass flew silently away into the night. Carnes found that the sensation of falling was not an unpleasant one as soon as he got accustomed to it. There was little sensation of motion, and it was not until a sharp whisper from Dr. Bird called it to his attention that he realized that he was almost to the ground. He bent his legs as he had been instructed and landed without any great jar. As he rose he saw that Dr. Bird was already on his feet and was eagerly searching the ground with the spectroscope which he had brought with him in the jump.

"Fold your parachute, Carnes, and we'll stow them away under a rock where they can't be seen. We won't use them again."

Carnes did so and deposited the silk bundle beside the doctor's, and they covered them with rocks until

they would be invisible from the air.

"Follow me," said the doctor as he strode carefully forward, stopping now and then to take a sight with the spectroscope. Carnes followed him as he made his way up a small hill which blocked the way. A hiss from Dr. Bird stopped him.

Dr. Bird had dropped flat on the ground, and Carnes, on all fours, crawled forward to join him. He smothered an exclamation as he looked over the crest of the hill. Before him, sitting in a hollow in the ground, was the huge globe which had spirited away Major Trowbridge.

"This is evidently their landing place," whispered Dr. Bird. "The next thing to find is their hiding place."

He rose and started forward but sank at once to the ground and dragged Carnes down with him. On the hill which formed the opposite side of the hollow a line of light showed for an instant as though a door had been opened. The light disappeared and then reappeared, and as they watched it widened and

against an illuminated background four men appeared, carrying a fifth. The door shut behind them and they made their way slowly toward the waiting globe. They laid down their burden and one of them turned a flash-light on the globe and opened a door in its side through which they hoisted their burden. They all entered the globe, the door closed and with a slight whirring sound it rose in the air and moved rapidly toward the northeast.

"That's the place we're looking for," muttered Dr. Bird. "We'll go around this hollow and look for it. Be careful where you step; they must have ventilation somewhere if their laboratory is underground."

Followed by the secret service operative, the doctor made his way along the edge of the hollow. They did not dare to show a light and it was slow work feeling their way forward, inch by inch. When they had reached a point above where the doctor thought the light had been he paused.

"There must be a ventilation shaft somewhere around here," he whispered, his mouth not an inch from

Carnes' ear, "and we've got to find it. It would never do to try the door; if any of them are still here it is sure to be guarded. You go up the hill for five yards and I'll go down. Quarter back and forth on a two hundred yard front and work carefully. Don't fall in, whatever you do. We'll return to this point every time we pass it and report."

The operative nodded and walked a few yards up the hill and made his way slowly forward. He went a hundred yards as nearly as he could judge and then stepped five yards further up the hill and made his way back. As he passed the starting point he approached and Dr. Bird's figure rose up.

"Any luck?" he whispered.

Dr. Bird shook his head.

"Well try further," he said. "I think it is probably beyond us, so suppose you go fifteen yards up and quarter the same as before."

Carnes nodded and stole silently away. Fifteen yards

up the hill he went and then paused. He stood on the crest of the hill and before him was a steep, almost precipitous slope. He made his way along the edge for a few yards and then paused. Faintly he could detect a murmur of voices. Inch by inch he crept forward, going over the ground under foot. He paused and listened intently and decided that the sound must come from the slope beneath him. A glance at his watch told him that he had spent ten minutes on this trip and he made his way back to the meeting place.

Dr. Bird was waiting for him, and in a low whisper Carnes reported his discovery. The doctor went back with him and together they renewed the search. The slope of the hill was almost sheer and Carnes looked dubiously over the edge.

"I wish we had brought the parachutes," he whispered to the doctor. "We could have taken the ropes off them and you could have lowered me over the edge."

Dr. Bird chuckled softly and tugged at his middle. Carnes watched him with astonishment in the dim

light, but he understood when Dr. Bird thrust the end of a strong but light silk cord into his hands. He looped it under his arms and the doctor with whispered instructions, lowered him over the cliff. The doctor lowered him for a few feet and then stopped in response to a jerk on the free end. A moment later Carnes signaled to be drawn up and soon stood beside the doctor.

"That's the place all right," he whispered. "The whole cliff is covered with creepers and there is a tree growing right close to it. If we can anchor the cord here, I think that we can slide down to a safe hold on the tree."

A tree stood near and the silk cord was soon fastened. Carnes disappeared over the cliff and in a few moments Dr. Bird slid down the cord to join him. He found the detective seated in the crotch of a tree only a few feet from the face of the cliff. From the cliff came a pronounced murmur of voices. Dr. Bird drew in his breath in excitement and moved forward along the branch. He touched the stone and after a moment of searching he cautiously raised one corner of a

painted canvas flap and peered into the cliff. He watched for a few seconds and then slid back and silently pulled Carnes toward him.

Together the two men made their way toward the cliff and Dr. Bird raised the corner of the flap and they peered into the hill. Before them was a cave fitted up as a cross between a laboratory and a hospital.

Almost directly opposite them and at the left of a door in the farther wall was a ray machine of some sort. It was a puzzle to Carnes, and even Dr. Bird, although he could grasp the principle at a glance, was at a loss to divine its use. From a set of coils attached to a generator was connected a tube of the Crookes tube type with the rays from it gathered and thrown by a parabolic reflector onto the space where a man's head would rest when he was seated in a white metal chair with rubber insulated feet, which stood beneath it. An operating table occupied the other side of the room while a gas cylinder and other common hospital apparatus stood around ready for use.

Seated at a table which occupied the center of the room were three men. The sound of their voices rose

from an indistinct murmur to audibility as the flap was raised and the watchers could readily understand their words. Two of them sat with their faces toward the main entrance and the third man faced them. Carnes bit his lip as he looked at the man at the head of the table. He was twisted and misshapen in body, a grotesque dwarf with a hunched back, not over four feet in height. His massive head, sunken between his hunched shoulders, showed a tremendous dome of cranium and a brow wider and even higher than Dr. Bird's. The rest of his face was lined and drawn as though by years of acute suffering. Sharp black eyes glared brightly from deep sunk caverns. The dwarf was entirely bald; even the bushy eyebrows which would be expected from his face, were missing.

"They ought to be getting back," said the dwarf sharply.

"If they get back at all," said one of the two figures facing him.

"What do you mean?" growled the dwarf, his eyes glittering ominously. "They'll return all right; they

know they'd better."

"They'll return if they can, but I tell you again, Slavatsky, I think it was a piece of foolishness to try to take two men in one night. We got Bird all right, but it is getting late for a second one, and they had to take Bird over a hundred miles and then go nearly three hundred more for Williams. The news about Bird may have been discovered and spread and others may be looking out for us. Carnes might have recovered."

"Didn't he get a full dose of lethane?"

"So Frick says, and Bird certainly had a full dose, but I can't help but feel uneasy. Our operations were going too nicely on schedule and you had to break it up and take on an extra case in the same night as a scheduled one. I tell you, I don't like it."

"I'm sorry that I did it, Carson, but only because the results were so poor. We had planned on Williams for a month and I wanted him. And Bird was so easy that I couldn't resist it."

"And what did you get? Not as much menthium as would have come from an ordinary bookkeeper."

"I'll admit that Bird is a grossly overrated man. He must have worked in sheer luck in his work in the past, for there was nothing in his brain to show it above average. We got barely enough menthium to replace what we used in capturing him."

"We ought to have taken Carnes and left Bird alone," snorted Carson. "Even a wooden-headed detective ought to have given us a better supply than Bird yielded."

"We are bound to meet with disappointments once in a while. I had marked Bird down long ago as soon as I could get a chance at him."

"Well, you ran that show, Slavatsky, but I'll warn you that we aren't going to let you pull off another one like it. I take no more crazy chances, even on your orders."

The hunchback rose to his feet, his eyes glittering

ominously.

"What do you mean, Carson?" he asked slowly, his hand slipping behind him as he spoke.

"Don't try any rough stuff, Slavatsky!" warned Carson sharply. "I can pull a tube as fast as you can, and I'll do it if I have to."

"Gentlemen, gentlemen!" protested the third man rising, "we are all too deep in this to quarrel. Sit down and let's talk this over. Carson is just worried."

"What is there to be worried about?" grunted the dwarf as he slid back into his chair. "Everything has gone nicely so far and no suspicion has been raised."

"Maybe it has and then again maybe it hasn't," growled Carson. "I think this Bird episode to-night looks bad. In the first place, it came too opportunely and too easily. In the second place Bird should have yielded more menthium, and in the third place, did you notice his hands? They weren't the type of hands to expect on a man of his type."

"Nonsense, they were acid stained."

"Acid stains can be put on. It may be all right, but I am worried. While we are talking about this matter, there is another thing I want cleared up."

"What is it?"

"I think, Slavatsky, that you are holding out on us. You are getting more than your share of the menthium."

Again the dwarf leaped to his feet, but the peace-maker intervened.

"Carson has a right to look at the records, Slavatsky," he said. "I am satisfied, but I'd like to look at them, too. None of us have seen them for two months."

The dwarf glared at first one and then the other.

"All right," he said shortly and limped to a cabinet on the wall. He drew a key from his pocket and opened it and pulled out a leather-bound book. "Look all you please. I was supposed to get the most. It was my

idea."

"You were to get one share and a half, while Willis, Frink and I got one share each and the rest half a share," said Carson. "I know how much has been given and it won't take me but a minute to check up."

He bent over the book, but Willis interrupted.

"Better put it away, Carson," he said, "here come the rest and we don't want them to know we suspect anything."

He pointed toward a disc on the wall which had begun to glow. Slavatsky looked at it and grasped the book from Carson and replaced it in the cabinet. He moved over and started the generator and the tube began to glow with a violet light. A noise came from the outside and the door opened. Four men entered carrying a fifth whom they propped up in the chair under the glowing tube.

"Did everything go all right?" asked the dwarf eagerly.

"Smooth as silk," replied one of the four. "I hope we get some results this time."

The dwarf bent over the ray apparatus and made some adjustments and the head of the unconscious man was bathed with a violet glow. For three minutes the flood of light poured on his head and then the dwarf shut off the light and Carson and Willis lifted the figure and laid it on the operating table. The dwarf bent over the man and inserted the needle of a hypodermic syringe into the back of the neck at the base of the brain. The needle was an extremely long one, and Dr. Bird gasped as he saw four inches of shining steel buried in the brain of the unconscious man.

Slowly Slavatsky drew back the plunger of the syringe and Dr. Bird could see it was being filled with an amber fluid. For two minutes the slow work continued, until a speck of red appeared in the glass syringe barrel.

"Seven and a half cubic centimeters!" cried the dwarf in a tone of delight.

"Fine!" cried Carson. "That's a record, isn't it?"

"No, we got eight once. Now hold him carefully while I return some of it."

Slavatsky slowly pressed home the plunger and a portion of the amber fluid was returned to the patient's skull. Presently he withdrew the needle and straightened up and held it toward the light.

"Six centimeters net," he announced. "Take him back, Frink. I'll give Carson and Willis their share now and we'll take care of the rest of you when you return. Is the ship well stocked?"

"Enough for two or three more trips."

"In that case, I'll inject this whole lot. Better get going, Frink, it's pretty late."

The four men who had brought the patient in stepped forward and lifted him from the table and bore him out. Dr. Bird dropped the canvas screen and strained his ears. A faint whir told him that the globe had

taken to the air. He slid back along the limb of the tree until he touched the rope and silently climbed hand over hand until he gained the crest. He bent his back to the task of raising Carnes, and the operative soon stood beside him on the ledge surmounting the cliff.

"What on earth were they doing?" asked Carnes in a whisper.

"That was Professor Williams of Yale. They were depriving him of his memory. There will be another amnesia case in the papers to-morrow. I haven't time to explain their methods now: we've got to act. You have a flash-light?"

"Yes, and my gun. Shall we break in? There are only three of them, and I think we could handle the lot."

"Yes, but the others may return at any time and we want to bag the whole lot. They've done their damage for to-night. You heard my orders to Lieutenant Maynard, didn't you?"

"Yes."

"He should be somewhere in these hills to the south with assistance of some sort. The signal to them is three long flashes followed in turn by three short ones and three more long. Go and find them and bring them here. When you get close give me the same light signal and don't try to break in unless I am with you. I am going to reconnoitre a little more and make sure that there is no back entrance through which they can escape. Good luck. Carnes: hurry all you can. There is no time to be lost."

The secret service operative stole away into the night and Dr. Bird climbed back down the rope and took his place at the window. Willis lay on the operating table unconscious, while Slavatsky and Carson studied the now partially emptied syringe.

"You gave him his full share all right," Carson was saying. "I guess you are playing square with us. I'll take mine now."

He lay down on the operating table and the dwarf

fitted an anesthesia cone over his face and opened the valve of the gas cylinder. In a moment he closed it and rolled the unconscious man on his face and deftly inserted the long needle. Instead of injecting a portion of the contents of the syringe as Dr. Bird had expected to do, he drew back on the plunger for a minute and then took out the needle and held the syringe to the light.

"Well, Mr. Carson," he said with a malignant glance at the unconscious figure, "that recovers the dose you got a couple of weeks ago while Willis watched me. I don't think you really need any menthium; your brain is too active to suit me as it is."

He gave an evil chuckle and walked to the far side of the cave and opened a secret panel. He drew from a recess a flask and carefully emptied a portion of the contents of the syringe into it. He replaced the flask and closed the panel, and with another chuckle he limped over to a chair and threw himself down in it. For an hour he sat motionless and Dr. Bird carefully worked his way back along the branch and climbed the rope and started for the hollow.

A faint whirring noise attracted his attention, and he could see the faintly luminous globe in the distance, rapidly approaching. It came to a stop at the spot where it had previously landed and four men got out. Instead of going toward the cave, they towed the globe, which floated a few inches from the earth, toward the side of the hill farthest from where the doctor stood. Three of them held it, while the fourth went forward and bent over some controls on the ground. A creaking sound came through the night and the men moved forward with the globe. Presently its movement stopped and men reappeared. Again came the creaking sound and the glow faded out as though a screen had been drawn in front of it. The four men walked toward the door of the cave.

Dr. Bird dropped flat on the ground and saw them pause a few yards below him on the hill and again work some hidden controls. A glare of light showed for an instant and they disappeared and everything was again quiet. Dr. Bird debated the advisability of returning to the window but decided against it and moved down the face of the hill.

Inch by inch he went over the ground, but found nothing. In the darkness he could not locate the door and he made his way around to the back of the hill. The precipice loomed above him and he swept it with his gaze, but he could locate no opening in the darkness and he dared not use a flash-light. As he turned he faced the east and noted with a start of surprise that the sky was getting red. He glanced at his watch and found that Carnes had been gone for nearly three hours.

"Great Scott!" he exclaimed in surprise. "Time has gone faster than I realized. He ought to be back at any time now."

He mounted the highest point of the hill and sent three long flashes, followed in turn by three short and three more long to the south and watched eagerly for an answer. He waited five minutes and repeated the signal, but no answering flashes came from the empty hills. With a grunt which might have meant anything, he turned and made his way toward the opposite side of the hollow where the globe had disappeared. Here he met with more luck. He had marked the location

with extreme care and he had not spent over twenty minutes feeling over the ground before his hand encountered a bit of metal. As he pulled on it his eyes sought the side of the hill.

The dawn had grown sufficiently bright for him to see the result of his action. A portion of the hill folded back and the faintly glowing ship became visible. With a muttered exclamation of triumph he approached it.

The globe was about nine feet in diameter and was without visible doors or windows. Around and around it the doctor went, searching for an entrance. The ship now rested solidly on the ground. He failed to find what he sought and his sensitive hands began to go over it searching for an irregularity. He had covered nearly half of it before his finger found a hidden button and pressed it. Silently a door in the side of the craft opened and he advanced to enter.

"Keep them up!" said a sharp voice behind him.

Dr. Bird froze into instant immobility and the voice

spoke again.

"Turn around!"

Dr. Bird turned and looked full into the eye of a revolver held by the man the dwarf had addressed as Frink. Behind Frink stood the dwarf and three other men.

As his eye fell on Dr. Bird, Frink turned momentarily pale and staggered back, the revolver wavering as he did so. Dr. Bird made a lightning-like grab for his own weapon, but before he could draw it Frink had recovered and the revolver was again steady.

"Dr. Bird!" gasped Slavatsky. "Impossible!"

"Get his gun, Harris," said Frink.

One of the men stepped forward and dextrously removed the doctor's automatic and frisked him expertly to insure himself that he had no other weapon concealed.

"Bring him to the cave," directed Slavatsky, who, though obviously still shaken, had just as obviously recovered enough to be a very dangerous man. Two of the men grasped the doctor and led him along toward the entrance to the laboratory cave which stood wide open in the gathering daylight. Frink paused long enough to shut the side of the hill and conceal the ship, and then followed the doctor. In the cave the door was shut and the doctor placed against the wall under the window through which he had peered earlier in the night. Slavatsky took his seat at the table, his malignant black eyes boring into the Doctor. Carson and Willis sat on the edge of the operating table, evidently still partially under the effects of the anesthetic that had been administered to them.

"How did you get back here?" demanded Slavatsky.

"Find out!" snapped Dr. Bird.

The dwarf rose threateningly.

"Speak respectfully to me; I am the Master of the World!" he roared in an angry voice. "Answer my

questions when I speak, or means will be found to make you answer. How did you get back here?"

Dr. Bird maintained a stubborn silence, his fierce eyes answering the dwarf's, look for look, and his prominent chin jutting out a little more squarely. Carson suddenly broke the silence.

"That's not the Bird we had here earlier," he cried as he staggered to his feet.

"What do you mean?" demanded Slavatsky whirling on him.

"Look at his hands!" replied Carson pointing.

Slavatsky looked at Dr. Bird's long mobile fingers and an evil leer came over his countenance.

"So, Dr. Bird," he said slowly, "you thought to match wits with Ivan Slavatsky, the greatest mind of all the ages. For a time you fooled me when your double was operated on here, but not for long. I presume you thought that we had no way of detecting the

substitution? You have discovered differently. Where is your friend, Mr. Carnes?"

"Didn't your men leave him in the cabin when you kidnapped me?"

Slavatsky looked at Frink inquiringly.

"He stayed in the cabin if he was in it when we got there," the leader of the kidnapping gang replied. "He got a full shot of lethane and he's due to be asleep yet. I don't know how this man recovered. I left him there myself."

"Fool!" shrieked Slavatsky. "You brought me a double, a dummy whom I wasted my time in operating on. Was the other a dummy, too?"

"I didn't enter the cabin."

Slavatsky shrugged his shoulders.

"If that is all the good the menthium I have injected has done you, I might as well have saved it. It doesn't

matter, however: we have the one we wanted. Dr. Bird, it was very thoughtful of you to come here and offer your marvelous brain to strengthen mine. I have no doubt that you will yield even more menthium than Professor Williams did this evening especially as I will extract your entire supply and reduce you to permanent idiocy. I will have no mercy on you as I have on the others I have operated on."

Dr. Bird blanched in spite of himself at the ominous words.

"You have the whip-hand for the moment, Slavatsky, but my time may come—and if it does, I will remember your kindness. I saw your operation on Professor Williams this evening and know your power. I also know that you stole the idea and the method from Sweigert of Vienna. I saw you inject the fluid you drew into Willis' brain. Shall I tell what else I saw?"

It was the dwarf's turn to blanch, but he recovered himself quickly.

"Into the chair with him!" he roared.

Three of the men grasped the doctor and forced him into the chair and Slavatsky started the generator. The violet light bathed Dr. Bird's head and he felt a stiffness and contraction of his neck muscles, and as he tried to shout out his knowledge of Slavatsky's treachery, he found that his vocal chords were paralyzed. Through a gathering haze he could see Carson approaching with an anesthesia cone and the sweet smell of lethane assailed his nostrils. He fought with all his force, but strong hands held him, and he felt himself slipping—slipping—slipping—and then falling into an immense void. His head slumped forward on his chest and Slavatsky shut off the generator.

"On the table," he said briefly.

Four men picked up the herculean frame of the unconscious doctor and hoisted him up on the table. Carson seized his head and bent it forward and the dwarf took from a case a syringe with a five-inch needle. He touched the point of it to the base of the doctor's brain.

"Slavatsky! Look!" cried Frink.

With an exclamation of impatience the dwarf turned and stared at a disc set on the wall of the cave. It was glowing brightly. With an oath he dropped the syringe and snapped a switch, plunging the cave into darkness. A tiny panel in the door opened to his touch and he stared out into the light.

"Soldiers!" he gasped. "Quick, the back way!"

As he spoke there came a sound as of a heavy body falling at the back of the cave. Slavatsky turned the switch and flooded the cave with light. At the back of the cave stood Operative Carnes, an automatic pistol in his hand.

"Open the main door!" Carnes snapped.

Slavatsky made a move toward the light, and Carnes' gun roared deafeningly in the confined space. The heavy bullet smashed into the wall an inch from the dwarf's hand and he started back.

"Open the main door!" ordered Carnes again.

The men stared at one another for a moment and the dwarf's eyes fell.

"Open the door, Frink," he said.

Frink moved over to a lever. He glanced at Slavatsky and a momentary gleam of intelligence passed between them. Frink raised his hand toward the lever and Carnes gun roared again and Frink's arm fell limp from a smashed shoulder.

"Slavatsky," said Carnes sternly, "come here!"

Slowly the dwarf approached.

"Turn around!" said Carnes.

He turned and felt the cold muzzle of Carnes' gun against the back of his neck.

"Now tell one of your men to open the door," said the detective. "If he promptly obeys your order, you are

safe. If he doesn't, you die."

Slavatsky hesitated for a moment, but the cold muzzle of the automatic bored into the back of his neck and when he spoke it was in a quavering whine.

"Open the door, Carson," he whimpered.

There was moment of pause.

"If that door isn't open by the time I count three," said Carnes, "—as far as Slavatsky is concerned, it's just too bad. I'll have four shots left—and I'm a dead shot at this range. One! Two!"

His lips framed the word "three" and his fingers were tightening on the trigger when Carson jumped forward with an oath. He pulled a lever on the wall and the door swung open. Carnes shouted and through the opened door came a half dozen marines followed by an officer.

"Tie these men up!" snapped Carnes.

In a trice the six men were securely bound and Frink's bleeding shoulder was being skilfully treated by two of the marines. Carnes turned his attention to the unconscious doctor.

He rolled him over on his back and began to chafe his hands. An officer in a naval uniform came through the door and with a swift glance around, bent over Dr. Bird. He raised one of the doctor's eyelids and peered closely at his eye and then sniffed at his breath.

"It's some anesthetic I don't know," he said. "I'll try a stimulant."

He reached in his pocket for a hypodermic, but Carnes interrupted him.

"Earlier in the evening Dr. Bird said they were using lethane," he said.

"Oh, that new gas the Chemical Warfare Service has discovered," said the surgeon. "In that case I guess it'll just have to wear off. I know of nothing that will neutralize it."

Without replying, Carnes began to feverishly search the pockets of the unconscious scientist. With an exclamation of triumph he drew out a bottle and uncorked it. A strong smell as of garlic penetrated the room and he held the opened bottle under Dr. Bird's nose. The doctor lay for a moment without movement, and then he coughed and sat up half strangled with tears running down his face.

"Take that confounded bottle away, Carnes!" he said.
"Do you want to strangle me?"

He sat up and looked around.

"What happened?" he demanded. "Oh, yes, I remember now. That brute was about to operate on me. How did you get here?"

"Never mind that, Doctor. Are you all right?"

"Right as a trivet, old dear. How did you get here so opportunely?"

"I was a little slow in locating Lieutenant Maynard

and the marines. When we got here I was afraid that we couldn't find the door, so I took Maynard and a detail around to the back and I went up to the top and slid down our cord and looked in the window. You were unconscious and Slavatsky was bending over you with a needle in his hand. I was about to try a shot at him when something called their attention to the men in front and I squeezed through the window and dropped in on them. They didn't seem any too glad to see me, but I overlooked that and insisted on inviting the rest of my friends in to share in the party. That's all."

"Carnes," said the Doctor, "you're probably lying like a trooper when you make out that you did nothing, but I'll pry the truth out of you sooner or later. Now I've got to get to work. Send for Lieutenant Maynard."

One of the marines went out to get the flyer, and Dr. Bird stepped to the cabinet from which Slavatsky had taken his record book earlier in the evening and took out the leather-bound volume. He opened it and had started to read when Lieutenant Maynard entered the cave.

"Hello, Maynard," said the Doctor, looking up. "Are the rest of the party on their way?"

"They will be here in less than two hours, Doctor."

"Good enough! Have some one sent to guide them here. In the meanwhile, I'm going to study these records. Keep the prisoners quiet. If they make a noise, gag them. I want to concentrate."

For an hour and a half silence reigned in the cave. A stir was heard outside and Admiral Clay, the President's personal physician, entered leading a stout gray-haired man. Dr. Bird whistled when he saw them and leaped to his feet as another figure followed the admiral.

"The President!" gasped Carnes as the officers came to a salute and the marines presented arms.

The President nodded to his ex-guard, acknowledged the salute of the rest and turned to Dr. Bird.

"Have you met with success, Doctor?" he asked.

"I have, Mr. President; or, rather, I hope that I have. At the same time, I would rather experiment on some other victim of their deviltry than the one you have brought me."

"My decision that the one I have brought shall be the first to be experimented on, as you term it, is unalterable."

Dr. Bird bowed and turned to the dwarf who had been a sullen witness of what had gone on.

"Slavatsky," he said slowly, "your game is up. I have witnessed one of your brain transfusions and I know the method. I gather from your notes that the menthium you have hidden in that cabinet is still as potent as when it was first extracted from a living brain, but in this case I am going to draw it fresh from one of your gang. Some of the details of the operation are a little hazy to me, but those you will teach me. I am going to restore this man to the condition he was in before you did your devil's work on him and you will direct my movements. Just what is the first step in removing the menthium from a brain?"

The dwarf maintained a stubborn silence.

"You refuse to answer?" asked the Doctor in feigned surprise. "I thought that you would rather instruct me and have me try the operation first on other men. Since you prefer that I operate on you first, I will be glad to do so."

He stepped to the opposite wall and in a few moments had opened the dwarf's hiding place and taken out the flask of menthium.

"Carson," he said, "after you had watched Slavatsky inject menthium into Willis, you took lethane and expected him to inject menthium into your brain. Instead of doing so he withdrew a portion from your brain and put it in this flask. I have reason to believe from his secret records which I found in the cabinet with this flask that he has done so regularly. Are you willing to instruct me while I remove the menthium from him?"

"The dirty swine!" shouted Carson. "I'll do anything to get even with him, but I have never performed the

operation. Only Slavatsky and Willis have operated."

"Will you help me, Willis? asked Dr. Bird.

"I'll be glad to, Doctor. I am sick of this business anyway. At first, Slavatsky just planned to give us abnormally keen brains, but lately he has been talking of setting himself up as Emperor of the World, and I am sick of it. I think I would have broken with him and told all I know, soon, anyway."

"Throw him in that chair," said Dr. Bird.

Despite the howlings and strugglings of the dwarf, three of the marines strapped him in the chair beneath the tube. The dwarf howled and frothed at the mouth and directed a final appeal for mercy to the President.

"Spare me, Your Excellency," he howled. "I will put my brains at your service and make you the greatest mentality of all time. Together we can conquer and rule the world. I will show you how to build hundreds of ships like mine—"

The President turned his back on the dwarf and spoke curtly.

"Proceed with your experiments, Dr. Bird," he said.

Slavatsky directed his appeals to the doctor, who peremptorily silenced him.

"I told you a few hours ago, Slavatsky, that the time might come when I would remember your threats against me. I will show you the same mercy now as you promised me then. Carnes, put a cone over his face."

Despite the howls of the dwarf, the operative forced an anesthesia cone over his face and Dr. Bird turned to the valve of the lethane cylinder. With Willis directing his movements, he turned on the ray for three minutes and removed the unconscious dwarf to the operating table. He took the long-needed syringe from a case and sterilized it and then turned to the President.

"I am about to operate," he said, "but before I do so, I

wish to explain to all just what I have learned and what I am about to do. With that data, the decision of whether I shall proceed will rest with you and Admiral Clay. Have I your permission to do so?"

The President nodded.

"When I first read of these amnesia cases, I took them for coincidences—until you consulted me and gave me an opportunity to examine one of the victims. I found a small puncture at the base of the brain which I could not explain, and I began to dig into old records. I knew, of course, of Sweigert of Vienna, and the extravagant claims he had put forward in 1911. He was far ahead of his time, but he mixed up some profound scientific discoveries with mysticism and occultism until he was discredited. Nevertheless, he continued his experiments with the aid of his principal assistant, a man named Slavatsky.

"Sweigert's theory was that intellectuality, brain power, intelligence, call it what you will, was the result of the presence of a fluid which he called 'menthium' in the brain. He thought that it could be

transferred from one person to another, and with the aid of Slavatsky, he experimented on himself. He removed the menthium from an unfortunate victim, who was reduced to a state of imbecility, and Slavatsky injected the substance into Sweigert's brain. The experiment resulted fatally and Slavatsky was tried for murder. He was acquitted of intentional murder but was imprisoned for a time for manslaughter. He was released when the Austro-Hungarian Empire was broken up, and for a time I lost track of him.

"I found translations of both the records of the trials and of Sweigert's original reports, and the thing that attracted my attention was that the puncture I found in the victim corresponded exactly with the puncture described by Sweigert as the one he made in extracting the menthium. I asked the immigration authorities to check over their records and they found that a man named Slavatsky whose description corresponded with the ill-fated Sweigert's assistant had entered the United States under Austria's quota about a year ago. The chain of evidence seemed

complete to me, and it only remained to find the man who was systematically robbing brains.

"If such a thing was really going on, I felt that my reputation would make me an attractive bait and I secured a double, as you know, and placed him in a position where his kidnapping would be an easy matter. I was sure that the victims were being taken away by air and that lethane was being used to reduce the neighborhood to a state of profound somnolence, so I hid myself near my double with a gas detector which would find even minute traces of lethane in the air.

"My fish rose to the lure and came after the bait last night. When his ship arrived, I found a strange gas in the air, and followed the ship by the trail of the substance which it left behind it. Carnes was with me, and we got here in time to witness the extraction of the menthium from my friend, Professor Williams of Yale, and to see it injected into one of Slavatsky's gang. I sent Carnes for help and messed around until I was captured myself—and help arrived just in time. That's about all there is to tell. I am now about to

reverse the process and try to remove the stolen brains from the criminals and restore them to their rightful owners. I have never operated and the result may be fatal. Shall I proceed?"

The President and Admiral Clay consulted for a moment in undertones.

"Go on with your experiments, Dr. Bird," said the President, "and we will hold you blameless for a failure. You have worked so many miracles in the past that we have every confidence in you."

Dr. Bird bowed acknowledgment to the compliment and bent over the unconscious dwarf. With Willis directing every move, he inserted the needle and drew back slowly on the plunger. Twenty-three and one-half cubic centimeters of amber fluid flowed into the syringe before a speck of blood appeared.

"Enough!" cried Willis. Dr. Bird withdrew the syringe and motioned to Admiral Clay. The man the Admiral had brought in was placed in the chair and lethane administered. He was laid on the table, and, with a

silent prayer, Dr. Bird inserted the needle and pressed the plunger. When five and one-quarter centimeters had flowed into the man's brains, he withdrew the needle and held the bottle which Carnes had used to revive him under the man's nose. The patient coughed a moment and sat up.

"Where am I?" he demanded. His gaze roved the cave and fell on the President. "Hello, Robert," he exclaimed. "What has happened?"

With a cry of joy the President sprang forward and wrung the hand of the man.

"Are you all right, William?" he asked anxiously. "Do you feel perfectly normal?"

"Of course I do. My neck feels a little stiff. What are you talking about? Why shouldn't I feel normal? How did I get here?"

"Take him outside, Admiral, and explain to him," said the President.

Admiral Clay led the puzzled man outside and the President turned to Dr. Bird.

"Doctor," he said, "I need not tell you that I again add my personal gratitude to the gratitude of a nation which would be yours, could the miracles you work be told off. If there is ever any way that can serve you, either personally or officially, do not hesitate to ask. The other victims will be brought here to-day. Will you be able to restore them?"

"I will, Mr. President. From Slavatsky's records I find that I will have enough if I reduce all of his men to a state of imbecility except Willis. In view of his assistance, I propose to leave him with enough menthium to give him the intelligence of an ordinary schoolboy."

"I quite approve of that," said the President as Willis humbly expressed his gratitude. "Have you had time to make an examination of that ship of Slavatsky's, yet?"

"I have not. As soon as the work of restoration is

completed, I will go over it, and when I master the principles I will be glad to take them up with the Army-Navy General Board."

"Thank you, Doctor," said the President. He shook hands heartily and left the cave. Carnes turned and looked at the Doctor.

"Will you answer a question, Doctor?" he asked. "Ever since this case started, I have been wondering at your extraordinary powers. You have ordered the army, the navy, the department of justice and everyone else around as though you were an absolute monarch. I know the President was behind you, but what puzzles me is how he came to be so vitally interested in the case."

Dr. Bird smiled quizzically at the detective.

"Even the secret service doesn't know everything," he said. "Evidently you didn't recognize the man whose memory I restored. Besides being one of the most brilliant corporation executives in the country, he has another unique distinction. He happens to be the only

brother of the President of the United States."

Chapter 1: *Out of the Hangman's Hands*

"You speak," said Von Kettler, jeering, "as if you really believed that you had the power of life and death over me."

With night-rays and darkness-antidote America strikes back at the terrific and destructive Invisible Empire.

The Superintendent of the penitentiary frowned, yet there was something of perplexity in the look he gave the prisoner. "Von Kettler, I think it is time that you dropped this absurd pose of yours," he said, "in view of the fact that you are scheduled to die by hanging at eight o'clock to-morrow night. Your life and death are in your own hands."

Von Kettler bowed ironically. Standing in the Superintendent's presence in the uniform of the condemned cell, collarless, bare-headed, he yet seemed to dominate the other by a certain poise, breeding, nonchalance.

"Your life is offered you in consideration of your making a complete written confession of the whole ramifications of the plot against the Federal Government," the Superintendent continued.

"Rather a confession of weakness, my dear Superintendent," jeered the prisoner.

"Oh don't worry about that! The Government has unravelled a good deal of the conspiracy. It knows that you and your international associates are planning to strike at civilized government throughout the world, in the effort to restore the days of autocracy. It knows you are planning a world federation of states, based on the principles of absolutism and aristocracy. It is aware of the immense financial resources behind the movement. Also that you have obtained the use of certain scientific discoveries which you believe will aid you in your schemes."

"I was wondering," jeered the prisoner, "how soon you were coming to that."

"They didn't help you in your murderous scheme," the Superintendent thundered. "You were found in the War Office by the night watchman, rifling a safe of valuable documents. You shot him with a pistol equipped with a silencer. You shot down two more who, hearing his cries, rushed to his aid. And you attempted to stroll out of the building, apparently under the belief that you possessed mysterious power which would afford you security."

"A little lapse of judgment such as may happen with the best laid plans," smiled Von Kettler. "No, Superintendent, I'll be franker with you than that. My capture was designed. It was decided to give the Government an object lesson in our power. It was resolved that I should permit myself to be captured, in order to demonstrate that you cannot hang me, that I have merely to open the door of my cell, the gates of this penitentiary, and walk out to freedom."

"Have you quite finished?" rasped the Superintendent.

"At your disposal," smiled the other.

"Here's your last chance, Von Kettler. Your persistence in this absurd claim has actually shaken the expressed conviction of some of the medical examiners that you are sane. If you will make that complete written confession that the Government asks of you, I pledge you that you shall be declared insane to-night, and sent to a sanitarium from which you will be permitted to escape as soon as this affair has blown over."

"The United States Government has sunk pretty low, to involve itself in a deal of this character, don't you think, my dear Superintendent?" jeered Von Kettler.

"The Government is prepared to act as it thinks best in the interests of humanity. It knows that the death of one wretched murderer such as yourself is not worth the lives of thousands of innocent men!"

"And there," smiled Von Kettler, without abating an atom of his nonchalance, "there, my dear Superintendent, you hit the nail on the head. Only, instead of thousands, you might have said millions."

Von Kettler's aspect changed. Suddenly his eyes blazed, his voice shook with excitement, his face was the face of a fanatic, of a prophet.

"Yes, millions, Superintendent," he thundered. "It is a holy cause that inspires us. We know that it is our sacred mission to save the world from the drabness of modern democracy. The people—always the people! Bah! what are the lives of these swarming millions worth when compared with a Caesar, a Napoleon, an Alexander, a Charlemagne? Nothing can stop us or defeat us. And you, with your confession of defeat, your petty bargaining—I laugh at you!"

"You'll laugh on the gallows to-morrow night!" the Superintendent shouted.

Again Von Kettler was the calm, superior, arrogant prisoner of before. "I shall never stand on the gallows trap, my dear Superintendent, as I have told you many times," he replied. "And, since we have reached what diplomacy calls a deadlock, permit me to return to my cell."

The Superintendent pressed a button on his desk; the guards, who had been waiting outside the office, entered hastily. "Take this man back," he commanded, and Von Kettler, head held high, and smiling, left the room between them.

The Superintendent pressed another button, and his assistant entered, a rugged, red-haired man of forty—Anstruther, familiarly known as "Bull" Anstruther, the man who had in three weeks reduced the penitentiary from a place of undisciplined chaos to a model of law and order. Anstruther knew nothing of the Superintendent's offer to Von Kettler, but he knew that the latter had powerful friends outside.

"Anstruther, I'm worried about Von Kettler," said the Superintendent. "He actually laughed at me when I spoke of the possibility of another medical examination. He seemed confident that he could not be hanged. Swore that he will never stand on the gallows trap. How about your precautions for tomorrow night?"

"We've taken all possible precautions," answered

Anstruther. "Special armed guards have been posted at every entrance to the building. Detectives are patrolling all streets leading up to it. Every car that passes is being scrutinized, its plate numbers taken, and forwarded to the Motor Bureau. There's no chance of even an attempt at rescue—literally none."

"He's insane," said the Superintendent, with conviction, and the words filled him with new confidence. It had been less Von Kettler's statements than the man's cool confidence and arrogant superiority that had made him doubt. "But he's not too insane to have known what he was doing. He'll hang."

"He certainly will," replied Anstruther. "He's just a big bluff, sir."

"Have him searched rigorously again to-morrow morning, and his cell too—every inch of it, Anstruther. And don't relax an iota of your precautions. I'll be glad when it's all over."

He proceeded to hold a long-distance conversation

with Washington over a special wire.

In his cell, Von Kettler could be seen reading a book. It was Nietzsche's "Thus Spake Zarathustra," that compendium of aristocratic insolence that once took the world by storm, until the author's mentality was revealed by his commitment to a mad-house. Von Kettler read till midnight, closely observed by the guard at the trap, then laid the word aside with a yawn, lay down on his cot, and appeared to fall instantly asleep.

Dawn broke. Von Kettler rose, breakfasted, smoked the perfecto that came with his ham and eggs, resumed his book. At ten o'clock Bull Anstruther came with a guard and stripped him to the skin, examining every inch of his prison garments. The bedding followed; the cell was gone over microscopically. Von Kettler, permitted to dress again, smiled ironically. That smile stirred Anstruther's gall.

"We know you're just a big bluff, Von Kettler," snarled the big man. "Don't think you've got us going. We're just taking the usual precautions, that's all."

"So unnecessary," smiled Von Kettler. "To-night I shall dine at the Ambassador grill. Watch for me there. I'll leave a memento."

Anstruther went out, choking. Early in the afternoon two guards came for Von Kettler.

"Your sister's come to say good-by to you," he was told, as he was taken to the visitors' cell.

This was a large and fairly comfortable cell in a corridor leading off the death house, designed to impress visitors with the belief that it was the condemned man's permanent abode; and, by a sort of convention, it was understood that prisoners were not to disabuse their visitors' minds of the idea. The convention had been honorably kept. The visitor's approach was checked by a grill, with a two-yards space between it and the bars of the cell. Within this space a guard was seated: it was his duty to see that nothing passed.

As soon as Von Kettler had been temporarily established in his new quarters, a pretty, fair-haired

young woman came along the corridor, conducted by the Superintendent himself. She walked with dignity, her bearing was proud, she smiled at her brother through the grill, and there was no trace of weeping about her eyes.

She bowed with pretty formality, and Von Kettler saluted her with an airy wave of the hand. Then they began to speak, and the German guard who had been selected for the purpose of interpreting to the Superintendent afterward, was baffled.

It was not German—neither was it French, Italian, or any of the Romance languages. As a matter of fact, it was Hungarian.

Not until the half-hour was up did they lapse into English, and all the while they might have been conversing on art, literature, or sport. There was no hint of tragedy in this last meeting.

"Good-by, Rudy," smiled his sister, "I'll see you soon."

"To-night or to-morrow," replied Von Kettler

indifferently.

The girl blew him a kiss. She seemed to detach it from her mouth and extend it through the grill with a graceful gesture of the hand, and Von Kettler caught it with a romantic wave of the fingers and strained it to his heart. But it was only one of those queer foreign ways. Nothing was passed. The alert guard, sitting under the electric light, was sure of that.

They searched Von Kettler again after he was back in the death house. The other cells were empty. In three of them detectives were placed. In the yard beyond the hangman was experimenting with the trap. He himself was under close observation. Nothing was being left to chance.

At seven o'clock two men collided in the death-house entrance. One was a guard, carrying Von Kettler's last meal on a tray. He had demanded Perigord truffles and paté de foie gras, cold lobster, endive salad, and near-beer, and he had got them. The other was the chaplain, in a state of visible agitation.

"If he was an atheist and mocked at me it wouldn't be so bad," the good man declared. "I've had plenty of that kind. But he says he's not going to be hanged. He's mad, mad as a March hare. The Government has no right to send an insane man to the gallows."

"All bluff, my dear Mr. Wright," answered the Superintendent, when the chaplain voiced his protest. "He thinks he can get away with it. The commission has pronounced him sane, and he must pay the penalty of his crime."

By that mysterious process of telegraphy that exists in all penal institutions, Von Kettler's boast that he would beat the hangman had become the common information of the inmates. Bets were being laid, and the odds against Von Kettler ranged from ten to fifteen to one. It was generally agreed, however, that Von Kettler would die game to the last.

"You all ready, Mr. Squires?" the prowling Superintendent asked the hangman.

"Everything's O. K., sir."

The Superintendent glanced at the group of newspaper men gathered about the gallows. They, too, had heard of the prisoner's boast. One of them asked him a question. He silenced him with an angry look.

"The prisoner is in his cell, and will be led out in ten minutes. You shall see for yourselves how much truth there is in this absurdity," he said.

He looked at his watch. It lacked five minutes of eight. The preparations for an execution had been reduced almost to a formula. One minute in the cell, twenty seconds to the trap, forty seconds for the hangman to complete his arrangements: two minutes, and then the thud of the false floor.

Four minutes of eight. The little group had fallen silent. The hangman furtively took a drink from his hip-pocket flask. Three minutes! The Superintendent walked back to the door of the death house and nodded to the guard.

"Bring him out quick!" he said.

The guard shot the bolt of Von Kettler's cell. The Superintendent saw him enter, heard a loud exclamation, and hurried to his side. One glance told him that the prisoner had made good his boast.

Von Kettler's cell was empty!

Chapter 2: Conference

Captain Richard Rennell, of the U. S. Air Service, but temporarily detached to Intelligence, thought that Fredegonde Valmy had never looked so lovely as when he helped her out of the cockpit.

Her dark hair fell in disorder over her flushed cheeks, and her eyes were sparkling with pleasure.

"A thousand thanks, M'sieur Rennell," she said, in her low voice with its slight foreign intonation. "Never have I enjoyed a ride more than to-day. And I shall see you at Mrs. Wansleigh's ball to-night?"

"I hope so—if I'm not wanted at Headquarters," answered Dick, looking at the girl in undisguised admiration.

"Ah, that Headquarters of yours! It claims so much of your time!" she pouted. "But these are times when the Intelligence Service demands much of its men, is it not so?"

"Who told you I was attached to Intelligence?" demanded Dick bluntly.

She laughed mockingly. "Do you think that is not known all over Washington?" she asked. "It is strange that Intelligence should act like the—the ostrich, who buries his head in the sand and thinks that no one sees him because it is hidden."

Dick looked at the girl in perplexity. During the past month he had completely lost his head and heart over her, and he was trying to view her with the dispassionate judgment that his position demanded.

As the niece of the Slovakian Ambassador, Mademoiselle Valmy had the entry to Washington society. The Ambassador was away on leave, and she had appeared during his absence, but she had been accepted unquestionably at the Embassy, where she had taken up her quarters, explaining—as the Ambassador confirmed by cable—that she had sailed under a misconception as to the date of his leave.

Brunette, beautiful, charming, she had a score of

hearts to play with, and yet Dick flattered himself that he stood first. Perhaps the others did too.

"Of course," the girl went on, "with the Invisible Emperor threatening organized society, you gentlemen find yourselves extremely busy. Well, let us hope that you locate him and bring him to book."

"Sometimes," said Dick slowly, "I almost think that you know something about the Invisible Emperor."

Again she laughed merrily. "Now, if you had said that my sympathies were with the Invisible Emperor, I might have been surprised into an acknowledgment," she answered. "After all, he does stand for that aristocracy that has disappeared from the modern world, does he not? For refinement of manners, for beauty of life, for all those things men used to prize."

"Likewise for the existence of the vast body of the nation in ignorance and poverty, in filth and squalor," answered Dick. "No, my sympathies are with law and order and democracy, and your Invisible Emperor and his crowd are simply a gang of thieves and hold-up

men."

"Be careful!" A warning fire burned in the girl's eyes.

"At least, it is known that the Emperor's ears are long."

"So are a jackass's," retorted Dick.

He was sorry next moment, for the girl received his answer in icy silence. In his car, which conveyed them from the tarmac to the Embassy, she received all his overtures in the same silence. A frigid little bow was her farewell to him, while Dick, struggling between resentment and humiliation, sat dumb and wretched at the wheel.

Yet the idea that Fredegonde Valmy had any knowledge of the conspiracy or its leaders never entered Dick's head. He was only miserable that he had offended her, and he would have done anything to have straightened out the trouble.

It seemed impossible that in the year 1940 the peace of the civilized world could be threatened by an

international conspiracy bent on restoring absolutism, and yet each day showed more clearly the immense ramifications of the plot. Each day, too, brought home to the investigating governments more clearly the fact that the things they had discovered were few in number in comparison with those they had not.

The headquarters of the conspirators had never been discovered, and it was suspected that the powerful mind behind them was intentionally leading the investigators along false trails.

The conspiracy was world-wide. It had been behind the revolution that had recreated an absolutist monarchy in Spain. It had plunged Italy into civil war. It had thrown England into the convulsions of a succession of general strikes, using the communist movement as a cloak for its activities.

But nobody dreamed that America could become a fertile field for its insidious propaganda. Yet it was behind the millions of adherents of the so-called Freeman's Party, clamoring for the destruction of the constitution. Upon the anarchy that would follow the

absolutist regime was to be erected.

Already the mysterious powers had struck. Departments of State had been entered and important papers abstracted. The *Germania* had mysteriously disappeared in mid-Atlantic, and a shipping panic had ensued. There were tales of mysterious figures materializing out of nothingness. It was known that the conspirators were in possession of certain chemical and electrical devices with which they hoped to achieve their ends.

The Superintendent of the penitentiary had had in his pocket an authorization to stop the execution of Von Kettler after he stood on the trap. Dead, he would be a mere mark of vengeance: alive, he might be persuaded to furnish some clue to the headquarters of the miscreants.

And behind the conspirators loomed the unknown figure that signed itself the Invisible Emperor—in the communications that poured in to the White House and to the rulers of other nations. In the threats that were materializing with stunning swiftness.

Who was he? Rumor said that a former European ruler had not died as was supposed: that a coffin weighted with lead had been buried, and that he himself in his old age, had gone forth to a mad scheme of world conquest with a body of his nobles.

It had been practically a state of war since the shipment of gold, guarded by a detachment of police, had been stolen in broad daylight outside Baltimore, the police clubbed and killed by invisible assailants—as they claimed. The press was under censorship, troops under arms, and it was reported that the fleet was mobilizing.

In the midst of it all, Washington shopped, danced, feasted, flirted, like a swarm of may flies over a treacherous stream.

Intelligence was alert. As Dick started to drive away from the Slovakian Embassy, a man stepped quickly to the side of the car and thrust an envelope into his hand. Dick opened it quickly. He was wanted by Colonel Stopford at once, not at the camouflaged Headquarters at the War Department, but at the real

Headquarters where no papers were kept but weighty decisions were made. And to that devious course the Government had already been driven.

Dick parked his car in a side street—it would have been under espionage in any of the official parking places—and set off at a smart walk toward his destination. Nobody would have guessed, from the appearance of the streets, that a national calamity was impending. The shopping crowds were swarming along the sidewalks, cars tailed each other through the streets; only a detachment of soldiers on the White House lawn lent a touch of the martial to the scene.

The building which Dick entered was an ordinary ten-story one in the business section; the various legal firms and commercial concerns that occupied it would have been greatly surprised to have known the identity of the Ira T. Graves, Importer, whose name appeared in modest letters upon the opaque glass door on the seventh story. Inside a flapper stenographer—actually one of the most trusted members of Intelligence's staff—asked Dick's name,

which she knew perfectly well. Not a smile or a flicker of an eyelid betrayed the fact.

"Mr. Rennell," said Dick with equal gravity.

The girl passed into an inner room, and a buzzer sounded. In a few moments the girl came back.

"Mr. Graves will be here in a few minutes, Mr. Rennell, if you'll kindly wait in his office," she said.

Dick thanked her, and walked through into the empty office. He waited there till the girl had closed the door behind him, then went out by another door and found himself again in the corridor. Opposite him was a door with the words "Entrance 769" and a hand pointing down the corridor to where the Intelligence service had established another perfectly innocent front. Dick tapped lightly at this door, and a key turned in the lock.

The man who stepped quickly back was one of the heads of the Civil Service. The man at the flat-topped desk was Colonel Stopford. The man on a chair beside

him was one of the heads of the police force.

The Colonel, a big, elderly man, dressed in a grey sack suit, checked Dick's commencing salutation. "Never mind etiquette, Rennell," he said. "Sit down. You've heard about the man Von Kettler's escape last night, of course?"

"Yes, sir."

"It's known, then. We can't keep things dark. He vanished from his cell in the death house, three minutes before the time appointed for his execution, though, as a matter of fact, he wasn't going to be hanged. Apparently he walked through the walls.

"There's a sequel to it, Rennell. It seems he had told the assistant-superintendent, a man named Anstruther, that he'd meet him at a restaurant in town that night. He promised to leave him a memento. Anstruther happened to remember this boast of Von Kettler's, and he surrounded the restaurant with armed detectives, on the chance that the fellow would show up. Rennell, *Von Kettler was there!*"

"He went to this restaurant, sir?"

"He walked in, just before the place was surrounded, engaged a table, and ordered a sumptuous meal. He told the waiter his name, said he expected a friend to join him, walked into the wash-room—and vanished! Two minutes later Anstruther and his men were on the job. Von Kettler never came out of the wash-room, so far as anybody knows.

"In the midst of the hue and cry somebody pointed to the table that Von Kettler had engaged. There was a twenty-dollar bill upon it, and a scrap of paper reading: 'I've kept my word. Von K.'"

Colonel Stopford looked at Dick fixedly. "Rennell, we may be fools," he said, "but we realize what we're up against. It's a big thing, and we're going to need all our fighting grit to overcome it. You're one of the four men we're depending on. We're counting on you because of your record, and because of your degree in science at Heidelberg. The President wishes you to take charge of the whole Eastern Intelligence District, covering the entire south-eastern seaboard of the

United States. You are to have complete freedom of action, and all civil, military, and naval officials have received instructions to co-operate with you."

"There goes Mrs. Wansleigh's ball," thought Dick, but he said nothing.

"We're not the hunters, Dick Rennell," went on Colonel Stopford. "We're hiding under cover, and I'm counting on you to turn the tables. They even know my office is here. I had a long distance call from Savannah this morning in mocking vein. They advised me to have the White House watched to-night. I warned the President, and we've posted guards all round it."

"They held the wire while you called up the President?" asked Dick.

"Damn it, no! They called me up from Scranton the instant he'd finished speaking. They have the power of the devil, Rennell, with that infernal invisibility invention of theirs. Rennell, we're fighting unknown forces. Who this Invisible Emperor is, we don't even

know. But one thing we've found out. He has his headquarters somewhere in your district. Somewhere along the south Atlantic seaboard. The greater part of his activities emanate from there. But we're fighting in the dark. The clue, the master clue that will enable us to locate him—that's what we lack."

The sun had set, it was beginning to grow dark. Colonel Stopford switched on the electric lamp beside his desk.

"What have you to say, Rennell?" he asked; and Dick was aware that the two other men were regarding him attentively.

"It's evident," said Dick, "that Von Kettler possessed this means of invisibility in his cell, and wasn't detected. He simply slipped out when the guard came to fetch him."

"Invisibility? Yes! But invisible's not the same thing as transparent," cried Stopford. "These folks have operated in broad daylight. They're transparent, damn them! Not even a shadow! You know what I

mean, Rennell! What I'm thinking of! That crazy man you were in touch with six months ago, who prophesied this! We turned him down! He showed me a watch and said the salvation of the world was inside the case! I thought him insane!"

"You mean Luke Evans, sir. That watch was his pocket model. He went off in a huff, saying the time would come when we'd want him and not be able to find him."

"But, damn him, he wanted to produce universal darkness, or some such nonsense, Rennell, and I told him that we wanted light, not darkness."

"It wasn't exactly that, sir." Colonel Stopford was a man of the old school: he had been an artillery officer in the Great War, and was characteristically impatient of new notions. Dick began carefully: "You'll remember, sir, old Evans claimed to have been the inventor of that shadow-breaking device that was stolen from him and sold in England."

"To a moving picture company!" snorted Stopford. "I

asked him what moving pictures had to do with war."

"Evans was convinced that the invention would be applied to war. He claimed that it made the modern methods of military camouflage out of date completely. He said that by destroying shadows one could produce invisibility, since visibility consists in the refraction of wave lengths by material objects.

"When they stole his invention, he foresaw that it would be used in war. He set to work to nullify his own invention. He told me that he had unintentionally given to the enemies of the United States a means of bringing us to our knees, since he believed that British motion picture company was actually a subsidiary of Krupp's. He worked out a method of counteracting it."

"You must get him, Rennell. Even if it's all nonsense, we can't afford to let any chance go. If Evans's invention will counteract this damned invisibility business—"

The telephone on the Colonel's desk rang. He picked

it up, and his face assumed an expression of incredulity. He looked about him, like a man bewildered. He beckoned to the police official, who hurried to his side, and thrust the receiver into his hand. The official listened.

"All right," he said. He turned to Dick and the Civil Service representative.

"Gentlemen," he said, "the President has disappeared from his office in the White House, and there are grave fears that he has been kidnapped!"

Chapter 3: In the White House

Colonel Stopford's car had been parked around the corner of the building, and within a minute the four men were inside it, Stopford at the wheel, and racing in the direction of the White House. A nod to the guard at the gate, and they were inside the grounds. At the entrance a single guard, in place of the four who should have been posted there, challenged sharply, and attempted to bar the way, not recognizing Dick or Stopford in their civilian clothes.

"Where's your officer?" demanded Stopford sharply.

Half-cowed by the Colonel's manner, the young recruit hesitated, and the four swept him out of the way and hurried on. The scene outside the main entrance to the White House was one of indescribable confusion. Soldiers were swarming in confused groups, some trying to force an entrance, others pouring out. Every moment civilians, streaming over the lawn, added to the number. Discipline seemed almost abandoned. From inside the building came outbursts of screams and cursing, the scuffling of a

mob.

"Roscoe! Roscoe!" shouted Stopford. "Where's the President's secretary? Who's seen him? Let us pass immediately!"

No one paid the least attention to him. But a short, bare-headed civilian, who was struggling in the crowd, heard, and shouted in answer, waved his arms, and began to force his way toward the four. It was Roscoe, the secretary of President Hargreaves. The President was a childless widower, and Roscoe lived in the White House with him and was intimately in his confidence.

Roscoe gained Stopford's side. "Say—they've got him!" he panted. "They've got him somewhere—inside the building. They're trying to get him out! We've got to save him—but we can't see them—or him. They've made him invisible too, curse them! I heard him crying, 'Help me, Roscoe!' He saw me, I tell you—and I didn't know where he was!"

The little secretary was almost incoherent with fear

and anger. The five men, forming a wedge, hurled themselves forward. Out of the White House entrance appeared a tall officer, revolver in hand. It was Colonel Simpson, of the President's staff. Half beside himself, he swept the weapon menacingly about him, shouting incoherently, and clearing a passage, into which the five hurled themselves.

Stopford seized his revolver hand, and after a brief struggle Simpson recognized him.

"He's in the building!" he shouted wildly. "Somewhere upstairs! I'm trying to form a cordon, but this damned mob's in the way. Kick those civilians out!" he cried to the soldiers. "Shoot them if they don't go! Guard the windows!"

Stopford and Dick, at the head of the wedge, pushed past into the White House. The interior was packed, men were struggling frantically on the staircase; it seemed hopeless to try to do anything.

Suddenly renewed yells sounded from above, a scream of anguish, howls of terror. There came a

downward surge, then a forward and upward one, which carried the two men up the stairs and into the President's private apartments above.

In the large reception-room a mob was struggling at a window, beneath a blaze of electric light. A soldier was standing there like a statue, his face fixed with a leer of horror. In his hands was a rifle, with a blood-stained bayonet, dripping upon the hardwood floor at the edge of the rug. Upon the rug itself a stream of blood was spouting out of the air.

Dick looked at the sight and choked. There was something appalling in the sight: it was the quintessence of horror, that widening pool of blood, staining the rug, and flowing from an invisible body that writhed and twisted, while moans of anguish came from unseen lips.

Colonel Stopford leaped back, livid and staring. "God, it's got eyes—two eyes!" he shouted.

Dick saw them too. The eyes, which alone were visible, were about six inches from the floor, and they

were appearing and disappearing, as they opened and shut alternately. It was a man lying there, a dying man, pierced by the soldier's bayonet by pure accident, dying and yet invisible.

The mob had scattered with shrieks of terror, but a few bolder spirits remained in a thin circle about that fearful thing on the rug. Dick bent over the man, and felt the outlines of the writhing body. It was a man, apparently dressed in some sort of uniform, but this was covered, from the top of the head to the feet, with a sort of sheer silken garment, bifurcating below the waist, and resembling a cocoon. It seemed to appear and alternately to vanish.

Dick seized the filmy stuff in his fingers, rent it, and stripped it away. Yells of terror and amazement broke from the throats of all. Instantly the thin circle of spectators had become reinforced by a struggling mass of men.

The half-visible cocoon clung to Dick's body like spider webs. But the man who had been wearing it had sprung instantly into view beneath the cluster of

electric lights. He was a fair-haired young fellow of about thirty years, his features white and set in the agony of death.

He was dressed in a trim uniform of black, with silver braid, and on his shoulders were the insignia of a lieutenant. He opened his eyes, blue as the skies, and stared about him. He seemed to understand what had happened to him.

"Dogs!" he muttered.

Shrieks of fury answered him. The mob surged toward him as if to grind his face to pieces under their feet—and then recoiled, mouthing and gibbering. But it was at Dick that they were looking, not at the dying man.

He raised himself upon one elbow with a mighty effort. "His Majesty the Invisible Emperor! Long be his reign triumphant!" he chanted. It was his last credo. The words broke from his lips accompanied by a torrent of red foam. His head dropped back, his body slipped down; he was gone. And no one seemed

to observe his passing. They were all screaming and gibbering at Dick.

"Rennell! Rennell!" yelled Stopford. "Where are you, Rennell? God, man, what's happened to your legs?"

Dick looked down at himself. For a moment he had the illusion that he was a head and a trunk, floating in the air. His lower limbs had become invisible, except for patches of trousering that seemed to drift through space. The mob in the room had fallen back gaping at him in horror.

Then Dick understood. It was the invisible garment that had coiled itself about him. He tore it from him and became visibly a man once more.

Shouts from another room! A surging movement of the crowd toward it. The muffled sounds of an automatic pistol, fitted with a silencer! Then screams:

"The devils are in there! They're murdering the soldiers!"

There followed a panic-stricken rush, more muffled firing, and then the sharp roar of rifles, and the fall of plaster. Some one was bawling the President's name. The rooms became a mass of milling human beings, lost to all self-control.

A bedlam of noise and struggle. Men fought with one another blindly, cursing soldiers fired promiscuously among the mob, riddling the walls, stabbing at the air. The plaster was falling in great chunks everywhere, filling the rooms with a heavy white cloud, in which all choked and struggled. The yells of the civilian mob below, struggling helplessly in the packed crowd that wedged the great stairway, made babel. Outside the White House a dense mob that filled the lawns was yelling back, and struggling to gain admittance. Suddenly the lights went out.

"They've cut the wires!" rose a wild, wailing voice.
"The devils have cut the wires! Kill them! Kill everybody!"

His cry ended in a gurgle. Somewhere in that dark hell a struggle was going on, a well defined struggle,

different from the random, aimless battling of the half-crazed soldiers and the civilians. President Hargreaves was still within the walls of the White House, it was known; it was physically impossible for him to have been carried away when every foot of space was packed. And through that darkness the invisible assailants were edging him, foot by foot, toward the outside.

Dick was on the edge of this silent battle. He sensed it. Bracing himself against a bureau, while the mob surged past him, he tried to pierce the gloom, to reinforce with his perceptions what his instinct told him. A soldier, crazed with fear, came leaping at him, bayonet leveled. He thrust with a grunt. Dick avoided the glancing steel by a hand's breadth, and, as the impetus of the man's attack carried him forward, caught him beneath the chin with a stiff right-hand jolt that sent him sprawling.

From below the cries broke out again, with renewed violence: "They've got the President! Get them! Get them! Close all doors and windows!"

But a door went crashing down somewhere, to the tune of savage yells. The mob was pouring down the stairs. It was growing less packed above. Dick heard Stopford's voice calling his name.

"Here, sir" he shouted back, and the two men collided.

"For God's sake do what you can, Rennell!" shouted the Colonel. "They've got the President downstairs. They had him in this very room, in the thick of it all. I heard him cry out, as if under a gag. They put one of those damned cloths over him. God, Rennell, I'm going crazy!"

The upper floor of the White House was almost empty now. Dick thrust himself into the crowd that still jammed the stairs. He reached the ground floor. It was lighter here, but a glance showed him that it was impossible to attempt to restore any semblance of order. The big East Room was jammed with a fighting, cursing throng. Dick stumbled over the bodies of those who had fallen in the press, or had been shot down. Outside the mob was thickening, swarming

through the grounds and screeching like madmen.

Nothing that could be done! Dick found himself caught once more in the human torrent. Presently he was wedged up against a broken window. He precipitated himself through the frame, dropped to the ground, stopped for an instant to catch breath.

The yelling mob was congregated about the main entrance of the White House, and on this side the grounds were comparatively empty. As Dick stopped, trying desperately to form some plan of action, he heard footsteps and low voices near him. Then two men came toward him, followed by three or four others.

The men—but, though the light was faint, Dick realized instantly that they were wearing invisible garments. He could see nothing of them; he could see through where they seemed to be—the trees, the buildings of the streets. Yet they were at his elbow. And they saw him. He heard one of them leap, and sprang aside as the butt of a pistol descended through the air and dropped where his head had

been.

Yet no hand had seemed to hold it. It had been a pistol, reversed, and flashing downward, to be arrested in mid-air six inches from his face. But the men were not wholly invisible. Nearly six feet above the ground, three or four pairs of eyes were staring malevolently into Dick's. Only the eyes were there.

The two foremost men were breathing heavily. They were carrying something. Grotesquely through a rent in the invisible garment Dick saw a patch of trouser. He heard a muffled sigh. President Hargreaves, in the hands of his abductors!

Dick's actions were reflex. As the pistol hung beside his face, he snatched at it, wrested it away, struck with it, and heard a curse and felt the yielding impact of bone and flesh. He had missed the head but struck the shoulder. Next moment hands gripped the weapon, and a desperate struggle began.

It was torn from Dick's grasp. He struck out at random, and his fist collided with the chin of a

substantial flesh and blood human being. Invisible arms grasped him. He fought free. The pistol slashed his face sidewise, the sight ripping a strip of flesh from the cheek. He was surrounded, he was being beaten down, though he was fighting gamely.

"Kill the swine! Shoot! Shoot!" Dick heard one of his assailants muttering.

Out of the void appeared the blue muzzle of another automatic, with a silencer on it. Dick ducked as a flame spurted from it. He felt the bullet stir his hair. He grasped at the hand that held it, and missed. Then he was held fast, and the muzzle swung implacably toward his head again. Helpless, he watched it describe that arc of death. It was only later that he wondered why he had fought all the while in silence, instead of crying for help.

But of a sudden the pistol was dashed aside. A woman's voice spoke peremptorily, in some language Dick did not understand. And he saw her eyes among the eyes that glared at him. Dark eyes that he knew, even if the voice had not revealed her identity. The

eyes and voice of Fredegonde Valmy!

Dick cried her name. He put forth all his strength in a final struggle. Suddenly he felt a stunning impact on the back of the head. He slipped, reeled, threw out his hands, and sank down unconscious on the grass at the side of the path.

Chapter 4: The Invisible Ambassador

Fredegonde Valmy implicated in the conspiracy! That was the first thought that flashed into Dick's mind as he recovered consciousness. He might have suspected it! But the idea that the girl he loved was bound up with the murderous gang that was attacking the very foundations of civilization chilled him to the soul.

Dick had been picked up a few minutes after he had been struck down, identified by Colonel Stopford as he was about to be removed to a hospital, and carried into the White House. Order had been restored by the arrival of a detachment of troops from Fort Myers, the severed cables located and mended, and by midnight the interior of the Presidential home had been made habitable again.

President Hargreaves was gone—kidnapped despite the utmost efforts to protect him; and it was impossible to conceal that fact from the world. But the wheels of government still revolved. All night an emergency council sat in the White House, and, deciding that in a time of such grave danger heroic

means must be adopted, with the consent of such of the Congressional leaders as could be summoned, a Council of Defence was organized.

The whole country east of the Mississippi was placed under martial law. The fleet and army were put on a war footing. Flights of airplanes were assembled at numerous points along the eastern seaboard. To this Council Donald was attached as head of Intelligence for the Eastern Division. Yet all this availed little unless the location of the Invisible Empire could be ascertained, and, despite telegraphic reports that came in hourly, alleging to have discovered its headquarters, nothing had been achieved in this direction.

The garment taken from the slain soldier had been examined by a half-dozen of the leading chemists of the East. Pending the arrival from New York of the celebrated Professor Hosmeyer, it was deposited under military guard in a dark closet. The result was unfortunate. The garment exhibited to the assembled scientists was a mere bifurcated silken bag.

The gas with which it had been impregnated, though it had been heavy enough to adhere to the fabric for hours, had also been volatile enough to have disappeared completely, leaving a residue which was identified as a magnesium isotope.

Equally spectacular had been the disappearance of Mademoiselle Fredegonde Valmy. A cable from the Slovakian Ambassador had arrived a few hours later, denying her authenticity. And with her disappearance came the discovery that she had been at the head of an espionage system with ramifications in every state department, and in every statesman's home.

Three days passed with no sign from the enemy. The Council sat all day. In the executive offices of the White House Dick toiled ceaselessly, planning, receiving reports, organizing the flights of airplanes at strategic points throughout his district. From time to time he would be summoned to the Council. At night he threw himself upon a cot in his office and slept a sleep broken by the constant arrival of messengers. And still there was no clue to the location of the headquarters of the marauders.

But in those three days there had been no sign of them. Hope had succeeded despair; in the rebound of confidence the populace was beginning to ridicule the nation-wide precautions against what were coming to be considered merely a gang of super-criminals. It was even whispered that President Hargreaves had not been kidnapped at all. The Freeman's Party accused the Government of a plot to subvert popular liberties.

Dick received a summons on the third evening. Utterly worn out with his work, he pulled himself together and made his way into the Blue Room, where the Council was assembled. Vice-president Tomlinson, an elderly man, was in the chair. A non-entity, pushed into a post it had been thought he would adorn innocuously, he had been overwhelmed by his succession to the chief office of State.

Tomlinson did not like Dick, or any of the hustling younger officers who, unlike himself, realized the real significance of the danger that overhung the country. He sat pompously in his leather chair, regarding Dick as he entered in obedience to the summons.

"Well, Captain Rennell, what have you to report to us this evening?" he inquired, as Dick saluted and stood to attention at the table.

"We're improving our concentrations, Mr. Vice-president. We've eight flights of seaplanes scouring the coast in the hope of locating the stronghold of the Invisible Emperor. We've—"

"I'm sick and tired of that title," shouted Tomlinson. He sprang to his feet, his face flushed with anger. His nerves had broken under the continuous strain. "I'll give you my opinion, Captain Rennell," he said. "And that is that this so-called Invisible Emperor is a myth.

"A gang of thieves has invented a paint that renders them inconspicuous, has created a panic, and is taking advantage of it to terrorize the country. The whole business is poppycock, in my opinion, and the sooner this bubble bursts the better. Well, sir, what have you to say to that?"

"Have you ever seen any of these men in their invisible clothing, if I may ask, Mr. Vice-president?"

inquired Dick, trying to keep down his anger. His nerves, too, were badly frazzled.

"No, sir, I have not, but my opinion is that this story is grossly exaggerated, and that the persons responsible are the reporters of our sensational press!" thundered Tomlinson.

He looked about him, a weak man proud of having asserted his authority. Somebody laughed.

Tomlinson glared at Dick, his rubicund visage purpling. But it was not Dick who had laughed. Nor any one at the council table.

That laugh had come from the wall beside the door. Again it broke forth, high-pitched, cold, derisive. All heads turned as if upon pivots to see who had uttered it.

"Good God!" exclaimed Secretary Norris, of the War Department, and slumped in his chair.

Five feet eight inches from the floor a pair of grey

eyes looked at the Council members out of emptiness. Grey eyes, a man's eyes, cool, contemptuous, and filled with authority, with a contemptuous sense of superiority that left every man there dumb.

Dick was the first to recover himself. He stepped forward, not to where the invisible man was standing, but to a point between him and the door.

That cold laugh broke forth again. "Gentlemen, I am an ambassador from my sovereign, who chooses to be known as the Invisible Emperor," came the words. "As such, I claim immunity. Not that I greatly care, should you wish to violate the laws of nations and put me to death. But, believe me, in such case the retribution will be a terrible one."

Suddenly the envoy peeled off the gas-impregnated garments that covered him. He stood before the Council, a fair-haired young man, clad in the same fashion of trim black uniform as the bayoneted soldier had worn upstairs three nights before.

He bowed disdainfully, and it was Tomlinson who

shouted:

"Arrest that man! I know his face! I've seen it in the papers. He's Von Kettler, the murderer who escaped from jail in an invisible suit."

"Oh, come, Mr. Vice-president," laughed Von Kettler, "are you sure this isn't all very much exaggerated?"

Tomlinson sank back in his chair, his ruddy face covered with sweat. Dick stared at Von Kettler. A suspicion was forming in his mind. He had seen eyes like those before, dark instead of grey, and yet with the same look of pride and breeding in them; the look of the face, too, impossible to mistake—he knew!

Fredegonde Valmy was Von Kettler's sister!

"Well, gentlemen, am I to receive the courtesies of an ambassador?" inquired Van Kettler, advancing.

"You shall have the privileges of the gallows rope!" shouted Tomlinson. "Arrest that man at once, Captain Rennell!"

"Pardon me, Mr. Vice-president," suggested the Secretary for the Navy blandly, "but perhaps it would be more desirable to hear what he has to say."

"Immunity for thieves, robbers, murderers!"

"Might I suggest," said Von Kettler suavely, "that, since the United States has honored my master by placing itself upon a war footing, it has accorded him the rights of a belligerent?"

"We'll hear you, Mr. Von Kettler," said the Secretary of State, glancing along the table. Three or four nodded, two shook their heads: Tomlinson only glared speechlessly at the intruder. Von Kettler advanced to the table and laid a paper upon it.

"You recognize that signature, gentlemen?" he asked.

At the bottom of the paper Dick saw scrawled the bold and unmistakable signature of President Hargreaves.

"An order signed by the President of your country,"

purred Von Kettler, "ordering your military forces replaced upon a peace footing, and the acceptance of our conditions. They are not onerous, and will not interfere with the daily life of the country. Merely a little change in that outworn document, the Constitution. My master rules America henceforward."

Somebody laughed: another laughed: but it was the Secretary of State who did the fine thing. He took up the paper bearing what purported to be President Hargreaves's signature, and tore it in two.

"The people of this country are her rulers," he said, "not an old man dragooned into signing a proclamation while in captivity—if indeed that is President Hargreaves's signature."

There came a sudden burst of applause. Von Kettler's face became the mask of a savage beast. He shook his fist furiously.

"You call my master a forger?" he shouted. "You yourselves repudiate your own Constitution, which

places the control of army and navy in the hands of your President? You refuse to honor his signature?"

"Listen to me, Mr. Von Kettler!" The voice of the Secretary of State cut like a steel edge. "You totally mistake the temper of the people of this country. We don't surrender, even to worthy adversaries, much less to a gang of common thieves, murderers, and criminals like yourselves. You have been accorded the privilege you sought, that of an envoy, and that was straining the point. Show yourself here again after two minutes have elapsed, and you'll go to the gallows—for keeps."

"Dogs!" shouted Von Kettler, beside himself with fury. "Your doom is upon you even at this moment. I have but to wave my arm, and Washington shall be destroyed, and with her a score of other cities. I tell you you are at our mercy. Thousands of lives shall pay for this insult to my master. I warn you, such a catastrophe is coming as shall show you the Invisible Emperor does not threaten in vain!"

With complete nonchalance the Secretary of State

took out his watch. "One minute and fifteen seconds remaining. Captain Rennell," he said. "At the expiration of that time, put Mr. Von Kettler under arrest. I advise you to go back to your master quickly, Mr. Von Kettler," he added, "and tell him that we'll have no dealings with him, now or ever."

For a moment longer Von Kettler stood glaring; then, with a laugh of derision and a gesture of the hands he vanished from view. And, though they might have expected that denouement, the members of the Council leaped to their feet, staring incredulously at the place where he had been. Nothing of Von Kettler was visible, not even the eyes, and there sounded not the slightest footfall.

Dick sprang forward to the door, but his outstretched arms encountered only emptiness. In spite of the Secretary of State's instructions, he was almost minded to apprehend the man. If he could get him!

The corridor was empty. A guard of soldiers was at the entrance, but they did not block the entrance. Even now Von Kettler might be passing them! Why

didn't his feet sound upon the floor? How could a bulky man glide so smoothly?

Perhaps because Dick was undecided what to do, Von Kettler escaped him. By the time he reached the guards he knew he had escaped. Suddenly there came an unexpected denouement. Somewhere on the White House lawn a guard challenged, fired. The snap of one of the silenced automatics answered him.

When Dick and the guards reached the spot, the man was lying in a crumpled heap.

"An airplane," he gasped. "Invisible airplane. I—bumped into it. Men—in it. The damned dogs!"

He died. Dick stared around him. There was no sign of any airplane on the lawn, nothing but the tents of the guards, white in the moonlight, and the grim array of anti-aircraft guns that Dick had placed there.

But behind the White House, in hastily constructed hangars, were a half-dozen of the latest pursuit airships—beautiful slim hulls, heavily armored, with

armored turrets containing each a quick-firer with the new armor-piercing bullets. One of these ships, Dick's own, was kept perpetually warmed and ready to take the air.

Dick raced across the lawn, yelled to the startled guard in charge. The mechanics came running from their quarters. Almost by the time Dick reached it the ship was ready.

He twirled the helicopter starter, and she roared and zoomed, taking an angle of a hundred and twenty-five degrees upward off a runway of twenty yards. Into the air she soared, into the moonlight, up like an arrow for five hundred feet.

Dick pulled the soaring lever, and she hung there, buzzing like a bee as her helicopters, counteracting the pull of gravity, held her comparatively stable. He scanned the air all about him.

Washington lay below, her myriad lights gleaming. Immediately beneath him Dick saw the guns and the tents of the soldiers, and the little group that was

removing the body of the murdered soldier on a stretcher. But there were no signs of any hostile craft.

Had the murdered man really bumped into an invisible airship, or had he only thought he had? Had those devils learned to apply the gas to the surfaces of airplanes? There was no reason why they should not have done so.

But surely the utmost ingenuity of man had not contrived to render a modern plane, with its metalwork and machinery, absolutely transparent?

And, again, how was it possible to have silenced the sound of engines, the whir of a propeller, so that there should be no auditory indication whatever of a plane's presence?

Dick looked all about him. Nothing was in the air—he could have sworn it. He replaced the soaring lever and banked in a close circle, his glance piercing the night. No, there was nothing.

Crash! Boom! The plane rocked violently, tossing

upon gusts of air. A huge, gaping hole of blackness had suddenly appeared in the middle of the White House lawn. The tents were flat upon the ground. Through the rising smoke clouds Dick saw tongues of flame.

No shell that, but a bomb, and dropped from the skies less than five hundred feet from where Dick hovered. Yet there was nothing visible in the skies save the round orb of the moon.

A rush of wind past Dick's face! One of the vanes of the helicopter crumpled and fluttered away into the night. Dick needed no further persuasion. The dead soldier had not lied.

Von Kettler had begun the fulfillment of his threat!

Chapter 5: The Enemy Strikes

As Dick's airship veered and side-slipped, he kicked hard on the left rudder and brought the nose around. Furiously he sprayed the air with a leaden hail from his quick-firer. He heard a rush of wind go past him, and realized that his unseen antagonist had all but rammed him.

Yet nothing was visible at all, save the moon and the empty sky. He had heard the rush of the prop-wash, but he had seen nothing, heard nothing else. Incredible as it seemed, the pilot was flying a plane that had attained not merely invisibility but complete absence of all sound.

Dick side-slipped down, pancaked, and crashed. He emerged from a plane wrecked beyond hope of early repair, yet luckily with no injury beyond a few minor bruises. He rushed toward the hangar, to encounter a bevy of scared mechanics.

"Another plane! Rev one up quick!" he shouted.

Planes were already being wheeled out, pilots in flying suits and goggles were striding beside them. Dick ordered one of them away, stepped into his plane, and in a moment was in the air again.

In the minute or two that had elapsed since the encounter, the enemy had been active. Crash after crash was resounding from various parts of Washington. Buildings were rocking and toppling, débris strewn the streets, fires were springing up everywhere. A thousand feet aloft, Dick could see the holocaust of destruction that was being wrought by the infernal missiles.

Bombs of such power had been the unattained ambition of every government of the world—and it had been left to the men of the Invisible Emperor to attain to them. Whole streets went into ruin at each discharge and from everywhere within the city the wailing cry of the injured went up, in a resonant moan of pain.

In the central part of the city, the district about F Street and the government buildings, nothing was

standing, except those buildings fashioned of structural steel, and these showed twisted girders like the skeletons of primeval monsters, supporting sections of sagging floors. Houses, hotels had melted into shapeless heaps of rubble, which filled the streets to a depth of a dozen yards, burying everything beneath them. Yet here and there could be seen the forms of dead pedestrians, motor-cars emerging out of the débris, lying in every conceivable position; horses, horribly mangled, were shrieking as they tried to free themselves. And yet, despite this ruin, the general impression upon Dick's mind, as he beat to and fro, signaling to his flight to spread, was that of a vast, empty desolation.

Further away: where the ruin had not yet fallen, thousands of human beings were milling in a mass, those upon the fringes of the crowd perpetually breaking away, other swarms approaching them, so that the entire agglomeration resembled a seething whirlpool turning slowly upon itself.

Then of a sudden the strains of the national anthem floated up to Dick's ears. A band was playing in the

White House grounds. The tune was ragged, and the drum came in a fraction of a second late, but an immense pride and elation filled Dick's soul.

"They'll never beat us!" he thought, intensely, "with such a spirit as that!"

He had signaled his flight to spread, and search the air. He could see the individual ships darting here and there over the immensity of the city, but none knew better than he how fruitless their effort was. And the marauders had not ceased their deadly work.

A bomb dropped near the Washington Monument, sending up a huge spout of dust that veiled it from his eyes. Instinctively Dick shot toward the scene. Slowly the dust subsided, and then a yell of exultation broke from Dick's lips. The noble shaft still stood, a slim taper pointing to the skies.

It was an omen of ultimate success, and Dick took heart. No, they'd never beat the grim, unconquerable tenacity of the American people.

Yet the damage was proceeding at a frightful rate. A bomb dropped squarely on the Corcoran Gallery and resolved it into a heap of silly stones. A bomb fell in the middle of Pennsylvania Avenue, and the houses on either side collapsed like houses of cards, falling into a sulphurous, fiery pit. And still there was nothing visible but the sky and the moon.

Dick gritted his teeth and swore as he circled over the site of destruction, out of which tiny figures were struggling. He heard the clang of the fire bells as the motor trucks came roaring toward the scene. Then crash! again. Five blocks northward another dense cloud of dust arose, and the new area of destruction, spreading as swiftly as ripples over a pond, joined the former one, leaving a huge, irregular open space, piled up with masonry and brick in a number of flat-topped pyramids.

Into this, houses went crashing every moment, with a sound like the clatter of falling crockery, but infinitely magnified.

"The devils! The swine!" shouted Dick. "And we gave

Von Kettler the privileges of an ambassador!"

And Fredegonde was the sister of this devil! The remembrance of that struck a cold chill to Dick's heart again. He tried to blot out her picture from his mind, but he still saw her as she had appeared that day after the air ride, flushed, smiling, radiant in her dark beauty.

A murderess and a spy! He cursed her as he banked and circled back. He was helpless. He could do nothing. And all Washington would be destroyed by morning, if the supply of bombs kept up. But there was more to come. Suddenly Dick became aware that two of his flight, at widely separated distances, were going down in flames. Flaming comets, they dropped plump into the destruction below. Another caught fire and was going down. No need to question what was happening.

The invisible enemy was attacking his flight and picking off his men one by one!

He drove furiously toward two of his planes whose

erratic movements showed that they were being attacked. As he neared them he saw one catch fire and begin its earthward swoop. Then the fuselage crackled beside him, and his instrument board dissolved into ruin. Instinctively he went round in a tight bank and loosed his machine-gun. Nothing there! Nothing at all! Yet his right wing went ragged, and his own furious blasts into the sky, their echoes drowned by the roar of his propeller, were productive of nothing.

He shot past the uninjured plane, signalling it to descend. He wasn't going to let his men ride aloft to helpless butchery. Nothing could be done until some means was discovered of counteracting the enemy's terrific advantage.

He darted across the heart of the city to where another of the flight was circling, wagging his wings to indicate to it to descend. Then on to the next plane and the next, shepherding them. Thank God they understood! They were bunching toward the hangar. Yet another took fire and dropped, a burning wreck. Half his flight out of commission, and not an enemy

visible!

He was aloft alone now, courting death—instant, invisible death. He wouldn't descend until that carnival of murder was at an end. But it was not at an end. Another crash, far up Pennsylvania Avenue, showed an attempt upon the Capitol. Again—again, and a smoking hell wreathed the noble buildings so that it was no longer possible to see them. A lull, and then a crash nearer the city's heart. Crash! Crash!

Invisible though the enemy was, it was easy to trace the movements of this particular plane by the successive areas of destruction that it left behind it. It was coming back over Pennsylvania Avenue, dropping its bombs at intervals. It was methodically wiping out an entire section of Washington.

Dick drove his plane toward it. There was one chance in a thousand that, if he could accurately gauge the progress of his invisible antagonist, he could crash him and go down with him to death. If he could get close enough to feel his prop-wash! A wild chance, but Dick's mind was keyed up to desperation. He shot

like an arrow toward the scene, with a view to intercepting the murderer.

Then of a sudden he became aware of a curious phenomenon. A black beam was shooting across the sky. A black searchlight! It came from the flat top of a large hotel that had somehow escaped the universal destruction, and, with its gaunt skeleton of structural steel showing in squares, towered out of the ruin all about it like an island.

It was from here that the black beam started. It spread fanwise across the sky. But it was not merely blackness. It was utter and impenetrable darkness, cleaving the sky like a knife. Where it passed, the rays of the moon were extinguished as fire is extinguished by water.

A beam of absolute blackness, that pierced the air like a widening cone, and made the night seem, by contrast, of dazzling brightness along either dark border.

High into the air that dark beam shot, moving to and

fro in the sky. Dick, darting toward the spot where he hoped to find his invisible enemy, found himself caught in it.

In utter, inextinguishable darkness! Like a trapped bird he fluttered, hurling himself this way and that till suddenly he found himself blinking in the dazzling light of the moon again, and the black beam was overhead.

Crash! Another widening sphere of ruin as the invisible marauder dropped a bomb. Dick cursed bitterly. Trapped in that black beam, he had lost his direction. The invisible plane had shot past the point where he had hoped to intercept it.

He flung his soaring lever, and hung suspended in the air. An easy mark for the enemy, if he chose to take the opportunity. No matter. Death was all that Dick craved. He had seen half his flight wiped out, and a hundred thousand human beings hurled to destruction. He wanted to die.

Then suddenly a wild shout came to his ears, as if all

Washington had gone mad with triumph. And Dick heard himself shouting too, before he knew it, almost before he knew why.

For overhead, where the inky finger searched the sky, a luminous shape appeared, a silvery cigar, riding in the void. The finger missed it, and again there was only the moonlight. It caught it again—and again the whole devastated city rang with yells of derision, hate, and anger as the black beam held it.

It held it! To and fro that silvery cigar scurried in a frantic attempt to avoid detection, and remorselessly the black beam held it down.

It held it down, and it outlined it as clearly as a figure on the moving picture screen. Then suddenly there came a flash, followed by a dull detonation, and a black cloud appeared, spreading into a flower of death near the cigar, and at the edge of the black beam. The cheers grew frantic. The anti-aircraft battery in the White House grounds had grasped the situation, and was opening fire.

To and fro, like a trapped beast, the cigar-shaped airplane fled. Once it seemed to escape. It faded from the edge of the black finger—faded into nothingness amid a roar of excretion. Then it was caught and held.

Truncated, bounded by an arc of sky, the black finger followed the murderer in his flight remorselessly. And all around him the anti-aircraft guns were placing a barrage of death.

He was trapped. No need for Dick to rush in to battle. To do so might call off that deadly barrage that held the murderer in a ring of death. Hovering, Dick watched. And then, perhaps panic-stricken, perhaps rendered desperate, perhaps through sheer, wanton courage that might have commanded admiration under nobler circumstances, the airship turned and drove straight in the direction of the battery, dropping another bomb as she did so.

It fell in a crowded street, swarming with spectators who had clambered upon the fallen débris, and it wrought hideous destruction. But this time there was

hardly a cry—no unison of despair such as had come to Dick's ears before. The suspense was too tense. All eyes watched the airship as, seeming to bear a charmed life, she drove for the White House itself, through a ring of shells that widened and contracted alternately, with the object of placing a last bomb squarely upon the building before going down in death. And all the while the black searchlight held it.

Dick Rennell was to experience many thrilling moments afterward, but there was never a period, measurable by seconds, yet seeming to extend through all eternity—never a period quite so fraught with suspense as, hovering there, he watched the flight of that silvery plane speeding straight toward the executive mansion while all around it the shells bloomed and spread. It was over the White House grounds. The arches had failed; they were being outmaneuvered, they could not be swung in time to follow the trajectory of the plane. Dick held his breath.

Then suddenly the silvery ship dissolved in a blaze of fire, a shower of golden sparks such as fly from a

rocket, and simultaneously the last bomb that she was to drop broke upon the ground below.

Down she plunged, instantly invisible as she escaped the finger of the black beam; but she dropped into the vortex of ruin that she herself had created. Into a pit of blazing fire, criss-crossed by falling trees, that had engulfed the battery and a score of men.

Then suddenly Dick understood. He flung home the soaring lever, banked, and headed, not for the White House, but for the flat roof of the hotel from which the black searchlight was still projecting itself through the skies. He hovered above, and dropped, light as a feather, upon the rooftop.

There was only one person there—an old man dressed in a shabby suit, kneeling before a great block of stone that had been dislodged upward from the parapet and formed a sort of table. Upon this table the old man had placed a large, square box, resembling an exaggerated kodak, and it was from the lens of this box that the black beam was projecting.

Dick sprang from his cockpit as the old man rose in alarm. He ran to him and caught him by the arm.

"Luke Evans!" he cried. "Thank God you've come back in time to save America!"

Chapter 6: The Gas

In the Blue Room of the White House the Council listened to old Luke Evans's exposition of his invention with feelings ranging from incredulity to hope.

"I've been at work all the time," said the old man, "not far from here. I knew the day would come when you'd need me. I put my pride aside for the sake of my country."

"Tell us in a few words about this discovery of yours, Mr. Evans," said Colonel Stopford.

Luke Evans placed the square black case upon the table. "It's simple, like all big things, sir," he answered. "The original shadow-breaking device that I invented was a heavy, inert gas, invisible, but almost as viscous as paint. Applied to textiles, to inorganic matter, to animal bodies, it adheres for hours. Its property is to render such substances invisible by absorbing all the visible light rays that fall upon it, from red to violet. Light passes through all

substances that are coated with this paint as if they did not exist."

"And this antidote of yours?" asked Colonel Stopford.

"Darkness," replied Luke Evans. "A beam of darkness that means absolute invisibility. It can be shot from this apparatus"—he indicated the box upon the table. "This box contains a minute portion of a gas which exists in nature in the form of a black, crystalline powder. The peculiar property of this powder is that it is the solidified form of a gas more volatile than any that is known. So volatile is it that, when the ordinary atmospheric pressure of fifteen pounds to the square inch is removed, the powder instantly changes to the gaseous condition."

"By pressing this lever"—Evans pointed at the box—"a vacuum is created. Instantly the powder becomes a gas, which shoots forth through this aperture with the speed of a projectile, taking the form of a beam of absolute blackness. Or it can be discharged from cylinders in such a way as to extend over a large area within a few minutes."

"But how does this darkness make the invisible airships luminous?" asked Stopford. "Why does not your darkness destroy all light?"

"In this way, sir," replied the old inventor. "The shadow-breaking gas with which the airships are painted confers invisibility because it absorbs sunlight. But it does not absorb the still more rapid waves, or oscillations which manifest themselves as radio-activity. On the contrary, it gathers and reflects these.

"Now Roentgen, the discoverer of the X-ray, observed that if X-rays are allowed to enter the eye of an observer who is in complete darkness, the retina receives a stimulus, and light is perceived, due to the fluorescent action of the X-rays upon the eyeball.

"Consequently, by creating a beam of complete darkness, I bring into clear visibility the fluorescent gas that coats the airships; in other words, the airships become visible."

"If a light ray is nullified upon entering the field of

darkness, will it emerge at the other edge as a perfect light ray again?" asked Stopford.

"It will emerge unchanged, since the black beam destroys light by slightly slowing down the vibrations to a point where they are not perceived as light by the human eye. On emerging from the beam, however, these vibrations immediately resume their natural frequency. To give you a homely parallel, the telephone changes sound waves to electric waves, and re-converts them into sound waves at the other end, without any appreciable interruption."

"Then," said Stopford, "the logical application of your method is to plunge every city in the land into darkness by means of this gas?"

"That is so, sir, and then we shall have the advantage of invisibility, and the enemy ships will be in fluorescence."

"Damned impracticable!" muttered Stopford.

"You seriously propose to darken the greater part of

eastern North America?" asked the Secretary for War.

"The gas can be produced in large quantities from coal tar besides existing in crystalline deposits," replied Luke Evans. "It is so volatile that I estimate that a single ton will darken all eastern North America for five days. Whereas the concentration would be made only in specific areas liable to attack. The gas is distilled with great facility from one of the tri-phenyl-carbinol coal-tar derivatives."

Vice-president Tomlinson was a pompous, irascible old man, but it was he who hit the nail on the head.
